Published Date: December, 2018

Dear Guests...

Welcome to the 9th INTE, ITICAM & IDEC -2018.

International Conference on New Horizons (INTE), International Trends and Issues in Communication & Media Conference (ITICAM) and International Distance Education Conference (IDEC) are international academic conferences for academics, teachers and educators. They promote the development and dissemination of theoretical knowledge, conceptual research, and professional knowledge through conferences activities, the conference proceedings books and TOJET, TOJDEL and TOJNED Journals. Their focus is to create and disseminate knowledge about new developments in these academic fields.

INTE, ITICAM & IDEC conferences are now well-known international academic events and the number of paper submissions and attendees are increasing every year. This year our conferences have received more than 900 applications. The Conference Academic Advisory Board has accepted approximately 600 papers to be presented in Paris, France.

We would like to thank Prof. Dr. Mehmet Ali YALÇIN, Rector of Sakarya University and the President of the Association of Quality in Higher Education Prof. Dr. Muzaffer ELMAS, for their support of organizing these conferences.

We also would like to thank our distinguished guests, keynote speakers for their collaborations and contributions for the success of these conferences.

And finally, we would like to thank to all of our participants who have presented their academic works in INTE, ITICAM and IDEC- 2018, Paris, France.

Without their participation, INTE, ITICAM & IDEC-2018 would, of course, have been impossible.

We would like to sincerely thank all of you for coming, presenting, and joining in the academic activities.

We would also like to thank all of those who have contributed to the reviewing process of INTE, ITICAM & IDEC conference papers, which will be also published in TOJET, TOJNED, TOJDEL and TOJCAM.

Finally, we would like to wish you all a successful conference, pleasant stay in Paris, France.

Thank you

July 18, 2018 - Paris, France

Abstract

The aim of this research is to examine the views of the students taking Instructional Technology and Material Design course. In this study, one of the qualitative research approaches, "special case study method was used, and the obtained data were collected by" semi-structured student interview form. The analysis of the qualitative data was evaluated by the content analysis method.

The aim of this course is social development, the perspective of educational environment, material development project, material use competencies and the reasons for seeing the teacher training program. It also analyzes the demographics.

The study group of this research consists of a total of 200 students studying at the faculties of Near East University, Sports Sciences.

Introduction

Nowadays, the candidates in the teaching department of the universities are taking courses in the education faculties they study in order to gain the skills and behaviors required in their professional life after graduation. These courses offered in the faculties aim to provide students with the necessary competencies for their own fields as well as having sufficient equipment and confidence in the field. It is seen that one of the educational courses, Instructional Technology and Material Design course is one of the important courses in the teaching formation.

Teaching is the regulation of information and the environment to create learning in general. The environment includes not only the place where teaching is, but also the methods, techniques and tools necessary to convey information and direct the student's work. Information and the environment may also vary depending on the teaching objective in the program. Learning is a product of life and a relatively permanent track behavior change.

There should be an environment for learning-teaching. It is important to create appropriate environments in order to provide training that is considered as a process of behavior change. The field of learning-teaching is called the training environment (Soytekini & Yinal, 2017). Educational environments should be differentiated according to the conditions of the individuals to be educated. A different educational environment should be established for the courses in each level of schools, programs and programs in schools. It can easily be said that if the school, building classrooms and laboratories and the teaching technology and materials are not available or if they are inadequate and almost identical, the educational environment is not suitable.

In general terms, the communication between the sender and the receiver is called a communication that is shared with a shared shopping relationship. This process starts with the message being sent to the recipient by the source and ends with the recipient receiving and evaluating this message and reacting accordingly. A number of behaviors must be performed to achieve communication. There are five basic elements to be considered when examining the communication process. These; source, message, channel, receiver, and return. The source of the communication process in education is the teacher and the recipient. The content of the message program is the textbook or the voice of the teacher, the teaching process of the channel or the methods, technical tools and materials used in the process. Teachers benefit from three types of communication methods. These types of communication are communication with the help of oral, non-verbal and other technological equipment. In order to be a good educator in the education system, it is necessary to know the communication process very well. In the teaching-learning process, a trainer needs to establish a healthy communication with his / her students in order to teach an issue effectively. Communication related to education is related to the interaction of the student and the environment. Detection occurs when the student's senses respond to the message and the effect of the message. As long as individuals reach the consciousness of themselves and the world, it is called perception.

Technology and materials can be made more economical. With the teaching of technology and materials, less time is spent to determine the needs of students and to adjust the teaching accordingly. Less time spent by teachers and students positively affects the speed and cost of schooling. Fast and more economical schooling means that students should leave the school earlier and learn more about the time they stay at school.

If teachers are uninterested or inadequate about using technology and materials, it can be said that the education program will not be successful in ensuring students' learning. Teachers' attitudes and abilities related to technology and material use are effective in students' learning. Some teachers may not have sufficient knowledge of using technology and materials in their courses. Some teachers may also be reluctant to use new technology and materials. In addition, some teachers feel that it is difficult to use technology and materials, they may feel under pressure, or they can rely more on traditional strategies and traditional technologies and

materials. In order to eliminate all these drawbacks, teachers should be given the necessary information on how to benefit from the products of educational technology. In order to meet the three basic requirements in educational applications, educational technologies and materials are used.

In the faculties of education, pre-service teachers are enabled to feel ready for the profession with affective aspects along with cognitive gains. For this reason, it is important that teacher candidates have positive attitudes towards the ÖTMT course which is one of the teaching professional knowledge courses and they are important in terms of designing materials for their own fields and transferring them to students as appropriate (Akay ve Argün, 2006).

It is thought that the use of a skill that includes complex mental processes in this process by the trainee teachers will contribute positively to the future professional lives of the students and the success of the students. For this purpose, it is considered important to examine the relationship between creativity perception and attitude variables towards the course.

Purpose of the Research

In this research, it is aimed to examine the opinions of prospective teachers about the teaching of Instructional Technology and Material Design (SCT) course in different aspects. For this purpose, the following questions were sought;

1. What are the perceptions of teacher candidates who take Teaching Technologies and Material Design course?
2. What are the material design, self-efficacy belief levels of teacher candidates who take Teaching Technologies and Material Design course?
3. What are the attitude levels of prospective teachers who take Teaching Technologies and Material Design course towards the ÖTMT course?
4. Do the teacher candidates' perceptions of creativity differ according to the department?
5. Are the teacher candidates who take Teaching Technology and Material Design course differentiate according to the department?
6. Is there a meaningful relationship between the creativity perceptions of the prospective teachers who take Teaching Technologies and Material Design course and their attitudes towards Instructional Technology and Material Design course?

Method

Research Model

The aim of this study is to examine the opinions of prospective teachers about the teaching of Instructional Technology and Material Design (ITCT). In order to present the views given in this sense, one of the qualitative research approaches, el Special Case Study i method was used.

In this study, it was carried out with the holistic single case design of the special case study because it was the subject of Instructional Technology and Material Design as a single unit of analysis (Yıldırım & Şimşek, 2005). The case study is carried out in a natural environment, such as a class or an organization, and aims to take a holistic approach to the events and environments that are the subject of the study (Phillips and Burbules, 2000).

Working group

Working group; It is comprised of 300 students studying at Lefke European University in the Turkish Republic of Northern Cyprus. As a sample representing the universe, undergraduate students from the Faculty of Sport Sciences of the European University of Lefke were enrolled.

Data collection tool

In order to determine the attitudes of pre-service teachers who took STSM courses towards ÖTMT course, 2013 Attitude Scale for Instructional Technologies and Material Design Course mek which was developed by Çetin, Bahçeci, Kınay and Şimşek (2013) was used.

Attitude Scale Validity

The first step in the development of the ÖTMTDYTÖ was to examine the literature by the researchers and form a pool of substances with statements indicating attitudes towards the instructional technologies and material design course. The item pool consisted of 46 items. Then, 5 experts in the field of educational sciences were interviewed for the superficial (appearance) and scope validity of the scale. According to expert opinions, 5 items were removed from the scale and 3 items were changed (Çetin, Bahçeci, Kınay and Şimşek, 2013). After these processes, the scale was finalized with a 5-point Likert-type rating, which I strongly disagree (1), I disagree (2), I am undecided (3), I agree (4) and I strongly agree (5). The validity and reliability studies of the scale were conducted on three different groups of students who studied at Ziya Gökalp Faculty of Education in Dicle University in 2012-2013 Fall Semester and who successfully completed the course.

The first group consisted of 358 (174 males, 184 females) in which the construct validity, internal consistency reliability and item analyzes of the Attitude Scale for Instructional Technology and Material Design Course were conducted, and the second group of 79 (42 males, 37 females) in which the compliance validity study was conducted, and the test was repeated. The third group consisted of 106 (52 male, 54 female) students. In order to

conduct the validity study of the scale, Attitude Scale for Instructional Technologies (ÖTYTÖ) which was developed by Metin, Kaleli Yılmaz, Coşkun and Birişçi (2012) was used (Çetin, Bahçeci, Kınay and Şimşek, 2013) Explanatory Factor Analysis for construct validity studies. and Confirmatory Factor Analysis (CFA). The KMO value of the scale was found to be .948 and the Barlett Sphericity test was significant ($p < .05$, $Df = 528$). According to these results, it was determined that the data set was suitable for factor analysis. After the data set was found to be suitable for factor analysis, it was seen that 33 items were collected under 3 dimensions explaining 53,83% of the total variance by AFA as a result of principal components technique and direct oblimin rotation technique. The first dimension is defined as usefulness ve, the second dimension is eci liking etin and the third dimension is called olarak denial boyut (Çetin, Bahçeci, Kınay and Şimşek, 2013). The correlation between the Attitude Scale for Attitudes towards Instructional Technologies and the Correlation Scale for Instructional Technologies were examined. A positive and significant correlation between the two scales was found. 535. The calculated internal consistency (Cronbach Alpha) coefficient was .94 for the whole scale and .78 to .95 for the sub-dimensions of the scale; test-retest reliability was calculated as .90 for the whole scale and .76 to .88 for the sub-dimensions of the scale. The findings obtained from the item analysis show that the corrected item total correlations of the subscales ranged from .319 to .710. (Çetin, Bahçeci, Kınay and Şimşek, 2013)

Data Analysis

Descriptive statistics were used to determine attitude levels and creativity perceptions.

One-dimensional analysis of variance (ANOVA) and multi-dimensional analysis of variance (MANOVA) were used to determine whether there was a significant difference between the attitude levels and creativity perceptions of the students. Pearson correlation coefficient analyzes were performed to determine whether there was a significant relationship between the scores of the scales.

Findings And Comment

In this section, the findings related to the sub-problems of the study were presented and then comments on the findings were discussed and compared with the results obtained in the literature.

The views of prospective teachers studying in the Department of Physical Education and Sports in the instructional technologies and material design course were examined in different dimensions. "Professional (, ili contribution to individual and social development alma," material development project esi, "material use competencies değişim," the necessity of taking the course in the program ", instructional technologies and material design (ÖTMT) has been tried to determine the opinions about the course.

Table 1. Descriptive Statistics On The Creativity Perceptions Of Prospective Teachers Taking Instructional Technologies And Materials Design Course

Creativity scale	N	\bar{x}	SS
The whole scale total score	200	44,07	14,70

When Table 1 is examined, it is seen that the teacher candidates who take the ÖTMT course have arithmetical average value (\bar{x} alan = 44,07) of the points they get from the ar How Much of Your Creator den scale. Based on this finding, when the inin How Much Creativity Scale (score is taken into consideration (0-116), the mean of the answers of the teacher candidates who took the ITMT course on the scale of how much creative they have (\bar{x} = 44,07) is higher than the mean (40-64 points). They have a level of creativity perception.

Table 2. Descriptive Statistics Related To The Attitude Levels Of Teacher Candidates Who Took Instructional Technologies And Materials Design Course Towards ÖTMT Course

Courses at ÖTMT			
	N	\bar{x}	SS
Attitude Scale			
Delectatn	200	3,44	0,85
Abnegatn	200	4,07	0,95
Benefit	200	3,75	0,67
Full Scale	200	3,72	0,63

When Table 2 is examined, the arithmetical average value of the attitude scale for the Instructional Technology and Material Design course (= 3.44); It is observed that the arithmetic mean value (= 4.07) of the sub-dimension and the arithmetic mean value (= 3.75) for the usefulness sub-dimension. Based on these findings, "Attitude Scale for Instructional Technology and Material Design Course boyut is a 5-point Likert-type scale.

It can be said that the average values of the items are positive because the values that can be taken by the items of scale (1) vary between T Strongly Disagree and (5) M Totally Agree and therefore teacher candidates who take the ÖTMT course have developed a positive attitude towards ÖTMT lesson.

Table 3. ANOVA Results Showing Whether Teacher Candidates' Creativity Perception Scores Differ According To Their Sections

Variance Source	Squares	sd	Squares	F	p
	Total		Average		
intergroup	901,916	10	90,192	,410	,941
inter-group	81301,171	190	219,733		
Total	82203,087	200			

$p < 0.05$

Table 3 is examined, it is seen that there is no significant difference between the perception of creativity perception of teacher candidates who took Instructional Technology and Material Design course according to the part studied $F(10, 200) = 0.41$ $p > 0.05$. It can be stated that the teacher candidates' scores on the perception of creativity are not affected by the department variable they study. It is possible to explain the reason for this situation as the teacher candidates are being trained in a similar education system in the faculties of education.

Table 4. MANOVA results showing that teacher candidates' attitude levels towards ÖTMT course differ according to their departments.

p<0,01

Table 5 is examined, it is seen that the teacher candidates' attitude points towards Instructional Technology and Material Design course show a significant difference according to the departments they study [Wilks Lambda (λ) = 0.823; $F(3, 368) = 2.49$ $p < 0.01$. When the usefulness subscale of the Attitude Scale for Instructional Technology and Material Design Course is examined, it is seen that the attitude points of the teacher candidates towards the Instructional Technology and Material Design course show a significant difference according to the departments they studied [$F(10, 370) = 2.74$ $p < 0.01$, $d = 0.07$]. Similarly, when the sub-dimension of the Attitude Scale for Instructional Technology and Material Design Course is analyzed, it is seen that the attitude points of the teacher candidates towards the Instructional Technology and Material Design course show a significant difference according to the departments they studied [$F(10, 370) = 5.76$ $p < 0.01$, $d = 0.14$]. Finally, when the subscale of the Attitude Scale for Instructional Technology and Material Design Course is examined, it is seen that the attitude scores of the teacher candidates towards the Instructional Technology and Material Design course did not show a significant difference according to the departments they studied [$F(10, 370) = 1.35$ $p > 0.05$, $d = 0.04$]. Within the frame of these findings, it is possible to say that teacher candidates who

study in different departments and who take Instructional Technologies and Material Design course have differences in teaching technologies and material design, and find differences in their level of enjoyment.

Table 6. Pearson Correlation Analysis Results Showing Whether There Is A Significant Relationship Between The Teachers' Perceptions Of Creativity And Their Attitudes Towards Instructional Technologies And Material Design Course.

	NKY	YD
NKY	-	
YD	,070

YR	,046	,247**
BMH	,121*	,121*
ÜBMT	,068	,155**
BMT	,149**	,085

*p< .05; **p< .01

Not: NKY: How creative are you; YD: repudiation; H: Ho lanma; YR: Yararlılık

When Table 6 is examined, it is seen that there is a low, positive and significant relationship between the self-efficacy belief levels and the creativity scores of two-dimensional material design from the sub-dimensions of düzey Material Design Self-Efficacy Belief Scale boyut. = 0.15, $p < 0.01$); Although it was seen that “Material Design Self-Efficacy Scale δ was a positive and significant relation between self-efficacy belief levels and creativity levels about computer material preparation sub-dimension ($r = 0.12$, $p < 0.05$). There is no significant relation between self-efficacy belief levels and creativity levels for three-dimensional material design ($r = 0.07$, $p > 0.05$) (see Table 4.9). According to this, it can be said that pre-service teachers have an increase in their level of creativity, or that an increase in their level of creativity affects the level of self-efficacy belief in material design.

Discussion, Conclusion And Suggestions

In an accreditation study conducted in the USA, the awareness of the technology and materials used in the teaching of the faculty members in the university and the evaluation made in the course of the course showed that the instructors' technology awareness and use on the basis of fields differed (Hora and Holden, 2013). This result is effective in the emergence of differences in the application of ÖTMT course which teacher candidates receive by field educators or educational sciences expert.

Uncovered in studies with teachers in Turkey; negative results such as inadequacy, self-confidence and lack of knowledge, theoretical method and similar results were also observed in studies conducted abroad. As a result of a study conducted by the Office of Technology Assessment in America, teachers and candidates stated that they felt they were inadequate in instructional technologies, did not receive effective training in in-service training, and did not learn the technologies to be included in the teaching (Yanpar, 2011). In addition to this evaluation, it was found that 75% of the universities in the study conducted by the researchers in some states was not a subject related to instructional technology in teacher education (Yanpar, 2011).

Yaman materyalin (2007) in his study with the Turkish teachers stated that they felt inadequate in terms of material design in their fields. It should be noted that the field educator's contributions to the candidates on their professional gains. English teachers who take the ÖTMT course from the education sciences specialist and the other instructors are the most ineffective gain of the course. Erol (2012) 's) Elementary Education II. In this study, it was found that there was no significant difference between the use of instructional technologies and the use of instructional technologies according to gender variable. It is thought that male teachers in the sample may be more interested in using technology than women, and this situation is reflected in education-training environments.

In his study, farklılık A Study of the Instructor of Technology Integration in the Classroom. Draheim and Weber, (2005). he found no significant difference in the use and integration of technology according to gender variable. This result may be due to the fact that 84% of the participants were male and 16% were female. As a result of the study of Dobbins, (2009) there was a difference between teachers' views in terms of gender variable. In the study there is a difference between the use of educational technologies and differences in the use of computers, books, multimedia, audio cassettes, tapes and data projections. According to this, it is concluded that male teachers say that they use more new technologies such as computers and multimedia compared to female teachers.

In a study by Dikici and Sağnak (2010), it was found that the teaching proficiency scale had a positive but low correlation ($r = .126$) between the general teaching sub-dimension and attitudes towards teaching profession, and this correlation decreased when other variables were controlled ($r = .125$).). In addition, it was found that there was a low negative relation between the sub-dimensions of the competency scale and the attitude towards individual teaching and teaching profession ($r = -.124$) and a low negative relationship between the self-confidence of the other sub-dimension and the attitude towards the teaching profession ($r = -.007$). Similarly, in a study conducted by Çelikkaleli and Akbaş (2007), it was found that teacher candidates' self-efficacy beliefs about science teaching accounted for 39% of the attitude variance towards science lesson. In addition, in a study by Özkal (2013), it was found that 6th and 7th grade students' self-efficacy beliefs towards Social Studies course were a strong predictor of positive attitudes. It was found that the self-efficacy belief scores for the Social Studies course could explain 16% to 22% of the variance in the positive attitude towards the Social Studies course. In this context, it is possible to say that there is a similarity between the findings of the eighth sub-problem and the findings from the literature.

Abstract

Educational research has pointed out the problem of rote-learning and the effect of concerning conceptual teaching and learning. Lecture activities in this environment students need to consider this aspect while constructing any task by themselves and teachers must develop teaching activities where this is possible in classes. We present in this study analysis of the classifications with creative reasoning applied to vocational school students. This study focused the model established by Lithner (2008) that discriminates between derivative reasoning that linked to efficient learning of algorithms and concepts, and creative reasoning that includes conceivable math originated opinions. The study includes the investigation of records, lecture textbook, coursework and examinations applied to basic mathematics classes in from different three universities in Turkey with the view to classifying the types of reasoning expected of the students. More over explaining of our application model to Lithner's method, also we focuses validity of the method used a basic factor in this study for categorizing reasoning alternative conditions in our mathematics classes.

Keywords: vocational school, mathematical reasoning, lithner's method

Introduction

There are many mental abilities for students that has a powerful role directly to affect students' mathematics learning but powerful and useful mental activities and non-classic problem-solving skill that known to be closely connected to math accomplishment (Swanson & Alloway, 2012). Educational studies of students' mathematical proving had also positive effected conceptual context of mathematical verifying for better presentation of the different views of students' ability in mathematical demonstrating. The other way involved in students' assessment of math confirmations and rational understanding of many confirmation styles (Antonini & Mariotti, 2008; Harel & Sowder, 1998; Selden & Selden, 2003; Stylianides & Stylianides, 2009). The reporting studies has partial effects of logic training, but, didn't discover the use of arithmetical and algebraic examples as an different of logic training and the effects of such an education program on students' justification of mathematica proofs and rational information of different proof approaches (Bhairst at all., 2008; Unsworth and Engle, 2005).

Calculating skills and routine learning of mathematical rules also necessary for an efficient problem-solving process, since the focus can be settled in the task at widely changing of each small subjects. The connection between some reasoning procedures and math reasoning is basic motif of the results of our experiments in this study (Norqvist, 2016). Lithner (2008) gives reasoning as 'the line of thought adopted to produce assertions and reach conclusions in task - solving'. This description has powerful and ordered or simple points and could not be limited to general analyze of mat theorems. The method is suitable in working the mental analyse procedures needed to explain difficulties in basic mathematics classes, that usually confirmations of the theorem are not presented, in this step learners should compose a simple configuration to make reasonable opinions and decisions during their tasks. Lithner give main differences between imitative reasoning that is connected to repetition education and impression of numerical calculating and imaginative reasoning that includes reasonable math-based opinions. In this study, it is applied the context to categorize the reasoning prospects obtainable in the context of business mathematics offered in the three universities (Bhairst at all., 2008). We are using classes for expert and non-expert students, More over essential and non-essential modules.

Many process and procedure in mathematics are remembered for fast and unforced in lecture. For example, the command of basic operations can be completed to have rapid operation to go to final step. But this operational format can also convert to a big problematic situation if it happens without understanding the main idea. Rote learning can be defined as a mechanical repetition of the learning concept (Mullis, Martin and Arora, 2012).

According to the education researchers, transition from high school (or college) to university is generally recognized as a difficult and painful process and learners usually accept that the transition in mathematics and science classes is especially difficult and a challenging journey (Boesen and Lithner, 2010). Students' problems in first year mathematics turn out to be conceptual approach rather than concrete presentation of mathematics teacher (Gueudet, 2008; Fucawa-Connelly, 2005). Students' problems are especially cognitive understanding of the concepts such as complex numbers, special function, derivative, and deeply analyzing of definition of these concepts and their long and abstract proofs. These basic concepts of vocational school mathematics are also used extensively from the students with the departments such as engineering, physics, biology, some social programs. It is a well-known and famous math approach that the study of mathematics be efficient step by step with the development of abstract thinking skills (Clark and Lovric, 2009; Lithner, 2008; Bhaird et al., 2008).

Conceptual Framework

When rote learned notions convert the core information, learners would not answer problems that have changed views from instructor's sample or textbook's application (Weber, 2001). Mathematical proofs are crops of mathematical demonstrating. Moreover, we prefer to use the term "Mathematical Proving" in this study had used with proof constructions (Harel & Sowder, 1998; Weber, 2001). This skill had been planned as a significant for students' proof and demonstrating (Alcock & Weber, 2005; Selden & Selden, 2003; Bhaird et al., 2008).

In this study, some kind of questions is learners' work equipment's during the investigation period. Lithner (2008) clarified differences between imitative and creative reasoning. Imitative reasoning has the following key forms: memorized and algorithmic. In order to be grouped as memorized a reasoning technique should have involved the following steps: a). The tactic choice is investigated on focusing a whole response. b) The tactic application wants to have the recording version (Bhaird et al., 2008).

The reasoning endorsed by the mission is connecting on the learners' previous information and the textbook, direction, or examples. Learners' reasoning classification going on with the presented mission by their teacher and going on to a response that is the creation of the mission (Norqvist, 2016). The creative reasoning organization can be separated into two subclasses (Dreyfus, 1991): Local creative reasoning; and Global creative reasoning. A problem set is recognized "need local creative reasoning" if it is answerable using any math algorithm but the it wants to be adapted by a math algorithm locally. A problem group is recognized "need global creative reasoning" if the problem doesn't have an explanation that is created on any math algorithm and requires creative reasoning. This kind of reasoning is usually presented at the vocational school level when students are requested to remember a math concept, to state an axiom and a proof of specific theorem (Bhaird et al., 2008). Lithner (2008) gives a reasoning application for creative view if it has the following three types:

- i. An original reasoning arrangement is activated: Novelty
- ii. Performing of opinions is essential to study on a strategy. This inspires learners be aware of that the decisions are true or not true: Plausibility.
- iii. Background level of student's ideas for the accomplishment of the strategies: Mathematical foundation.

Method

In this study, we applied a question paper from mathematics classes of the different departments of three vocational schools in Turkey. The classes contain the mathematics elements. These modules were constructed from the mathematics classes presented to vocational school students. The data in the study contain of the next kinds of question models: classroom notes, textbooks problems, exercises and different questions types. It was grouped all the information with the collaboration of the module lecturers. The data analysis of every element is being directed by the authors of this article (Bhaird et al., 2008).

The exploration method confirms consistency of the analysis of the lecture material from the modules used for this study. We first made the analyzing of the categorization of the examples and problems from our lecture textbook, in order to gain some experience and test our classification methods. These procedures were presented by Lithner (2008). He first constructs an answer to the task and later related them to the lecture papers and text exercises. By focusing his/her context, we examine that the task would be answered by means of algorithmic reasoning and the creative reasoning is required for the analysis. In this period, we observed that the most problematic choices are related about the organization of tasks into the local creative reasoning and we planned the framework as the way that: we define that we could modify a problem as local creative reasoning if the local creative reasoning was settled on an mathematical algorithm (Bhaird et al., 2008; Norqvist, 2016).

Analyses and Findings

We present some examples of tasks designed by the researcher classified using the Lithner reasoning framework. We concentrate on a main subject to be comprehensible status and to be more confidence to relating groups. We select the topic of rational equations, that is important in many basic mathematics classes. In the course for a question, the classroom documents and the textbook examples of rational equations using the quadratic formulas (Bhaird et al., 2008). Moreover, we present some examples that exemplify the methods planned for this study.

Task 1: Solve the following rational equations, give your answers with different format if it is possible.

- (a) $x^2 - 12x + 35 = 0$;
- (b) $x^2 - 4x - 1 = 0$;
- (c) $6x^2 - 24 = 0$;
- (d) $x^2 - 10x + 25 = 0$;
- (e) $x^2 + 6x + 10 = 0$;
- (f) $x^2 - 12x + 150 = 8x + 54$.

Analysis of the parts of the Task 1:

In this question, students are expected to use the quadratic formula or factorization of the rational equations.

- a) $x^2 - 12x + 35 = (x - 5)(x - 7)$, then the solutions are $x = 5, 7$;
- b) by using of the quadratic formula of rational equations, then the final step of the solution is $x = 2 \pm \sqrt{5}$, with other expression, $x = 4.236$, and $x = -0.236$;
- c) $6x^2 - 24 = 4(x^2 - 4) = 2(x - 2)(x + 2)$, so the solutions are $x = -2, 2$;
- d) $x^2 - 10x + 25 = (x - 5)^2$, so there is just unique solution at $x = 5$;
- e) using the quadratic formula we have $x = -3 \pm \sqrt{-1}$, so there are no real solution;
- f) subtracting $8x + 54$ from both sides gives $x^2 - 20x + 96 = 0$ and since $x^2 - 20x + 96 = (x - 8)(x - 12)$, the solutions are $x = 10, 14$.

Result

Mathematics students employed much time to apply of the tasks. It is significant to study with these tasks from a learning perspective. It is vital the advance of basic math abilities such as creative reasoning of student that transfer students to powerful and solid mental levels and their assignation with the educational procedure. In this paper, it was focused, to understand student mental processing, an analysis of the classifications study for creative reasoning approach applied to vocational school students. We need to note that the analysis of all questions used for this research for the different classrooms has not been presented in this paper. Thus, we don't give full finding of the research question in the section of findings (Bhaird at all., 2008).

Mathematics and Vocational School Students

Sinan AYDIN

Kocaeli University, Kocaeli Vocational School, Turkey
sinanaydin1704@yahoo.com

Abstract

In this paper, we analyse the situation that what are the ways of finding of vocational schools of young students, children and people, if there is a relation between academic study level and determining the schools or is not a main factor, what is the creating of mathematical idea for vocational school students. This paper underlined regular research discipline research type with a methodological approach. The analyse way declined research design of Likert-type questionnaires for the account department student's selectin for this study from a vocational school in Turkey. A total 225 students were the study group of this study. The findings coming from this special school showed that there was a necessary and vital for a special curriculum program for students focusing on basic knowledge taught in their school and skills and organising the context of the mathematics curriculum applicable towards students' situation. As a result of this analyse, teachers face some important and tedious problems specific to the student group in their department in their school. They usually need to compose more applicable and more efficient schedules for working students in any special work area connection their school program or not. The school Atmosphere as imitated by students' own relation to learning in the classes area the views of the classroom, teachers' teaching, outlooks appears to be non-positive related item. All these necessities may not easy to determine an effective program for school administration. In this paper we have focusing some problems of student that need rectification in mathematics teaching program and learning level in the classroom. Finally we can say that specific teaching approaches of education and working life for vocational school students; focus on teaching for working students' to make more clear of basic knowledge and skills.

Keywords: vocational schools, mathematics, academic problems, students' beliefs

Introduction

Mathematics and all science disciplines are important and vital to the social life, economical conditions and, so progress of modern life a country for all time period of education. The teaching of accounting needs effective and powerful planning to make useful for students and ensure quality education system for the citizen of the country (Bakar at all, 2010; Kılıçaslan at all, 2018; Şeneldir at all, 2017b). While concerted necessities should be taken to educate the every body, we should not lover sight of the motivation of the vocational students. Learning mathematics in their program for vocational students is a phenomenon and interesting subject for some perspectives and does not often occur with clarity (Bakar at all, 2010)

Different factors and elements may cause to learning problems and understanding difficulties coming from student consultation level or motivation problems in mathematics for the students for their education life (Bakar at all, 2010). In all these items are: the scientific knowledge, mathematical language, symbols, difficulties and learning problems relating social conditions in processing mathematics, some visual confusions related to mathematics learning of students, and working life conditions memory and many difficulties, also unusually high anxiety in education life (Bakar at all, 2010; Şeneldir at all, 2017c; Valencia and Black, 2002). Understanding math for vocational students is a start point to feel attention and many schedules have designed learning conditions in all level of education environment which are more insprings even though the process of determining the difficulties of the problems come from all above factors are still at a uploading way (Bakar at all, 2010). Moreover, it is clearly pointed that there are specific needs, and all educational plans should be presented a real and long period of study by researchers ((Bakar at all, 2010).

Research studies for all education programs and especially vocational school education classes show that some difficulties in teaching strategies for learning mathematics are possible with low or much level in the classrooms (Bakar at all, 2010 Wheelage & Rutter, 1989). The all educational problem are, for example, insufficient points that students have relevant background basic knowledge for learning the lesson and rapid rate for introducing many of the concepts. Also, lack of logical level in the presentation of mathematics strategies in the classroom and poor communication and a lack of corporation activity in many instructional activities. Many authors mentioned this lack of motivation a basic negative factor in their studies. Moreover, insufficient teaching practice of teachers to help the students learning from the initial teaching level to make their teaching more effective and interesting to independent learning and insufficient analyse of their teaching periods to motivate them to students awae of that what they have learned at the lectures (Bakar at all, 2010; Koparan at all, 2018; Of at all, 2017; Tola at all, 2017; Şeneldir at all, 2017a; Seit, 2004).

The instructional approaches recommended from mathematic education researchers that implementation of interesting students' learning and to motivate their student learning, understanding levels and learning styles (Bakar at all, 2010; Of at all, 2018; Kahraman at all, 2018; Ernest, 2004; Dalby and Noyes, 2015). Also, application of powerful and effective teaching targets (Battal at all., 2017; Bostan, and Durmuş, 2016; Bostan, and Durmuş, 2017; Durmuş, 2016). The underlined points in this research are:

- To define problems connect to mathematics learning of students
- To determine problems effect to the teaching and learning of mathematics
- To understand learning atmosphere for students in learning the subjects
- To formulate some effective teaching strategies that are known not efficient for the math teaching for this course teachers.

Method

It is used a quantitative, descriptive examination analyzing method, having accounting department students in a vocational school in Turkey. Vocational school students usually refer to students with future academic planning problems and low academic achievement. 225 accounting department students from 1st year and 2nd year class level was used for this study. The students answered two separate 5-point Likert scale questionnaires indicating their level of agreement to specified items in each questionnaire for learning mathematics (Bakar at all, 2010).

Findings

By using of the questionnaire, the data was classified and it was settled that much of the students were male about 60% and the other were female 40%. The classification level of students who had good level academic of academic exam point in the course exams or tests were not good level, mean that 18.41%. Moreover, with the interesting points of student level who passed the tests were not god level, most of them believe that Mathematics were lovable to stud and understand. Our data analyses result showed that approximately 11.0% of student respondents negative feeling for Mathematics (Table 1).

Table 1: Students observation on mathematics

Perception category	Mathematics	
	Frequency	Percentage
Enjoy	136	60.4%
Moderate	61	27.1%
Dislike	28	12.5%
Total	225	100%

The accepting level to questioner items of students totally, they present positive attitudes for the learning conditions in their registered schools (Bakar at all, 2010). According to their basic points, the item which has the maximum level of coordination was 'Most of my teachers taught us with enthusiasm (mean=3.73). This finding give us when lo point students usually would attempt to reach the maximum score possible. Also, a positive answer on the way to the item 'My discipline teacher takes good care of students' (41.5% agreed). In a confident learning environment was produced to questionnaires items to several items, for example 'Almost all of my friends in my class tried to get the best score' (42.2% agreed). 'Teachers always want us to produce good work' (53.6% agreed), 'Students in my school integrate well among them' (52.2% agreed), and 'Most of my teachers taught us with enthusiasm' (41.7% agreed). Most of the finding in this step are less or more confident the result of our scale reference (Bakar at all, 2010). Generally, the findings showed that the students' feelings on the way to the learning enviroment of their schools was the direction of confident level (Table 3).

Result

With this study, it was tried to analyse vocational student feeling or perception against to their learning environment. The result connected to students' feeling of their learning atmosphere explain that most of students are confident or good level score way towards their learning atmosphere as the same the result of our scale reference (Bakar at all, 2010). More over, when items of question are related to students that showed to the negative feelings are detailed the study gave the result that meaningfully minimum level ability their explanations related to the abnormal expressions related to the maximum performance group of accounting department students.

The data give us that students focusing on basic knowledge and abilities and presenting a normal level the content of the mathematics lectures turned the way of students. Moreover, presentation for teaching and practice subjects should be get to students' motivation to their school life. Explicit teaching methods for students were suggested that give more concentration to teaching for the anaFlyse of their information and ability performance, teacher presentation with effective student's active positions, teachers be given additional pedagogical training for teaching of mathematics. Teaching mathematic to vocational school student should be given focusing with regards

to school program and teaching approaches as expressed the same the result of our scale reference (Bakar at all, 2010) .

Abstract

A joint experience, in teaching Mathematics, of the Architectural and Engineering Schools of the Politecnico di Milano and Universidad de Granada is presented.

The results, proposed in Informatics Laboratory, are the applications of the basic knowledge related to the definition and behavior of two-variable functions and of the language of Parametric Geometry. Precisely, mathematical methods providing metamorphosis of tridimensional objects are considered.

The goal is to show how mathematical topics, of a certain difficulty, are actually justified in a historical context and are, therefore, made appreciable through graphic applications of remarkable vivacity and unpredictability.

Keywords: *Laboratory activity; functions of two variables; parametric surfaces*

Introduction

When thinking of Mathematics, one can often think of an arid, however precise composition of numbers, formulas, theorem proofs.

If one is more open minded, one can also think of mathematics as of an indispensable support to the applied sciences, such as Physics, Biology and Chemistry for the observed phenomena simulation.

One rarely considers Mathematics as a free expression of an idea allowing space for imagination and the aesthetic sense. Yet Mathematics means also this, and, mainly this, for some mathematicians. Thus, a certain kind of Mathematics - inasmuch as it is free and abstract - is much closer to Poetry and Music than to the exact and experimental sciences, to which it is commonly associated: *The poet must be able to see what others do not see, he must see more deeply than other people, and the mathematician must do the same ...* (Sofia Kovalevskaya, 1850-1891)

The most significant turning points concerning mathematical thought emerged out of simple but deeply innovative ideas. One example of mathematical expression, certainly originated by imagination more than by logic, is Analytic Geometry. To imagine and to invent how curves, surfaces could be represented not only with the help of drawing instruments and the brush, but also through a few simple mathematical equations, demanded a kind of sensitivity which neither the architect nor the poet possessed, yet still one which, for its characteristics, we can name artistic.

One can naturally make a different use of what has been imagined and then proposed to him/her. (In Poetry, for example, metrics can be considered both as a binding law that, since it must be respected, can lead to correct, irreproachable, albeit sterile results, and as starting point, a hint to create literary masterpieces: it all depends on how somebody's principles are interpreted and elaborated by somebody else). Analytic Geometry, just as metrics, can be used as a means to classify and manipulate acknowledged shapes, but, above all, to elaborate new ones, either already looked for or still unpredictable, thus opening the way to new creative horizons.

Supported by the idea that mathematics can be deemed intrinsically beautiful and creative and that it can project its aesthetic and artistic taste on what it creates, we would like to show, in this paper, how the mathematical ideas acquired in Analysis and Geometry courses from young students in Architecture or Engineering can offer, thanks also to modern technologies, graphic results beautiful and very unusual results.

Through these results it is our belief that students succeed in sympathizing with Mathematics, but above all they are able to become familiar with the real three-dimensional space and be concretely aware of the shape qualities of 3D objects.

Experiments in computer laboratory come from the experiences of two different Universities: Schools of Architecture and Design of Politecnico di Milano and University of Granada Schools of Civil Engineering and Building Engineering.

Functions Of Two Variables: Short Historical Excursus

The history of Mathematics is as fascinating as the life of man, since it has accompanied him throughout his life. We take a quick tour of History, to find out how the concept of function has been developed.

The instrumental nature of Mathematics appears naturally in the Babylonian culture, a group of peoples who lived in Mesopotamia, for the resolution of everyday economic problems: numerical record of assets deposited in temples, geometric calculations, construction of algorithms. In their astronomical studies, they tried to predict certain events, from the observation of various phenomena. We have found tables with squares, cubes and inverses of natural numbers. Undoubtedly, implicitly, these tables define functions of N in N and of N in R .

From the Egyptian Mathematics, the oldest data we have, come from two documents: the Moscow papyrus and the Rhind papyrus (also called by the name of its scribe, papyrus of Ahmes) from about 1800 b.C and 1650 b.C, respectively, and whose contents could be dated to approximately 3000 b.C There is evidence of a table with the decomposition of $2/n$ into unit fractions for odd numbers n from 5 to 101.

In classic Greece some relations between the elements of two sets were also used, the closest thing to the concept of function. What stands out most is the use of proportions of numerical character, with magnitudes of the same type.

Ptolemy introduces the sine function, with a string table, although in reality there is still no idea of a variable or function.

In the Middle Ages, not enough was advanced in the concept of function due to the disproportion between the level of abstraction, which was already had and the lack of adequate mathematical symbolism.

In the fourteenth century the French mathematician and astronomer Nicolas Oresme stands out, for geometrically approaching the study of changing phenomena, by means of rectilinear segments, which reminds us of the graphic representation of a function, but with the lack of the current sense of dependence.

The schools of Oxford and Paris have played a fundamental role in the development of the general notion of function.

In the Modern Age, the formation of the concept of function, is located in the seventeenth century with Galileo, Descartes, Fermat, Newton, Leibnitz.

Due to Newton, among others, the development of functions in infinite series of powers is studied, which makes possible the analytical representation of the vast majority of functions studied then.

Leibnitz in his manuscript of 1673, *Methodus inverse tangentium, seu de functionibus*, uses the term function for the first time.

In the eighteenth century, Jean Bernouilli uses the word function with a meaning closer to the current.

It will be Euler in his work *Introduction in Analysis Infinitorum* (1748) where he makes a detailed study of the concept of function, classifies the different types and we owe him the current notation.

Lagrange in the *Théorie des fonctions analytiques* (1797) systematically developed and applied widely the differential and integral calculus of multivariable functions.

Functions Of Two-Variables: The Teaching Environment

We put special emphasis on the fundamental role played by function of two variables concept in Architecture, Sculpture, ornamentation of some buildings, as well as in the construction of great works, such as bridges.

It is important that the student is aware and knows how to see in the Art, in the great works of Engineering, even more in Nature, the beauty of Mathematics. For this reason we propose to students a brief visual review of some emblematic buildings, constructions, etc. in which the mathematics are fully present. For instance:

Function Of Two Variables: Some Topics In The Didactic Course

Here in the following we present a short summary of program of the courses:

- The concept of Cartesian product is remembered, and as a particular case R^2 .
- The concept of real function of two real variables is introduced.
- Analogous to the functions of a variable, the domain, the maximum domain and the image of a function of several variables are defined.
- The different types of functions are studied, among them: the polynomial functions of several variables, functions of separate variables, ... etc.
- Continuity of functions.
- As a particular case of polynomial functions, quadratic forms are studied in detail, whose incidence is fundamental for the study of optimization.
- Matrix and polynomial expressions of a quadratic form, as well as the relationship between both. The classification by minors and eigenvalues is studied.
- Theorems of continuity.
- Level sets.
- Obtaining the sense of the growth of a function, from the level sets.
- Drawing of the feasible region of an optimization problem with inequality constraints.
- Resolution of optimization problems with inequality restrictions.
- Resolution of linear programming problems.

In the computer classroom, with a specific program, students learn to draw the functions of the variables and their level curves. It is one of the clearest ways to identify absolute maximums and minimums, provided that the appropriate conditions are met (Weierstrass Theorem). They can solve using the graphical method problems with inequality constraints.

Let's see these examples of contour lines:

Given the difficulty of the topic, it seems to us that it is opportune to preliminarily observe the graphic representation of functions with two variables of various types to highlight the problems of regularity that will be treated in a rigorous way in the second half.

We therefore pose the problem of 3D function graphics.

Parametric Surfaces

Most surfaces and curves in Greek geometry are defined through characteristic properties valid only for them, which are generated, with the help of drawing instruments, through *ad hoc* methods.

In order to overcome this restricted method of operating, one needs a radically different point of view, a method that can be applied to curves and surfaces, without being distinctive of any of them, but rather more concerned with the main and general features of the process than with its refinement and precision.

A decisive step was made with the introduction of the Cartesian coordinates by the philosopher and mathematician Descartes (1596-1650). Descartes publishes his great work "La Geometrie" in 1637, where the birth and expansion of Analytical Geometry is established, which will allow the interpretation of curves and surfaces and the idea of dependence between two variables is expressed for the first time. Along with Descartes it is fair to mention Fermat, who formalized the equation of a line (with the notations of Viète).

A point, in the tridimensional space, is characterized by its x, y and z coordinates: if these vary without restrictions, the point describes the entire space, but if instead the coordinates are bound by a mathematical law, the corresponding point generally describes curves or surfaces. Complicated and intricate curves have already been described since the end of the seventeenth century: among them are the *geometrical flowers* by the Italian mathematician Grandi (1671,1742), a real *virtuoso*.

In analytical or Cartesian Geometry curves and surfaces are graphed by plotting points, being thus totally independent from a curve or specific surface, which is defined only by its equation.

This is not a new Geometry, but it is a new language. Cartesian formulation is therefore more powerful and agile than that of classical Geometry.

A further greater flexibility is then obtained from the Cartesian coordinates system with the introduction of parametric equations, that is using the language of Parametric Geometry. The coordinates of the "moving" point on a surface are described as a function of two parameters, which changes linearly. For instance the Cartesian equation $z=f(x,y)$ can become:

$$\begin{cases} x = u \\ y = v \\ z = f(u, v) \end{cases}$$

These equations are more easily computable and therefore lend themselves well to a graphic usage (particularly if computerized).

In conclusion, through the graphic representation, the characteristics of regularity of the functions are therefore highlighted to the students who can, consequently, observe and deepen their study.

Goals Of Proposal

Suppose that the student has understood the basic language with which to describe a function of two variables and that, through this knowledge, is able to use the language of parametric geometry, understanding its potential, to interpret and draw surfaces.

At this point our goal is to put the student in front of the ability to view, apply their knowledge and also have fun, with the use of simple computer tools for graphics.

The experiment carried out in an informatics laboratory is of a graphic type, thus giving back an image, making a synthesis between the use of the parameterization of a surface and the knowledge of the graphs of classical functions of two variables, .

The result is incredible and suggestive images, which the student will judge, not only in terms of mathematical characteristics, but also of beauty.

Activity Description

More precisely we will try and show how a plane figure, which may be generated and expressed through formulas, can develop, either arbitrarily or according to a set aim, into various three-dimensional shapes. A precise mathematical rule, one which is apt to preserve through mutations those characteristics that can be defined, even if not always appropriately, topological of the basic figure, will be required here.

Let us take into consideration a basic geometrical shape, namely a flower shape similar to a *rodonea* by Grandi.

The parametric equations of the curve tracing the contour of the flower are the following:

$$\begin{cases} x = r \sin(8t) \cos t \\ y = r \sin(8t) \sin t \\ z = 0 \end{cases} \quad 0 \leq t < 2\pi \quad (1)$$

where the parameter t is the angle (measured counterclockwise) between horizontal and the line through the center of the flower and the current point of the contour of each petal, and r is the maximum of distance of this point from the center of flower.

**Figure 1**

Let us notice from Fig.1 how the flower has 16 petals; actually the distance of the point of flower contour from the flower center is zero for the angles $t = k \frac{\pi}{8}$ ($k = 0, 1, \dots, 16$).

A flat surface results from filling a proper area inside the contour of the flower; we obtain its equation by introducing a second parameter characterizing, in a variable way, the variability of the distance from the flower center. That is:

$$\begin{cases} x = r v \sin(8t) \cos t \\ y = r v \sin(8t) \sin t \\ z = 0 \end{cases} \quad 0 \leq t < 2\pi, \quad a \leq v \leq 1$$

in Fig. 2 $a = \frac{8}{15}$.

**Figure 2**

The central idea to the process consists now in developing this basic shape according to a fixed mathematical law, although leaving the results a large margin of unpredictability. Obviously the law which links two parameters is a real function of two independent variables

We have thought of a metamorphosis law leading the flat-planed shape within the three-dimensional space, through its projection upon different surfaces. From a mathematical point of view this means that the third coordinate in the parametrization, describing the developing surface, must be properly subjected to variations.

A first example (see Fig.3) shows the projection of the basic figure upon a saddle surface (hyperbolic paraboloid) of parametric equations:

$$\begin{cases} x = v \\ y = u \\ z = v^2 - u^2 \end{cases} \quad v, u \text{ real parameters}$$

Figure 3

on which the basic figure is projected (see fig.4).

Figure 4

Figure 5

The projection (see fig.5) has the following parametric equations:

$$\begin{cases} x = rv \sin(8t) \cos t \\ y = rv \sin(8t) \sin t \\ z = (rv \sin(8t))^2 ((\cos t)^2 - (\sin t)^2) \end{cases} \quad 0 \leq t < 2\pi, \quad a \leq v \leq 1$$

In this first example the chosen surface is very regular as a consequence of the regularity of the function that defines it.

You can then choose less regular surfaces with the presence of discontinuity (or weakening of the derivability) of the function.

For instance in fig. 6 the basis form is projected on the surface of parametric equations:

$$\begin{cases} x = v \\ y = u \\ z = \frac{v^2 u}{v^2 + u^2} + 10 \end{cases} \quad v, u \text{ real parameters (except } v = u = 0)$$

which for $v=u=0$ has a weak discontinuity and partial derivation discontinuous.

The resulting surface equations are:

$$\begin{cases} x = rv \sin(8t) \cos t \\ y = rv \sin(8t) \sin t \\ z = 10 + rv \sin(8t) \sin t (\cos t)^2 \end{cases} \quad 0 \leq t < 2\pi \quad a \leq v \leq 1$$

**Figure 6**

In conducting the proposed laboratory activity, it is therefore evident how the student is stimulated to deepen the study of the characteristics of functions of two variables, finalizing the enhancement of their creativity.

Results

Hence our imagination was let loose ; the projection surfaces have been progressively chosen for their greater geometric complexity and the figures we obtained have taken unbelievable shapes, now light, subtle and elegant, now strong and aggressive ; at times we can recognize them from their basic shapes, at times we can't, since they look absolutely different, but, full of harmony or confused as they may turn out to be, they are nevertheless always in tune with the geometry appearing on the chosen projection surface.

The colors themselves, which have never been modified by graphic programs, fade or become more intense according to the shape alterations, spontaneously contributing to the aesthetical research of the final shape.

One can remark how the symmetry and the regularity of the projection surface are reflected on the symmetry and regularity of the projected shape and how, on the contrary, the discontinuities, the harshness and the asymmetries of the projection shape can alter the original symmetry and regularity.

In the first instance we obtain continuous and smooth shapes (Figs. 7-13), while folds or edges become evident when irregularities arise in the derivatives of the function used. Discontinuities in the function and in its derivatives determine the examples in Figs. 14-18. The surfaces in Figs. 19-27 show examples of “paintings” obtained from the same basis form by the composition of different surfaces with different regularities.

Final Remarks

All figures have been produced with the help of a graphics animation program, simple to use, that is structured in such a way as to allow us to deal with the parametric shapes in the best way. The program has been elaborated by our research group. Any other graphics program that can see the parametric shape of the surface as an input can be used for this purpose.

The results of our work are to be seen in the images here reproduced, which at times have pleasantly surprised even ourselves. Above all they have stimulated us and suggested the way to single out further potentialities of the mathematical and data processing instruments.

Those, who may like to use it, will decide how to deal with this typology of results. If a mathematician, he/she could study geometry on a particular form; if a designer, he/she could devise an object to which the resulting shape may function as a support, or more simply, if he/she feels like it, one could simply enjoy its aesthetic quality.

Mathematics Curriculum for Vocational Schools in Turkey

Sinan AYDIN

Kocaeli University, Kocaeli Vocational School, Turkey
sinanaydin1704@yahoo.com

Abstract

Every pure mathematicians and mathematics educations researchers have an idea about mathematical abilities, and this point haven't regularly argued subject between them. Also, people know that subject is one of the very essential main abilities and performance. Many mathematics educators believe that the center problems of students has not about effectively apply to their scientific background to social areas or in their work. Mathematical activities for laboratory studies of our vocational students and their branch studies has an important aspects for these department students. Moreover, we can see many problems of our students when they are learning and making different area activities at the vocational school in our country. In this paper, we are focusing the analyzing of mathematics curricula of our students. Moreover, we analyses our subject and its environment which is essential for the technical programs in these school. As a result of this study, it is difficult to say that there are a unique basic fundamental math lecture program for technical and social programs of vocational school. Also, every department should organize their special mathematical curriculum needed for them and should focus to mathematics subject in its special curriculum.

Keywords: *vocational school, technical departments, mathematics curriculum*

Introduction

The uncontrollable new conditions coming in our life in everywhere of the world and in this new position everybody should integrated the new life environment, so our students need to have this information from their musters or teachers. Scientific programs at the vocational department help their members to prepare them to new life environment. This new criteria give to students a good advantage of mathematical study area. A good level of student coming with the new position by all scientific abilities performance reactions and moral energy to going on to stay learning according to his/her special interest. So, we believe that the new modulated curriculum give many students a standard of manage their life perfectly (Wenger, 1999).

By the connection of this way, educational activities and vocational school perspective has the good coherent. Our observation tell us that this new environment in vocational culture present a positive atmosphere for their teachers and students (dalby & noyes, 2015). Studies on the finding of vital context of the lecture in the all curricula program give necessity an important way that focusing original situations and teaching methods of organizing math lecture in every curriculum. It is clear that by developing new technologies and their adaptation to education environment modified the position of teacher and students also all methods used to teach and learn to lectures. Operation and basic algorithms has a powerful effect on the organizing and conducting math lectures. In new educational environment student has a good chance to make mathematics quickly and painlessly using technological material in their studies. We are observing in our lectures that they are operating many calculations and many operation not to spend much time. (Ernest at all, 2004).

According to this researcher team, in the effective teaching program, students adapted in to the context of technology. Technology should be modified to the mathematics content in all possible conditions. Such a curriculum takes necessity technology programs and module the learning and doing of mathematics, so students spends much time algebraic skills and conceptual understanding.

Mathematics lectures for vocational schools

Mathematical enviroment develops expressive, helpful and effective at the level they used in submission. In other words, program need to have the learning of mathematics in the answering of difficulties based on real-life applications. All departments in vocational schools in turkey are a complete basis of active backgrounds for the study of mathematics. For example, problem-solving application be done for many departments, as construction technology, computer programs, business, electrics and chemistry (Hyland, 1999).

The advance of math information has a hierarchic procedure. A well-organized and unremitting database has necessity to give the people understanding of the concept deeply. The basics of significant context, definitions, theorems and methods were modulated at the all level of grades. The links between secondary school and high school mathematics and the transition from high school mathematics to university mathematics are very important in the student's conceptual development of skills and abilities (Dalby & Noyes, 2015).

Student's and teacher's position in math lecture

Teacher and students position in the math lecture can be expressed as very responsible role. They have responsibilities to develop an efficient instruction programs and methods to provide their students to well understand the lectures for their lectures and also constructing efficient ways on determination their students understanding position. Also, they need to know their development level of all activities about school program as algorithmic abilities which are important to understand teacher and lecture book presentation. All educational person of vocational school needs to present the same pedagogical and educational perspectives to all students and in all classes for many students' position and also, they present different learning environments and positions for every learner (Ernest at all, 2004). Every teacher need be aware of a main reality that their students want to have a powerful mathematical background to accomplish the difficult concept of mathematics and modulate them into other area of mathematics effectively and painlessly. Another important role of the teacher to help the students to accomplish the understand math which essential and powerful item to applicate basic math concept to other scientific area in their school programs (Dalby and Noyes, 2015).

As mathematician we believe that if a school program modified to mathematics lecture very effectively, students take some responsible roles in their program with their teachers to reach the maximum level good results of the program and high-level accomplishment at mathematics lectures. Also, to reach to best result of well-organized program, the motivated students want to be active in the mathematic lectures which is necessary for the good results and sometimes they try to make some lecture activities themselves. At the end of the well-organized procedure students will be aware of the very important reality of their education life that a very closed relation is essential between showing active performance and to reach to very good position at school achievement. We need to add that some negative results or unexpected situations could be seen at the end of the program application, for example, a few students don't want to be take some responsibilities for the mathematic lectures and maybe they feel that it is difficult to take such responsibilities to accomplish their school program and this is not necessary to do (Dalby and Noyes, 2015). Usually there is a solution for these students that firs teachers need to be learn the reason of the motivation problems than they will give some phycological directions if necessary. So, it could be taken some good results for these students at the and of the education program. Many education systems apply such a solution to give them to reach best result in school life, social life or working life.

Mathematics lectures in the programs

A well-designed lecture program gives positive results for students' departments expectations and their possible working position according to their department. For the all department of the vocational school math curricula, math laboratory studies which students are active in the lectures as computer applications, math processes and/or methods that are modulated mentioned as above, math books or other lecture materials in which all concepts of the lecture are presented according to students' department level are accepted as essential to a balanced approach for the lectures in the vocational school program (Dalby and Noyes, 2015).

In the vocational schools, each of departments' mathematics courses contain a set of modules of the concept which determine, and effect student's department abilities and capacities modulated in these essential processes. It is clear the we need apply the math processes to student learning and our teaching in all areas of a math course and in all lectures of every vocational school departments. A balanced or well-organized math program at the vocational school level includes the development of algebraic skills and application dimensions. The designed curricula prepare students with the algebraic skills they need to understand other aspects of math that they are learning, to solve meaningful problems, to apply their program lectures and to continue to meet with success as they study math in the future (Dalby and Noyes, 2015)

Vital point: math processes

The math processes have straight consistent with each other. Problem solving and collaborating have the strongest value of many disciplines. Problem-solving method inspires students to analyses the focusing to a true way of concept analyses or be aware of the solving. When we make our students to well motivation in math thinking, we also to help them to make math analyzing, applying to formulas to new position, focusing on new different solution types and some approach evaluating with their friends, try to find new relation between the concept and problem situations. In this point to follow problem solving steps have vital important for the student's mental developments during the lecture. All difference approach coming from student need to be supported by the teacher to give them self-confidences. (Robert at all., 2005).

Problem solving

Problem solving is essential to learning math in the teaching and learning. It is considered an essential process through which students can accomplish the opportunities in math and is a main part of the math curricula. It is the main emphasis and area of math in the actual life and assistances students be self-possessed step by step. Also, problem solving tolerates students to practice the information in different areas and aids them link math with conditions related the math subjects (<http://www.edu.gov.on.ca/eng/curriculum>). It is one of the main processes need to learn all math students carefully because of its power to understand mathematics more effectively.

Reasoning

Reasoning in teaching and learning helps students do true connection with math. Laboratory teaching in math lecture can continuously assist serious thoughtful. Another words, it is, a prepared, logical and balanced style to learning math thoughts, theorems and procedures. Moreover, the other name of making mathematics or a necessary tool to operate mathematics concepts, to understand the relation between mathematic concepts and the application

Reflecting

The mean of reflecting math ideas or thinking's is a student frequently and intentionally reproduce his individual understood procedures. Also, we can explain this concept as one of main critical point for student to organize it correctly because of its nature Thus, he can identify at the time method he is consuming is not effective, and give correction to connect to another technique, reanalyzing the problematic situation, look connected information which could solution (<http://www.edu.gov.on.ca/eng/curriculum>). Their problem-solving abilities need to be reinforced at the time student replicate on other behaviors to achieve a problem that students not effectively finish the application. Focusing on the moderateness at a solution thinking the difficult and innovative problem has additional position that students could advance the skill to be aware of problems, also find solution for application studies about real life.

Computational tools

Students want to progress the math abilities at the choice suitable technological apparatuses, software applications, algorithmic approaches to accomplish specific math responsibilities. Another way of the meaning of this concept that doing mathematics with the all equipment, for example, all geometric materials or computer or some concrete box using the lecture Several kinds of tech materials are suitable at classroom and teaching. Students can practice computers and CPUs to large the volume and to check the dimensions studies to examine and analyse math concepts, to have different perspectives on concepts and to reduce the time on purely mechanical activities that is only repeating the same algorithms (<http://www.edu.gov.on.ca/eng/curriculum>).

Communication

This concept is the method of communicating math thoughts. As a social concept, it is important doing efficient mathematics between mathematicians or mathematic students or other students who are using mathematics concepts It is identifications verbally, concretely, choosing numbers, symbols, charts, symbols and all concept of math. Students connect with people from different culture for various purposes. communicating symbols figures is an important method in teaching and learning math. Over communicating, students could imitate and make clarify thoughts, thinking, relations, and math opinions for problems or concepts (Dalby and Noyes, 2015).

Connecting

Problem solving and applications which permit students to find correlations to understand in which way notions are connected to each other's. This support the notion to hold main math concept, definitions and theorems. connecting at the time students to type this type of contacts in their studies, students start to understand math is connect and use together all of the math concepts and ideas and notions and that students could practice their understanding and skills at mathematics from which one concept to another one. Understanding the relations between mathematical steps, definitions, theorems and ideas give students' math thoughtful more powerful.

Result

At the time learners give explanations for the details of being students to vocational school, the central explanations at which coming the the examination had always been *it was always* been very interesting to be classroom and it is very important for me to develop my information and social position. Motivation to lecture discussions providing extra indication which many learners are involved in the vocational courses and appreciated the chance to choose the way of the school or learning.

Abstract

In this study, it remains meant that examining of exact ideas of vocational schools of student, the relation amid school attainment and student' choosing this schools with any program, the sense of mathematic and accounting in the school meaning for vocational school student. This search used an much used and well known study method with a deep analyse searching approach. The review remained lead by three circles of likert-type surveys aimed at the commercial section student after a vocational school in turkey. An entire 203 student remained the defendants of this education. Answers presented that there remained an essential aimed at a exact prospectus aimed at student concentrating happening rudimentary information and services and abridging the gratified of the mathematic custom-made to student. Glitches confronted through normal of the student when knowledge mathematic and accounting remain in retention mathematic gratified, reasons mathematic remains problematic, consuming trouble in sympathetic and smearing mathematic formulations.

Keywords: *vocational schools, mathematic and accounting, difficulty, school achievement*

Introduction

Vocational teaching and exercise production a dominant part in making new student aimed at effort, aimed at emerging passable services and replying toward the work marketplace wants of the cheap the development of the instructive procedure organization remains careful by way of one of the chief habits of well-organized usage of physical, methods and humanoid capitals (Kamariah, A.B., Rohani A.T., Sharifah M.N., Wan Zah Wan A., Ramlah H., Arshad A. And, Abdul Rashid, J., 2010). The greatest real remains the growth of new procedures of group and organization founded in the world. Mathematic and accounting and remain dangerous and energetic to the communal, cheap and, consequently development of contemporary lifetime a republic. The education of mathematic and accounting wants complete preparation to safeguard excellence teaching scheme for the persons (Battal At All., 2017; Bostan, And Durmuş, 2016; Bostan, And Durmuş, 2017; Durmuş, 2016). Though concentrated labors must remain occupied toward teach altogether persons, we must not misplace vision of the attention of the vocational student. Knowledge mathematic and accounting aimed at vocational student remains a marvel aimed at certain viewpoints and does not frequently happen by clearness and ease (Kamariah, A.B., Rohani A.T., Sharifah M.N., Wan Zah Wan A., Ramlah H., Arshad A. And, Abdul Rashid, J., 2010).

The change which beginners remain obligatory toward brand after school which remains theoretic stadium toward the office which remains request part remains a multifaceted and frequently difficult procedure for student. The important inform of the gratified of the vocational teaching, heading for the calibration of prospectuses and instructive packages. The outline of the scheme of instructive praise scheme consumes large compensations, if the school flexibility of the student (Kamariah, A.B., Rohani A.T., Sharifah M.N., Wan Zah Wan A., Ramlah H., Arshad A. And, Abdul Rashid, J., 2010; Zhamuldinow, 2013). Dissimilar issues might principal to knowledge glitches in mathematic for these students. Amongst the issues remain: the exact linguistic, ciphers, problems in dispensation mathematic, certain graphic misperceptions connected to mathematic and accounting knowledge, reminiscence and order problems, and remarkably high nervousness in knowledge mathematic and accounting (Of At All, 2017; Valencia And Black, 2002). Teaching mathematic and accounting aimed at educators and knowledge mathematic and accounting aimed at vocational student remain start toward obtain care and sure teachers must intended knowledge circumstances which remain additional inspiring albeit the procedure of identifying of the glitches remain motionless on an increasing phase. Though, there remain singular wants, and this must remain assumed singular care through mathematic investigators (Kamariah, A.B., Rohani A.T., Sharifah M.N., Wan Zah Wan A., Ramlah H., Arshad A. And, Abdul Rashid, J., 2010; Görentaş And Yıldız, 1999; Bilgin At All, 2010; Yıldız And Görentaş; Bilgin And Görentaş, 2008; Kamariah, A.B. At All, 2010). Investigation educations aimed at vocational school student demonstration a hole amid what remains erudite and what remains obligatory (Baartman And De Bruijn, 2011).

The alliance of student' knowledge involvements attach school and repetition locations remains now of substantial attention inside the instructive school. Educational research educations for vocational school teaching lessons show that certain problems in education plans for knowledge mathematic and accounting remain happening in the schoolrooms (Aydin At All, 2018; Wehlage & Rutter, 1989). The problems remain, for instance, inadequate pledge that student must pertinent previous rudimentary information for knowledge the example and fast degree for presenting numerous of the ideas. Also, absence of rational consistency in the performance of mathematic plans in the schoolroom and deprived message and a absence of collectivity in numerous instructional doings (Kamariah, A.B., Rohani A.T., Sharifah M.N., Wan Zah Wan A., Ramlah H.,

Arshad A. And, Abdul Rashid, J., 2010; Of At All, 2018; Kahraman At All, 2018). Furthermore, inadequate directed repetition of educators toward assistance the student change after the first education phase toward self-governing knowledge and inadequate appraisals toward safeguard that student recall what they must erudite on the talks (Seita, 2004). The goals of this investigation remain toward control and examine;

- *Problems connected to mathematic and accounting learning faced by student*
- *Problems connected to the teaching and learning of math and accounting*

Method

This study working a measurable, evocative review investigation project, connecting commercial section student in a vocational school in turkey. Vocational school student typically refers toward student by upcoming school preparation glitches and difficult school attainment. 203 students after commercial after 1st year and 2nd year class equal was used aimed at this study. The student replied two distinct 5-point likert gauge surveys representative their equal of contract toward stated substances in all survey aimed at knowledge mathematics and accounting (kamariah, a.b. At all., 2010). The statistics remained examined descriptively.

Findings

Founded happening the demographic statistics calm finished the survey, it remained originate that mainstream of the student remained male around 71% and the additional remained female 29%. The fraction of student who consumed approved mathematics and accounting examinations remained not abundant (18.52%). Moreover, albeit the amount of those who approved the examinations remained somewhat little, greatest student supposed that mathematics and accounting talks remained amusing and stimulating toward study. Answers presented that lone around 15.2% of scholar defendants unpopular mathematics (table 1) (Kamariah, A.B., Rohani A.T., Sharifah M.N., Wan Zah Wan A., Ramlah H., Arshad A. And, Abdul Rashid, J., 2010);

Table 1: student perception on mathematics and accounting

Perception	mathematics and accounting	
Category	frequency	percentage
Enjoy	132	65.0%
Moderate	40	19.7%
Dislike	31	15.2%
Total	203	100%

Scholar defendants' insights of their glitches when knowledge mathematics and accounting particularly that the topics remained existence trained theoretic somewhat than computational. For knowledge mathematics and accounting, two glitches remained tinted through mainstream of the defendants, viz., happening their 'difficulty toward recall formulae' erudite (70.0%) and 'trouble to recall mathematics content' (72.1%). As for the other problems related to the learning of mathematics and accounting by way of registered in table 2, albeit certain of the scholar defendants designated that they met the glitches, though lone a lesser amount consumed tinted that they remained consuming those glitches meanwhile mainstream of them did not highpoint the registered glitches by way of glitches they confronted when knowledge mathematics and accounting. The discovery happening stating the student' 'aversion aimed at mathematics and accounting', over lone a minor fraction designated that they aversion mathematics and accounting (16.4%) (Table 2) (Kamariah, A.B., Rohani A.T., Sharifah M.N., Wan Zah Wan A., Ramlah H., Arshad A. And, Abdul Rashid, J., 2010).

Table 2: form two student' perceptions on problems in learning mathematics and accounting

Types of problems	Mathematics and accounting	
	Yes	No
Do not remember the formulae	68.0%	32.0%
Difficult to remember the math content	74.6%	25.4%
Do not understand the formulas	68.3%	31.7%
The concepts are difficult	61.9%	38.1%
Do not know how to apply the formulae	53.5%	46.5%
Do not understand what teachers are teaching	40.4%	59.6%
Teachers change to new topics very fast	20.3%	79.7%
Dislike mathematics and accounting	16.8%	83.2%
Teachers did not give enough examples to answer the questions	11.2%	88.8%

Teachers did not repeat the subject	12.7%	87.3%
Teachers did not explain clearly	12.3%	7.7%
Teachers only asked to do the exercises on the white board	13.6%	86.4%
Teachers make us copy notes	16.3%	83.7%
We were given many problems as homework	12.5%	87.5%

Results

Well-organized application of the ideals of investigation too wants that the investigation public remains eager toward employment the knowledge possible of the limits in instructive schemes toward disapprovingly appraisal the modern investigation procedures and approaches. The consequences connected toward student' insight of their knowledge air demonstrations that usually student remains optimistic method to their knowledge air (Kamariah, A.B., Rohani A.T., Sharifah M.N., Wan Zah Wan A., Ramlah H., Arshad A. And, Abdul Rashid, J., 2010). Though, when only statistics connected toward those who decided toward the bad ideas remained examined it remained originate that meaningfully little aptitude student decided toward the bad ideas likened toward the high aptitude accounting section student.

Abstract

In the curriculum of the Italian secondary school, in the last decade, there has been a renewed interest in the practice of programming, also due to the recent national reforms based on the recommendations of the European Parliament in 2006.

The Maths and Programming project was born with the intention of encouraging the exploration of concepts and properties typical of mathematics through the use of programming. Research literature in mathematics education has shown how the practice of programming helps students develop reasoning, intuition and problem-solving skills. In this perspective, this paper presents the general lines of the project and a didactic activity realized in a first-year Middle school class (age 11-12 years) through the practice of programming using Python programming language.

Introduction

Computer programming is perceived as an important competence for the development of problem-solving skills in addition to logical reasoning. Hence, its integration throughout all educational levels is considered valuable and research studies are carried out to explore the phenomenon in more detail.

High-level thinking and problem-solving skill are requirements of computer programming that most of the students experience problems with. Individual differences such as motivation, attitude towards programming, thinking style of the student, and complexity of the programming language have an influence on students' success at programming (Yağci, 2016). In Italian Middle school, for most students the formal methods of mathematics remain forever mysterious, artificial, poorly motivated, and very obscurely related to intuitive thinking. The teaching of programming languages as a regular part of curriculum study can contribute effectively to reduce formal barriers and to enable students to access an accurate understanding of some key mathematical concepts. In the field of heuristic knowledge for technical problem solving, experience of programming is no less valuable: it lends itself to promote a discussion of relations between formal procedures and the comprehension of intuitive problem-solving and provides examples for the development of heuristic precepts (formulating a plan, subdividing the complexities, etc.). The activity of programming thus fosters an experimental approach toward solving problems; the use of a programming language provides students with a natural framework, a standard vocabulary, and a set of personal experiences for discussing mathematics. This is a great educational benefit – the mathematical thinking of students at all levels is seriously impeded by their inability to verbalise their mathematical experiences (Feurzeig, et al., 2011). Programming is a creative act that does not stop at the intuition of an idea, but expresses a constructive process that is expressed in the algorithm.

The ability to develop algorithmic solutions and to express them in a rigorous manner so as to be able to entrust the execution to a machine - computational thinking - deserves greater attention in the training of future adults as it forms the basis for a conscious use of technology and for profoundly understanding the computational aspects of reality. For these reasons, in Italy, the CINI consortium (Consorzio Interuniversitario Nazionale per l'Informatica - National Inter-university Consortium for Computer Science) has developed a 'Proposal for National Guidelines for the teaching of Computer Science in the School' (<https://www.consorzio-cini.it/index.php/it/component/attachments/download/745>) on the basis of the National Guidelines, highlighting the need to introduce the IT approach to problem-solving from the first school moments.

At the same time, the MIUR (Ministero dell'Istruzione, dell'Università e della Ricerca - Ministry of Education, University and Research) is preparing a syllabus of Digital Civic Education (http://www.generazioniconnesse.it/site/_file/documenti/ECD/ECD-sillabo.pdf) also in light of the National Plan for Digital Education (PNSD - http://www.istruzione.it/scuola_digitale/index.shtml) which introduced computational thinking in schools in order to bring students closer to the basic principles of Computer Science in a playful context (Coding).

The practice of Coding allows for the achievement of two objectives: learning through programming and

developing the habit of solving more or less complex problems. In this perspective, Coding can be included in all the disciplinary teaching activities for each school moment. The policy conducted by the Italian Minister of Education is in line with that of the European Commission which drafted the Digital Education Action Plan (<https://ec.europa.eu/education/sites/education/files/digital-education-action-plan.pdf>), with the goal that by 2020 at least 50% of European schools would take part in Europe Code Week, the campaign for the diffusion of computational thinking (Klopfenstein et al., 2018). As a result, in the last three years the number of Italian teachers who use coding in the classroom has grown through appropriate programming environments.

This paper introduces the essential parts of the Maths and Programming project aimed at the construction of mathematical knowledge through the use of the Python programming language. The main objective is to develop in students the ability to model problems and design algorithms. Specifically, the authors present an educational activity, realised within the project, with students aged 11-12 years. The activity is focused on the construction process of the algorithm for the calculation of the quotient from natural numbers, starting from a real problem.

Theoretical Framework

Today's digital landscape includes a diverse set of software and applications capable of supporting all sorts of mathematical activity. Nonetheless, programming has remained a significant part of science, technology, engineering, and mathematics related disciplines, where professional work often involves not just the use of existing digital tools, but also the creation of new and/or more adequate computer programs. This is just one reason why programming has recently regained the attention of politicians, curriculum developers, and researchers worldwide, who envision it as having potential both within and beyond classrooms (Broley, Caron, & Saint-Aubin, 2018).

In the last thirty years, several studies have been directed to the investigation and analysis of the role and effects of the use of technology in teaching and learning of Mathematics at the cognitive level (Bishop-Clark, 1995; Costabile, & Serpe, 2012; Goos, et al., 2003; Lesmeister, 1996; Quesada, & Maxwell, 1994; Lye, & Koh, 2014; Weber, 1998). In particular, the value of the programming in educational and pedagogical terms has been recognised internationally (Aydin, 2005; Costabile, & Serpe, 2013; Dubinski, & Tall, 1991; Kuzler, 2000; Liao, & Bright, 1991; Oprea, 1988; Pea, & Kusland, 1984). Programming is more than just coding, for, it exposes students to computational thinking which involves problem-solving, as well as using computer science concepts like abstraction and decomposition.

Wiedenbeck & Ramalingam (1999) defined programming as a process which includes a variety of cognitive activities, and mental representations related to program design, program understanding, modifying and debugging. In addition, Bayman & Mayer (1988) specified that programming involves syntactic, conceptual and strategic knowledge. The syntactic knowledge includes the programming languages' specific facts and rules; conceptual knowledge concerns programming structures and principles; and strategic knowledge is related to applying general problem-solving skills (Çakiroğlu, 2013).

The importance of programming since the early years of schooling has also been stressed (Clements, & Gullo, 1984; Clements, 1990; Clements, & Meredith, 1993; Fessakim, et al., 2013). Furthermore, the curriculum of mathematics has given an increasing emphasis on problem solving processes, indicating didactic problems of an intentional and functional nature as the educational goals to be achieved, in terms of knowledge, skills and abilities (National Council of Teachers of Mathematics, 2000). However, in recent years, there has been renewed interest in introducing programming into teaching because it is a cognitive and constructive activity.

Hatfield (1984) had already highlighted the pedagogical value of programming by detecting the existence of strong links between the thought processes that are triggered in students when they design and/or write computer programs and aspects related to mathematical thinking. Even Papert (1980) emphasised the fact that the construction of a program is configured as the construction of knowledge and, above all, warned about the use of 'pre-packaged' programs that inhibit creativity and a sense of discovery in the learner. Similarly, Bork (1981) associates 'computer programming as a vehicle for ... training ... analytic thinking applicable to broad classes of problems' and Nickerson (1982) states that we can see 'computer programming as a vehicle for teaching thinking skills'. Students only learn when they get the chance to construct their own knowledge and re-elaborate previous knowledge. In Mathematics education, computer programming allows the learner to develop new ideas and become familiar with them, and handle mathematical objects in an informed way as a result. The use of a programming environment in the classroom promotes a shift from concrete to abstract learning, and from the iconic to the symbolic (Kelly, 1984) so strengthening rational thinking.

Computer programming has been described by Nickerson (1982) as a creative endeavour that requires planning, accuracy in language use, generation and testing of hypotheses, and ability to identify action sequences. It ought to represent a fundamental part of the literacy for twenty-first century citizens (Rushkoff, 2010) as it is now a skill required for most jobs and spare time activities. While this is certainly true, one should not forget the psychological perspectives of computing in Mathematics (Hatfield, 1984).

The basic principle underlying the practice of programming in the classroom is that students can use the computer as a Mathematics laboratory in which to experiment (Howe, et al., 1989). Devising a program creates the

opportunity for experimenting by operating a cognitive shift in focus from procedures to their effects.

This kind of learning experience develops problem-solving skills. Feurzeig, et al. (1969) - the first to propose the practice of programming in the teaching of Mathematics in the classroom - believed that a programming language would provide an excellent environment for students to explore Maths and provide an ideal context for the understanding of problem-solving steps.

Programming gives the opportunity to organize, produce, understand and establish processes and procedures in order to plan, design and build computer prototypes of objects; translated in terms of student skills this means the learners can acquire intellectual education in all its components (logical, intuitive, creative and imaginative) and capacity for abstraction and modelling to solve real-world problems. Problem-solving is one of the skills employed in the learning of a programming language (Gundarao, Manjunath, & Nachappa, 2010). One needs to develop good problem-solving skills in order to learn how to write a successful computer program (Gundarao, Manjunath, & Nachappa, 2010). Gomes and Mendes (2007) also state that it is necessary for learners to develop good problem-solving skills in order to learn to program.

Maths And Programming Project

The use of programming in school favours the development of high levels of mathematical thinking in relation to numerical aspects related to reasoning, abstraction and problem-solving skills (Clement, 2000). More recently, attention has been paid to defining computational thinking (Wing, 2008), which is seen as part of a family of different aspects of mathematics thinking (Wing, 2008).

Maths and Programming is a one-year research project involving a class of 29 students, aged between 11 and 12 from a secondary-middle school in Calabria (Italy). Divided over a time frame of 40 hours, the project was initially linked to computational thinking to then give ample space to some key concepts of Mathematics emphasised through the programming activity. Specifically, in the first part of the project the students acquired the basics of programming and the general syntax of the Python language; in the second part, on the other hand, they refined the conceptualisation of what had been learned through the structuring of specific algorithms for the resolution of real problems related to basic arithmetic.

The project aims to facilitate the understanding of the concrete-abstract relationship, in order to avoid the acquisition of purely theoretical mathematical concepts in arithmetic with the use of programming.

The procedures of the project were framed around four phases.

- Administration of a pre-test to the students, aimed at exploring the students' knowledge in relation to some arithmetic concepts and students' ability in problem solving. The learning activities are planned based on the results of the pre-test.
- Introduction to basis of programming languages Python.
- Creation of didactic activities, further divided into various dates, supported by the use of Python programming languages.
- Administration of the post-test to the students, which consisted of questions concerning the resolutions of some real arithmetic problems.

The didactic activities were designed for the project based on the learning model in Figure 1 (Frassia, 2018).

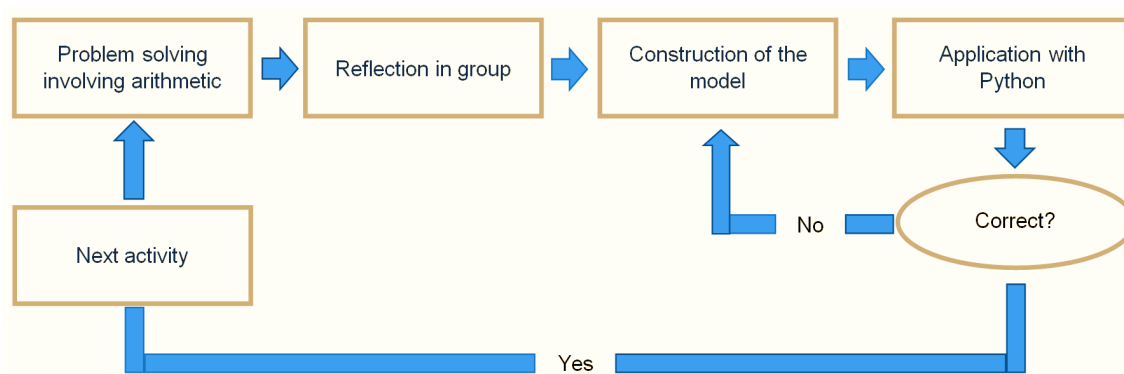

Figure 1: Learning model.

The phases of the teaching activity are explained below in more detail:

Problem-solving involving arithmetic: The learning activity starts by posing a problem in the context of daily life so as to make it meaningful to the students.

Reflection group: A careful reading of the text is followed by a discussion guided by the teacher on questions about the problem. A whole class discussion managed by the teacher includes interaction and communication with the students. As well as being an active, positive and collaborative exchange, this phase is essential for the continuation of the activity and allows all students to reflect on their own ideas.

Construction of the model: The construction of the model requires the students to reproduce some aspects of reality in order to analyse and study them. In this context, the algorithm represents the model. Moving from the experience to the construction of the meaning requires the construction of a simple algorithm to solve the situation proposed.

Application with Python programming language: The model is made explicit and reviewed in a logical sequence thanks to the algorithm; furthermore, the use of a programming environment, like Python, adds value because it helps the students to reinforce their skills in handling mathematical language. The construction of the algorithm is an important and delicate phase because the students have to design the 'finite sequence of steps' that allows the computer to get to the solution or to highlight the need for further study. Moreover, programming is a constructive and cognitive activity as it allows the student to acquire skills, strategies and techniques to solve problems using the concepts of variable, procedure, repetition and recursion, which are transversal concepts linked to other school subjects (Frassia, 2014; Serpe, & Frassia, 2017). The pedagogical-educational value of programming is internationally recognized (Pea, & Kurland, 1984); especially in the Informatics Education Report - ACM Europe (<http://europe.acm.org/iereport/>) the strategic role of this practice that today forms the basis of scientific progress is emphasized. Consequently, the programming cannot and must not be neglected in the teaching and learning of mathematics because it helps to form and enrich the technical, scientific and cultural development of young people. The practice of programming, then, becomes a useful mental training exercise, allowing at the same time the effective resolution of problems or simulation of reality. The teaching practice takes advantage of this game-like activity intended as a "space of knowledge" that allows students to formulate precise questions, record their thoughts, and, therefore, leads them to the formulation of a common synthesis (Frassia, 2015). Aspects of reality, then, are reconfigured to be analyzed and studied through the computer, as a program tool.

The results of pre-test highlight the following students' difficulties:

- in reading and understanding problem;
- they do not recognize data;
- they are not able to reorganizing strategy and solving problem;
- they are not able to confirm of the answer and process.

But, they don't have any difficulty in the operation's (addition, subtraction, multiplication and division) mechanism, that is, the students are able to correctly execute the algorithms of the four fundamental operations. Based on the results of the pre-test and following the learning model, five learning activities were designed (Table 1).

Didactic activity	Learning topics
One	Problem-solving involving addition.
Two	Problem-solving involving subtraction.
Three	Problem-solving involving multiplication.
Four	Problem-solving involving division.
Five	Problem-solving involving four basic operation.

Table 1: Learning topics.

This paper will now concentrate only on the fourth activity.

A Didactic Activity Of Maths And Programming Project

In this section, we report on the fourth learning activity about problem-solving involving division.

Initially, the teacher proposed to the students the following problem situation:

A group of three friends, always attentive to social issues, decided to collect the clothes they no longer wear and to give them to the voluntary associations in their city. None of them knows how many disused items of clothing he/she owns, but it is their intention to distribute them equally among the associations.

In relation to the clothes collected and the number of voluntary associations present in their city, how many items of clothing will each volunteer association receive?

In which case (s) will each voluntary association receive no garment?

In which case (s) will it not be possible for the three friends to realise their purpose?

The teacher engaged in a discussion on the data in the context of the introduced problem. This conversation triggered and guided by the teacher is very important because it avoids the construction of formal games, and educates to a reasoned exposition of conjectures and hypotheses, stimulating creativity, intuition and imagination. The students divided into 6 groups (5 groups of five and 1 group of four) by the teacher reflect about the text of the problem and begin to formulate some hypotheses. Some of the recorded comments between the teacher (T) and students (S1, S2, S3, S4, S5) in group 1 are reported below:

S1: We must divide the number of garments collected by the number of voluntary associations.

S2: But we do not know this.

- T: How can we continue without these data?
- S2: Do we invent them?
- S3: We must make hypotheses and then generalise.
- S2: For example, if the three friends collect 20 garments and there are 2 voluntary associations, they will be able to distribute 10 garments to each association.
- T: And if there were 16 items of clothing and 3 voluntary associations, how would the clothes be divided?
- S1: (With the calculator) 16 divided by 3 equals 5.33333
- T: Can we accept this solution?
- S3: We cannot accept it, because we cannot have a decimal number of garments.
- T: So what?
- S3: Each association will receive 5 garments and the three friends will have one left over.
- T: If the number of garments was 6 and that of associations 11?
- S1: It cannot be done because the first number (the dividend) is smaller than the second (the divisor).
- T: Do you all agree? Think about the case where 3 slices of cake are left and there are five of you, if you decide to eat them only if there is an equal number of slices per head, how many slices of cake will you eat and how many will remain?
- S5: We will not eat any and all 3 will be left over.
- S3: Then each association will have zero garments and 6 will remain.
- T: Let's consider another case: if the number of garments is 7 or any other positive natural number and the number of associations is zero, what happens?
- S2: That makes 7 or the number of garments.
- T: 7 is the result of which operation? Explain this better.
- S2: 7 divided by 0.
- T: If there are no voluntary associations, can the collected garments be divided?
- S4: No.
- T: So, what can we conclude about the division of a positive natural number by zero?
- S3: That division by zero is not possible.

At this point, the teacher proposes to schematise some of the predictable cases so as to give an answer to the initial problem and then put in a table. The following is an example (Table 2).

N. of garments	N. of associations	N. of garments per association
4	2	2
11	3	3
27	4	6
0	5	0
13	0	Not possible

Table 2: Scheme.

At the end of this point, the teacher asks each group of students to write the algorithm that allows them to answer the question when the values related to the number of garments and the number of voluntary associations changes. The ability to think in algorithms and procedures is promoted as an important learning goal in mathematics. Algorithmic thinking describes students' ability to work with algorithms understood as systematic descriptions of problem-solving and construction strategies, cause-effect relationships, and events (Misfeldt, & Ejasing-Duun, 2015).

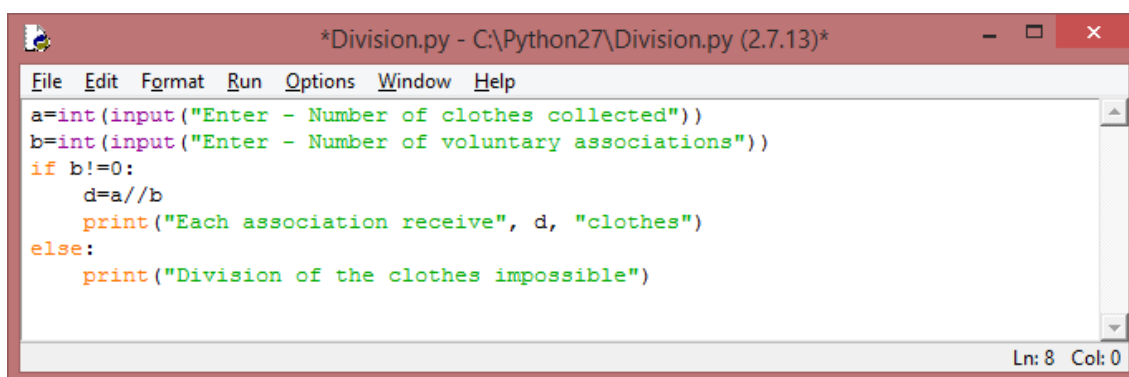

The steps of the algorithm related to the situation proposed are:

```

Input: a (Number of clothes collected)
      b (Number of voluntary associations)
Control:  if (b ≠ 0)
           Calculate:  $d = a/b$  (whole division)
           Print: Each association will receive  $d$  clothes.
        else:
           print: Division of the clothes impossible.

```

The implementation of the algorithm in Python programming language is as follows:

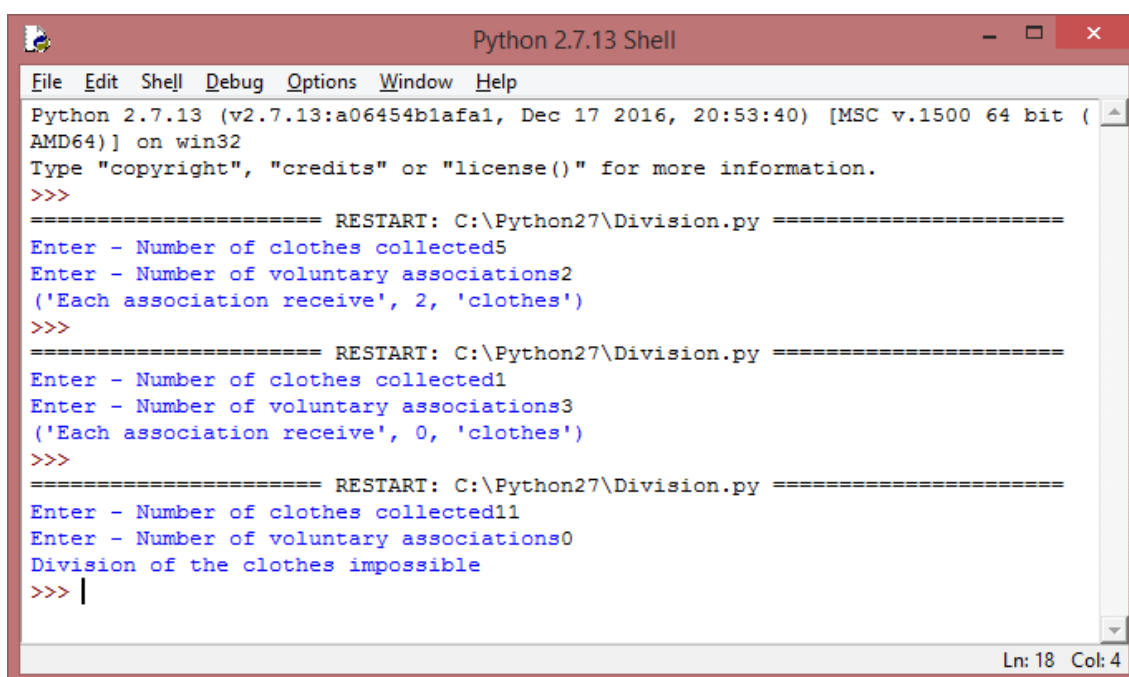

```

File Edit Format Run Options Window Help
a=int(input("Enter - Number of clothes collected"))
b=int(input("Enter - Number of voluntary associations"))
if b!=0:
    d=a//b
    print("Each association receive", d, "clothes")
else:
    print("Division of the clothes impossible")
Ln: 8 Col: 0

```

Figure 2: Code-Program to calculate the solution of the problem.

When the students run the program, they should see the following:

```

Python 2.7.13 Shell
File Edit Shell Debug Options Window Help

Figure 3: Output – Program to calculate the solution of the problem.

In the end, the students generalise the solutions to the problem:

- If $a < b$ each association received zero garments;
- If $b = 0$ it is not possible to divide the number of garments because there are no voluntary associations in the city;
- If $a > 0, b > 0, a > b$ each association will receive at least one item of clothing.

Conclusions

This study investigated qualitatively the effect of the process of learning to program on students' problem-solving skills.

The results of the study showed that in mathematics learning to program did have a significant effect on students' problem-solving skills.

After the didactic activities, the post-test was administrated. The result of the post-test are listed below:

- They are able to identification the data and the questions;
- They are able to make decision in the resolution of problem solving;
- They are able to make the operation (addition, subtraction, multiplication and division) between integer number in the correct context.

In Table 3, the authors report the initial and final observations made by the students:

Initial observation	Final observation
They believe that division between two natural numbers returns a single "number" - the quotient - and that this can be decimal.	They have become aware of the fact that division between natural numbers returns two integers: the quotient and the remainder.
They cannot contextualise the result of the division in a real situation.	They are able to contextualise the results obtained by the division in the real situation.
They believe that in the division the dividend must be greater than the divisor.	They have become aware that in the division the dividend may be smaller than the divisor.
They believe that a number (n) divided by zero (0) is equal to the number (n).	They have become aware of the fact that the division between a positive natural number and zero is not possible.
Few of them can identify the situation in which division can be applied.	Almost everyone can identify the situations in which the division is to be applied.

Table 3: Initial and final observation of fourth activity.

Ultimately, this type of activity provides students with additional conceptual tools to understand the logic and processes that underlie the resolution of real problems. The abstraction, organisation and precision efforts, characteristic of a mathematical activity assisted by programming, contribute to the development of critical thinking and allow students to create and acquire new skills, also ones that are transversal to other disciplines.

Abstract

The growing impact of globalisation and the development of a 'knowledge society' have led many to argue that 21st century skills are essential for life in twenty-first century society and that to utilise technology is central to the development of these skills. Teachers need to be aware of what implications this has for teaching and learning strategies, as well as for the construct of their lesson presentation. A new approach to teaching practice, calibrated for the 21st century, requires teachers to use digital artefacts as an integral part of their teaching.

This paper describes an example of practice in the in-service teacher training programme for maths teachers of secondary school, within the Plan for Digital Education (*Piano Nazionale Scuola Digitale* - PNSD).

The authors' aim is to make participating teachers reflect on their own teaching praxis when using digital technology as an integrated part of their pedagogical content and at the same time to develop their own programmes for digital technology literacy to meet the teaching demands of the 21st century.

Introduction

"The Digital Agenda for Europe is one of the seven flagship initiatives of the Europe 2020 Strategy, set out to define the key enabling role that the use of Information and Communication Technologies (ICT) will have to play if Europe wants to succeed in its ambitions for 2020" (Digital Agenda for Europe, <http://ec.europa.eu/digital-agenda/>). For this reason, the Italian Government has adopted a series of reforms - in the labour market, in the education and innovation systems - aligned with international documents such as the Recommendations of the European Parliament and Council of Europe (<http://ec.europa.eu/citizenship/>), Framework for 21st Century Skills (<http://www.oecd.org/education/ceri/>). The National Plan for Digital Education (*Piano Nazionale Scuola Digitale* - PNSD- <http://www.miur.gov.it/scuola-digitale>) is part of the broader programme initiated by the recent law reforming the education system, "La Buona Scuola" (Law 107/July 2015- <https://labuonascuola.gov.it/>), and is based on the following assumption: technologies should serve active learning for students and innovative practices for teachers, not vice versa.

The final goal is to give teachers and students a competitive advantage, such as classrooms and schools 'boosted' by the internet and technological devices. The plan is the steering document from the Ministry of Education, Universities and Research (Ministero dell'Istruzione, Università e Ricerca - MIUR) to launch a comprehensive strategy for promoting innovation in Italian schools; the purpose is to reposition the education system in the digital era. The plan consists of 35 actions which will be implemented up to 2020 and is in line with the Italian Digital Agenda strategy. Specifically, Action # 25 - In-service training for educational and organisational innovation - (http://www.istruzione.it/scuola_digitale/allegati/Applicativi/SmartGuide_PNSD_DM762_Docenti2016.pdf) is aimed at re-elaborating and adapting professional skills of teachers, not only on a purely instrumental level, but above all on a critical level in order that these teachers rethink their didactic activity in its entirety.

In this institutional framework, the Regional School Office (USR) of Calabria has launched the "PNSD on the Road" initiative dedicated to the promotion of training activities for all local schools, with particular attention to teachers who play the role of both digital animator and as 'part of a digital innovation team' (http://www.istruzione.calabria.it/wp-content/uploads/2016/03/PNSD-on-the-road_per-i-docent.pdf).

This required an open call - from the USR Calabria (regional MIUR) to experienced university researchers in order to follow up on targeted interventions aimed at designing good practices in the classroom with mathematical technologies, also with a view to enhance existing initiatives.

This paper describes an example of practice in the in-service teacher training programme for maths teachers of secondary schools in the province of Cosenza. The training action put in place by the authors, within the 'PNSD on the Road' was aimed at acquiring the knowledge of instructional strategies and representation to enhance the processes of mathematical modelling in the classroom with the use of technological tools intended as tools in service to teaching in a specific pedagogical framework. The paper is structured as follows: this introduction is followed by the theoretical framework and the design and development of one of the teaching practices developed within the training programme. The article finishes with some concluding remarks.

Theoretical Framework

In today's world it is important for students to develop lifelong learning skills, often referred to as a capacity of "learning to learn" (Anderson, 2008, p.19); many countries have implemented initiatives in education, in mathematics in particular, to respond to the challenges in acquiring these new skills - for the 21st century – which are creativity and innovation, communication and collaboration, research and information fluency, critical thinking, problem-solving and decision making, and digital citizenship and technology operations.

The skills cannot be taught in isolation, Voogt et al. (2013) argue that, "most frameworks recognise the complex and cross-disciplinary nature of 21st century competencies and thus recommend integrating them across the curriculum" (p. 407). In preparing for these skills, the appropriate use of technology by maths teachers in education is crucial. Roberts, Leung, and Lin (2013) comment on the complexity of the interplay between technology, mathematics, and education, noting that this complexity related to the use of tools in mathematics is not a phenomenon that is due to current technologies, but one that has been evident whenever people use tools in mathematics. The rapid development of digital technologies features new capabilities not even considered possible in the past. Today, different types of technology are available for teaching mathematics, and different technologies are appropriate for different purpose (Drijvers, et al., 2016). For example, technologies for communication, documentation, and presentation are essential in order to support the exchange of mathematical ideas. Mathematical technologies, such as spreadsheets, Computer Algebra Systems (CAS), Dynamic Geometry Software (DGS), and applet, enable teachers and students to investigate mathematical objects and connections using different mathematical representations, and to solve mathematical problems (Zbiek, et al., 2007).

In a balanced mathematics program, the strategic use of technology strengthens mathematics teaching and learning (Dick, & Hollebrands, 2011). Simply having access to technology is not sufficient. The teacher and the curriculum play critical roles in mediating the use of technological tools (Roschelle, et al., 2009); this implies a revision of pedagogical landscape in terms of the ways in which students engage in learning, and how understandings emerge. Programs in teacher education and professional development must continually update practitioners' knowledge of technology and its application to support learning. Waits and Demana (2000) argue that adoption of technology by teachers requires professional development that focuses on both conceptual and pedagogical issues, ongoing support in terms of "intensive start-up assistance and regular follow-up activities" and a desire to change from within the profession.

In Italia, the Ministry of Education, Universities and Research, for some time now, has adopted strategies to increase teachers' awareness in this direction by means of appropriate training courses that do not stop at the theoretical level, but are supported by tools to support practice and examples: there is nothing better than a good example to understand mechanisms and generate, by analogy, new ideas both in terms of teaching strategies and in relation to the effective use of teaching technologies.

Opening diverse ways for learners to construct and comprehend mathematical knowledge and to solve problems, calibrated for the 21st century, requires a new approach to teaching practice and calls for the reflections of the teachers on their own teaching praxis when using digital technology as an integrated part of their pedagogical content knowledge. Content-based activities using technology should address worthwhile mathematics concepts, procedures, and strategies, and should reflect the nature and spirit of mathematics. Activities should support sound mathematical curricular goals and should not be developed merely because technology makes them possible. Indeed, the use of technology in mathematics teaching should support and facilitate conceptual development, exploration, reasoning and problem-solving (Wilson, 2000). For example, the modelling activities do not compromise mathematical content and pedagogy because they help develop problem-solving skills and promote connections between the real world and the mathematical world (Stillman, et al., 2015).

Several research studies recognise that the development of technology creates more opportunities for practicing mathematical modelling in the classroom (Galbraith, et al., 2007); this has led to the promotion of modelling activities in schools (Lester, & Kehle, 2003; Stillman, et al., 2013).

In recent years, the practice of modelling with the use of technology has been fully included in the Mathematics school curricula (CAS, DGS, spreadsheets, programming environments, etc). Siller and Greefrath (2010) have implemented Blum and Leiss' (2007), modelling cycle introducing the world of technology (Figure 1).

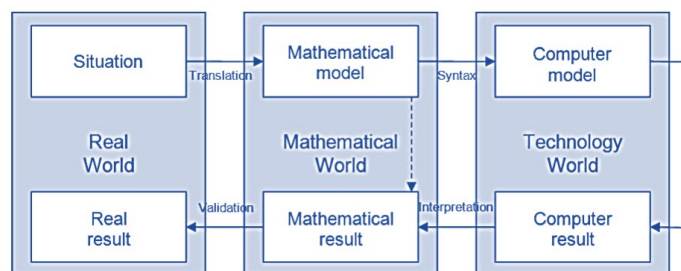

Figure 1: Extended modelling cycle – regarding technology when modelling.

The three worlds shown in Figure 1 are idealised and influence each other. For example, the development of a mathematical model depends on mathematical knowledge on the one hand, and on the other hand is influenced by the technology. The use of technology increases the chance to solve some mathematical models; in particular, the intelligent use of computers in teaching allows us to increase motivation on the one hand and to recognise the importance of mathematics in life on the other (Frassia, & Serpe, 2017). Unfortunately, many teachers prefer not to introduce modelling in classroom practice for different reasons, which include the lengthier learning process; at the same time, there are many reasons in favour of integration between modelling and technology (Siller, & Greefrath, 2010). In classroom teaching practice, the use of technology allows you to create new opportunities in the processes of teaching-learning and at the same time operate active links between the ideas and the mathematical content (Frassia, 2016). The use of technology can help to simplify the difficulties typical of some modelling procedures. Siller and Greenfrath (2010) identify some key elements when you engage in modelling activities with technology: computationally-intensive or deterministic activities; working or evaluating structuring of large data sets; visualising processes and results; experimental working.

Given this scenario, the authors illustrate an example of teaching practice for the 21st century relates to the content 'Elementary functions: basic tool for modelling'. The example emphasizes content and pedagogy, and not just software; in fact, the purpose of the authors is to prevent technology use from compromising mathematics and to encourage users to connect their experiential findings to more formal aspects of mathematics. In other words, technology should not influence students to take things at face value or to become what Schoenfeld (1985) referred to as "naïve empiricists."

An Example Of Teaching Practice

The math in-service teacher training, in the 'PNSD on the road', involved 50 secondary school teachers in a 12 hour course. According to Azione#25, the design of the teacher training programme has seen the development of mathematics teaching practices in such a way as to optimise the potential of technology to enhance students' understanding, stimulate their interest, and increase their proficiency in mathematics.

The choice of mathematical technology has fallen on the DGS GeoGebra because it is a software that teachers know very well from a technical point of view, but above all because it puts together the idea of a usability heuristic with a socio-constructivist learning perspective. The goal of the trainers is to point out that having a repertoire of heuristics does not automatically solve the central problem of "which" to use and "how", once you are faced with a specific problem. The teacher should not focus exclusively on the knowledge possessed (both in terms of basic mathematical knowledge and heuristic repertoire), but on "how" they must be used in order to provide the student with the opportunity to make meaningful and stimulating experiences and that are not limited to the execution of repetitive tasks. For example, the use in class of a DGS like GeoGebra widens the possibilities thanks to the following aspects of pedagogical usability:

- Encouraging student collaboration;
- Sequencing and sharing student work on mathematical task;
- Orchestrating mathematical discourse;
- Monitoring and assessing students' mathematical learning

should be considered along-side the technical aspects.

Based on these premises and in accordance with international research studies (Goos, et al., 2007, Doerr, & Pratt, 2008; Arzarello, et al., 2011), the maths in-service teacher has been oriented to the development of teaching practices related to elementary modelling in the classroom – with the use of GeoGebra – in such a way as to provide links from school-based learning to interdisciplinary themes that are essential to every student's ability to thrive as a global citizen. Students are able to discover ways to solve old problems and develop new ways of thinking about the world around them – a skill that is essential for the 21st century.

Mathematical modelling as an iterative problem-solving process that includes posing authentic, open-ended problems, making assumptions, identifying constraints and variables, building mathematical solutions and, finally, analysing and interpreting these solutions. It is iterative because once the initial solution is tested and translated back to the real world, revisions usually need to be made and the process continued until a satisfactory solution is reached and can be justified (Suh, et al., 2017).

In this perspective, the training action has privileged laboratory teaching in order to re-configure the knowledge to be taught in order to make it an object of investigation for the students and to favour the construction of mathematical ideas and meanings. In fact, the intention of the trainers is to bring the laboratory practice back to the centre as an essential meeting point between 'knowledge and know-how' also in the light of PNSD Action # 7, which designates the laboratory as a place of innovation and creativity where technology must combine tradition and the future, recovering practices and innovating them. Ultimately, a teacher training that sees the planning of laboratory activities, on the elementary mathematical modelling, as a means to improve the application of both the technical and pedagogical usability of the technology.

The teachers, provided with their own device (PNSD Action # 6 - Bring Your Own Device –BYOD), after having chosen the mathematical content must plan a real situation (Real-life problem) and develop it through the

modelling cycle (Fig.1) describing the different sub-processes of modelling with different levels of detail and emphasis. The implementation of this model encourages inductive reasoning while leaving plenty of opportunity for discovery. The simulation with GeoGebra software allows you to take stock of the situation and start again from what you know, to make appropriate considerations and understand why phenomena occur, and their implications. Specifically, the simulation represents a constructive and cognitive activity because it enables you to acquire skills, strategies and techniques for the solution of problems.

Now the authors describe an example of teacher practice on mathematical modelling of linear functions realised during in-service teacher training. In detail, the phases of the teacher training can be summarised as follows:

- 1) Theory-oriented competency (necessary knowledge about theoretical aspects of modelling such as knowledge about modelling cycles, goals and perspectives for modelling, types of modelling tasks).
- 2) Teaching competency (ability to formulate a real-life problem, micro- and macro-scaffolding abilities such as the ability to plan and perform modelling lessons and knowledge of appropriate adaptive interventions to enable students to work as independently as possible) and task-related competency (ability to solve a modelling problem, to analyse possible obstacles and necessary competencies, and to create modelling tasks on their own).
- 3) Diagnostic competency (the ability to identify phases in students' modelling processes and to diagnose students' difficulties during such processes in order to support students during their work and to select modelling problems).

In the first phase the teachers study, with the support of trainers, part of the existing literature on mathematical modelling also with the use of technology, focusing on the modelling cycle of Siller and Greefrath (Fig.1). Another fundamental theoretical pillar of analysis is the question concerning the formulation of a good real-life problem; in this sense, the principles proposed by Wedelin and Adawi (2015) for the design of problems related to real life have been a starting point, also providing ample space for discussion between teachers and trainers.

In the second phase the teachers are actively involved: divided into groups they must design problems related to real life, considering and hypothesising the sequence of actions to be recreated in the classroom and analysing the difficulties and skills required of the students. In this phase, the formulation of the text is fundamental as it must satisfy the principles of Wedelin and Adawi (2015). Below is the text of one of the problems created by a group of teachers, based on an experience in the classroom.

Problem of gym fees:

Anna and Maria received a scholarship of € 150.00 for their excellent academic performance. They decide, by mutual agreement, to allocate part of the amount for registration in the gym and the remaining part as a donation to a charity for the protection of the environment.

Anna and Maria do not live in the same neighbourhood, so they decide to enrol in two different gyms. Anna enrolls in a gym that requires the payment of a registration fee of € 30.00 and a weekly fee of € 10.00; instead the gym to which Maria enrolls requires a registration fee of € 20.00 and a weekly fee of € 12.00.

If Anna and Maria want to allocate the same amount to the charity, how many weeks can they attend the gym?

This example can be discussed under the aspect of different didactical principles:

- Graphical discussions (to draw a chart or diagram of the given situation, and/or modify a given chart with paper and pencil or DGS).
- Symbolic discussion (to describe the situation for both gym fees with the help of a function or functional dependency with paper and pencil or CAS).
- Numerical discussion (to compute data to solve problem with a scientific calculator or spreadsheet).

The various groups of teachers discussing the various methods and having at their disposal each their own device (BYOD) tend to favour the method that they usually use in the classroom also using the technology most familiar to them. Trainers point out to teachers that it is not important which method is chosen because in the classroom, when students are faced with a problem they tend to work on the basis of their experience and use methods familiar to them so that they can fulfil the task. Instead, it is important for student to see the different approaches for this problem.

This problem can be solved in completely different ways. It helps to uses the DGS because this provides the double possibility of translating the problem into the two registers (algebraic and geometric); in addition, by assigning variables - using sliders - the generalisation of the problem and its solution is obtained.

Looking to the modelling cycle by Siller and Greefrath (Figure 1), teachers must try to translate the steps which are necessary for solving the problem.

The hypotheses of the extended modelling cycle for the "Problem of gym fees" problem elaborated by the teachers are presented in Figure 2.

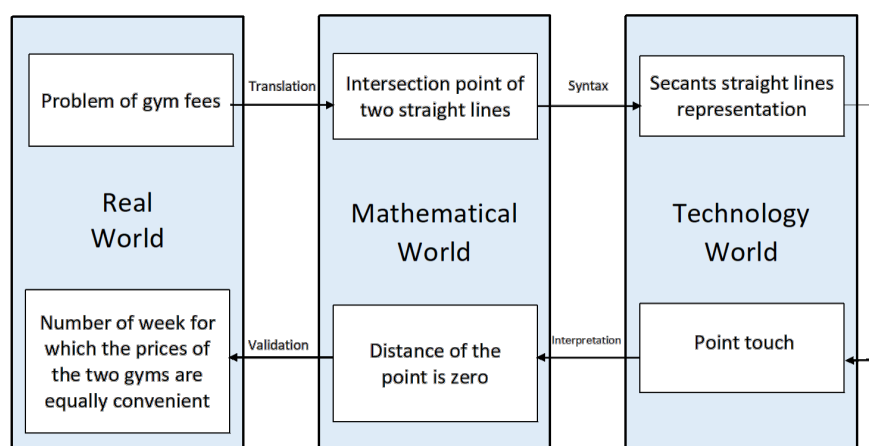

Figure 2: Extended modelling cycle for the “problem of gym fees”.

At this point the teachers retrace the model in Figure 2 step-by-step:

- Reading of the text and discussion aimed at identifying the data of the problem.
- Translation of the "Problem of gym fees" into mathematical language (determine the intersection point between two straight lines). This step requires the modelling process that determines the two payment fees (linear functions), offered by the two gyms:

$$y = 30 + 10x$$

$$y = 20 + 12x$$
- The syntax process allows a geometric representation in the Cartesian plane through modelling with the GeoGebra software (Figure 3).
- Solution of the problem in the world of technology (identification of the intersection point between the two straight lines represented in the previous step).
- Mathematical interpretation of the result obtained with GeoGebra (distance between two points belonging to the two straight lines).
- Validation of the mathematical solution in the real world.

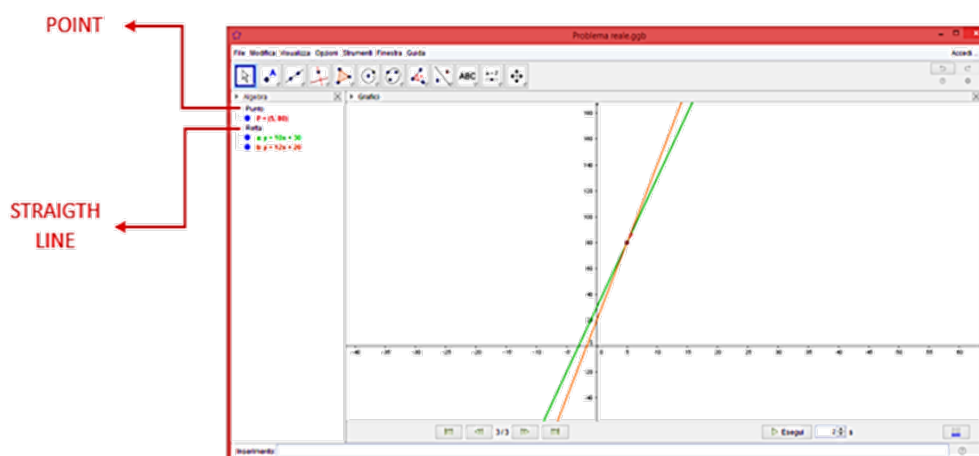

Figure 3. Output of the resolution of the “Problem of gym fees”.

In the third and final phase, teachers discuss the skills that students can develop in a process of mathematical modelling with the use of technology.

Specifically, with reference to Figure 4, the following skills are found:

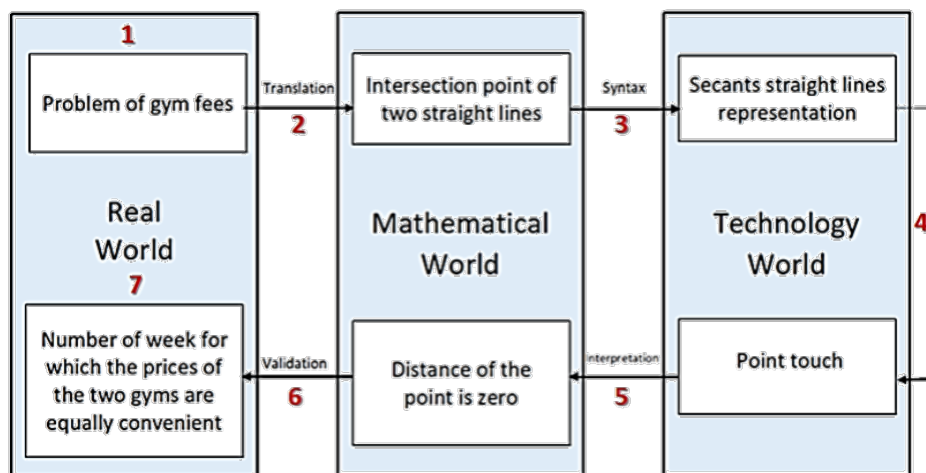

Figure 4: The extended modelling cycle for the “problem of gym fees”.

1. in understanding, analysing and structuring the real problem;
2. in the creation of a mathematical model through the language of the real world and in the use of mathematical content for the resolution of problems;
3. in the manipulation of variables of the mathematical model;
4. in the use of the IT tool;
5. in the interpretation of the results in the mathematical model;
6. on the reflection and validation of the model and in the interpretation of the mathematical results of the real situation;
7. in the communication of the model and its results.

Concluding Remarks

One of the fundamental points of this training activity was to insist on enlarging the methodological horizon, within which to frame the technological one. The task of the trainers was to make teachers reflect on the opportunities offered by mathematical technologies in order to select those that are useful for achieving the objectives set in the design of the various learning environments. Starting from the methodological choices, the teachers were able to grasp the importance of the transformation into the usual didactic practices, thus widening the options and the choice of the most effective strategies for the cognitive and motivational needs of the students. Within this framework the mathematical technologies should be included as "reagents".

Essential heuristic strategies for problem solving were used and encouraged in the work on modelling problems. In addition, modelling problems particularly encourage communicating and arguing. In teaching of mathematics, the use of applications and modelling is important because they promote different goals at various levels.

Due to the link between mathematics and reality, mathematical modelling offers the unique opportunity to get interesting impressions in the subject of mathematics as well as in real life. In this in-service teacher training, content-related, process-oriented, and general goals of modelling have been distinguished in order to underline the importance of mathematical modelling at different levels (Greefrath 2010; Niss et al. 2007).

The example of the practice presented shows how strategic intervention can be created, based on heuristic strategies and the role played by use of mathematical technologies in problem-solving activities.

In the in-service teacher training, the heuristic strategies can act as a conceptual toolkit to analyse the complexity of a modelling problem, identify the important steps in the modelling process, and pre-formulate possible strategic support.

In this scenario, the role of mathematical technology is many-fold because it can be generated and incorporate representations which can assist in transforming an indeterminate situation into a determinate one.

Mathematical technology also plays a central role in coordinating the inquiry, reasoning, and systematising that lead to a determinate situation.

The in-service teacher training that took place within the framework of the “PSND on the Road” has partially changed teachers’ attitudes towards the modelling problems. Indeed, the teachers they have overcome that initial reluctance and have worked with great enthusiasm thus widening their cultural horizons on the integration of meaningful and realistic contexts with the use of technology into mathematics.

In conclusion, the training action has increased teachers' awareness of the fact that technologies must be considered as tools available to teaching and as such they must be used within specific pedagogical models. This is in the belief that methodological and didactic innovation in digital learning environments (as foreseen by the European Framework for the Digital Competence for Educators - DigCompEdu <https://ec.europa.eu/jrc/en/printpdf/137812>) may have place in the school only through a re-elaboration and adaptation of the professional skills of the teachers, not only on a merely instrumental level, but above all on the critical level, so that they reach the ability to rethink their didactic activity in its entirety.

Abstract

The objective of this study is to examine the mediator role of motivational self-talk in the relation of life satisfaction and mental toughness. In line with the objective of the study, 199 athletes ($Age_{mean} = 20,30 \pm 2,526$), 110 of whom were females ($Age_{mean} = 20,09 \pm 0,277$) and 89 of whom were males ($Age_{mean} = 20,55 \pm 0,206$), volunteered to participate in the research, who were doing active sports in 2017-2018 season. Sport experience of the participants was calculated as $Year_{mean} = 6.07 \pm 3.70$. In order to reach the objective of the study, Life Satisfaction Scale, Self Talk Scale, and Mental Resilience Scale were used. In line with the objective of the study, in order to determine the relations among the variables, firstly correlation analysis was conducted. Pearson correlation coefficient necessitates both of the variables to be constant and to demonstrate a normal distribution together (dually). The interpretation of the r values, which are Pearson coefficients, were conducted as such; r values in between .00-.29 indicate low relation, while in between .30 and .69 they indicate mid-level relation, and in between .70 and 1.00 high-level relation (Büyüköztürk, 2008). Statistical significance level was accepted as .05. Moreover, the PROCESS macro regression analysis was used in order for the mediator role of the motivational self talk in between the life satisfaction and mental toughness. The analyses were conducted in 95 % confidence interval, and in order to test whether the mediator role was significant, Sobel z test was used. For the analyses of the research, SPSS 22.00 package program was used. When the findings of the research are examined, it can be stated that motivational self-talk has a positive mediator role in the predictor effect of life satisfaction on mental toughness. According to these results, it can be stated that one of the factors affecting mental toughness of the athletes is life satisfaction, moreover, with the mediator role of the motivational self-talk, the effect of life satisfaction increases on the mental toughness. Considering the positive effects, it is evaluated that life-satisfaction-increasing ones should be included in the mental-toughness-increasing activities, and that steps taken to increase motivational self-talk of the athletes might be effective in increasing their mental toughness.

Keywords: *Life Satisfaction, Motivational Self Talk, Mental Toughness.*

Introduction

Neugarten had first proposed the life satisfaction concept in 1961. Fundamentally, it is the condition, or the result, obtained by comparing the individuals' expectations (what one wants) and what they have at hand (what one has) (Özer and Karabulut, 2003). Subjective well-being and life satisfaction are described by many as the primary goals of life. Subjective well-being is closely related to how the individual assesses his or her life. It is suggested that the individual's life goals, the thoughts and the emotions of fulfilling these goals play a predictive role in achieving happiness and pleasure (Rask et al., 2002).

Life satisfaction is a subject in positive psychology issues that have been on the agenda in the sports and exercise environment for many years (Gaudreau & Antl, 2008; Ardahan, 2012; Toros et al., 2010; Özkara, Kalkavan & Çavdar, 2015; Şahin, Bayköse & Civar Yavuz, 2017; Kiliç, Bayköse & Kaplan, 2018; Guhn et al., 2018; Yıldız, Gülşen & Yılmaz, 2015; Yıldız et al, 2017).

The concept of mental toughness has recently become a topic that is on the agenda of researchers who are both in Turkey (Bayköse et al., 2017; Altıntaş & Koruç, 2017; Yarayan, Yıldız & Gülşen, 2018) and in other countries (Weinberg, Freysinger & Mellano, 2018; Thelwell et al., 2005; Jones et al, 2002; Bull et al., 2005; Clough et al., 2002). Although the concept of mental toughness, which is based on theoretical foundations by researchers many years ago (Kelly, 1955; Loehr, 1982), has been associated with positive and desired psychological features related to success (Jones et al., 2002), it is stated that specific themes are repeated in the current literature (Crust, 2007). Researchers and theorist defined mental toughness as coping with pressure and negativities in a way that performance will be least affected (Clough et al., 2002; Jones et al., 2002; Loehr, 1995; Middleton et al., 2004a; Williams, 1988), overcoming difficulties and failures with increasing determination to success (Clough et al.,

2002; Goldberg, 1998; Jones et al., 2002), refusing to give up and persevering (Goldberg, 1998; Gould et al., 1987; Middleton et al., 2004a), competing with oneself and others (Bull, Shambrook, James & Brooks, 2005; Clough et al., 2002), being stable and resistant (Bull et al., 2005; Clough et al., 2002; Goldberg, 1998; Gould et al., 2002), having a steadfast belief for self-determination (Clough et al., 2002; Jones et al., 2002; Middleton et al., 2004a), development through pressure (Bull et al., 2005; Jones et al., 2002; Thelwell et al., 2005), and having superior mental skills (Bull, Albinson, & Shambrook, 1996; Golby, Sheard, & Lavallee, 2003; Loehr, 1995).

One of the most common cognitive strategies used by athletes is self-talk. Self-talk is central to cognitive and cognitive-behavioral interventions and has recently become an important research topic in the field of applied sports psychology (Conroy & Metzler, 2004). Self-talk refers to the internal or external explanations that individuals make themselves and is defined as an internal dialogue in which individuals interpret perceptions and emotions, organize and change evaluations and cognitions, and instruct themselves (Hackfort & Schwenkmezger, 1993).

Initially, researchers have distinguished between two main dimensions of self-talk including positive and negative self-talk. Positive self-talk is defined as expressions requiring praise and courage, and negative self-talk is defined as criticism and self-concern (Moran, 1996). More contemporary approaches guide self-talk according to its purposes. Zinsser, Bunker, and Williams (2001) expressed self-talk as an instructional or motivational phenomenon. While instructional self-talk is related to the statements associated with focus, technical knowledge, and tactical options, motivational self-talk indicates the statements related to creating self-confidence, effort, and positive moods. Following the researches, Hardy and his colleagues (Hardy, 2006; Hardy, Hall & Hardy 2005) made a more comprehensive definition of self-talk. They have defined self-talk as a multidimensional dynamic phenomenon related to the words that come out of the athletes' mouth. In this study, Considering the theoretical approach put forward by Zinsser, Bunker and Williams (2001), the motivational dimension of self-talk will be examined. In line with this information, the following H1 hypothesis will be tested within the scope of the research. H₁= There is a mediation role of motivational self-talk in the influence of life satisfaction on mental endurance.

Method

Research Model

This study was a relational screening model designed to examine the mediation role of self-talk levels in the relationship between life satisfaction and mental toughness. Karasar (2009) defined the relational screening models as the research models aiming at finding out the existence and degree of covariances between two or more variables. In the scope of this model, the mediation role of self-talk levels in the relationship between life satisfaction and mental toughness was examined.

The hypothesized model was shown below;

Figure 1: Research Model

Research Group

110 females (Age_{mean}: 20,09 ± 0,277) and 89 males (Age_{mean}: 20,55 ± 0,206), totally 199 athletes (Age_{mean}: 20,30 ± 2,526), voluntarily participated in the study. The sports experience mean score of the athletes was Year_{mean}: 6.07 ± 3.70.

Data Collection Tools

To reach the research purpose, Life Satisfaction Scale, Self-Talk Questionnaire and Sport Mental Toughness Scale were used. The detailed information on the scales used in the research is given below.

The Satisfaction With Life Scale-SWLS

The Satisfaction with Life Scale, developed by Pavot and Diener (1993), was used. The Satisfaction with Life Scale was a scale developed to evaluate the respondent life in the aggregate. This scale is not for assessing the living area such as health or income but allows them to be integrated. The Satisfaction with Life Scale is a 7-Likert type scale.

It is a scale including 5 items rated as 7. Absolutely agree, 6. agree, 5. agree very little, 4. Undecided, 3. Disagree a little 2. Disagree 1. Absolutely Disagree (my life in many directions is close to ideal, my living conditions are

excellent, my life satisfies me, up to now, I have achieved the important things I want in life, If I had the chance to live my life again, I would hardly change anything). The highest score one can get from the scale is 35; the lowest one is 5; the higher the score in the scale, the higher the level of life satisfaction (Pavot and Diener, 1993). The scale was used in various fields (Yetim, 1991). Pavor and Diener found the reliability of the scale as $\alpha = 0.89$. In this study, the reliability of the scale was found to be $\alpha = 0.695$.

Self-Talk Questionnaire

The Self Talk Questionnaire was developed by Zervas, Stavrou & Psychountaki (2007) for use in sports and sports environments. Turkish adaptation was conducted by Engür (2011) in a sample of 422 college athletes (157 females and 265 males). Latent variables measured by item groups related to a theoretical model created by KKA hypothesizing that there were 11 items and 2 factors by Zervas et al. (2007) were tested by using CFA in LISREL 8.51. The model fit of χ^2 / df calculated as 165.74/38=4.36. The other fit indices were calculated as RMSEA = 0.089, SRMR = 0.037, GFI = 0.93, AGFI = 0.88, NFI = 0.96; NNFI = 0.96, CFI = 0.97[3]. For the reliability of self-talk scale, reliability coefficient for motivational function subdimension was 0.94 while the value for cognitive function subdimension was 0.87 (Engür, 2011; Zervas, Stavrou & Psychountaki, 2007)

Sport Mental Toughness Scale

In the study, the Sport Mental Toughness Questionnaire (SMTQ-14) developed by Sheard et al., (2009) was applied to determine the mental toughness level of athletes. 14-item sport mental toughness scale measure three different subdimensions (Confidence, Continuity, and Control) as well as general mental toughness. The scale is the 4-point Likert type (1=completely wrong, 4=Completely right). The Cronbach's alpha values of Sport Mental Toughness Questionnaire was found to be 0.81 for Confidence; 0.74 for Continuity; 0.71 for control (Sheard et al., 2009). The fit indices of the inventory that tested with the participation of 509 athletes having age mean of 20 years were found to be GFI=0.95, AGFI=0.93, RMSEA=0.05, RMR=0.05, CFI=0.92, IFI=0.93 (Sheard et al., 2009). The Cronbach Alpha values of the Sport Mental Toughness Questionnaire adapted to Turkish culture by Altıntaş & Koruç (2017), were 0.84 for the Confidence; 0.51 for Continuity; 0.79 for Control (Altıntaş & Koruç, 2017). The fit indices for the inventory was GFI=0.90, AGFI=0.89, RMSEA=0.07, RMR=0.04, CFI=0.91, IFI=0.91 (Altıntaş & Koruç, 2017).

Analysis

Within the scope of the research purpose, correlation analysis was first performed to determine the relationships between variables. The Pearson correlation coefficient requires that both variables are continuous and that the variables have a normal distribution (in pairs). The value r , which represents the correlation coefficient, has been interpreted as follows: the relationship is low between .00-.29, moderate between .30-.69, and high between .70 and 1.00 (Büyüköztürk, 2008). The significance level was accepted .05 statistically. PROCESS macro regression analysis was used for analysis, and analysis was performed at 95% confidence interval, the Sobel z test was used to test whether the mediation was significant. SPSS 22.00 program was used for the analysis.

Results

Correlations between variables

Table 1: The relationship between life satisfaction, motivational self-talk, and mental toughness

		Life Satisfaction	Motivational Self Talk	Mental Toughness
Life Satisfaction	r	1		
	p			
	n	199		
Motivational Self Talk	r	.175*	1	
	p	.013		
	n	199	199	
Mental Toughness	r	.198**	.452**	1
	p	.005	.000	
	n	199	199	199

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

When table 1 is examined, significant differences were found between life satisfaction and motivational self-talk ($r: .175, p<0.05$); life satisfaction and mental toughness ($r: .198, p<0.05$), and mental toughness and motivational self-talk ($r: .452, p<0.05$)

Research Model

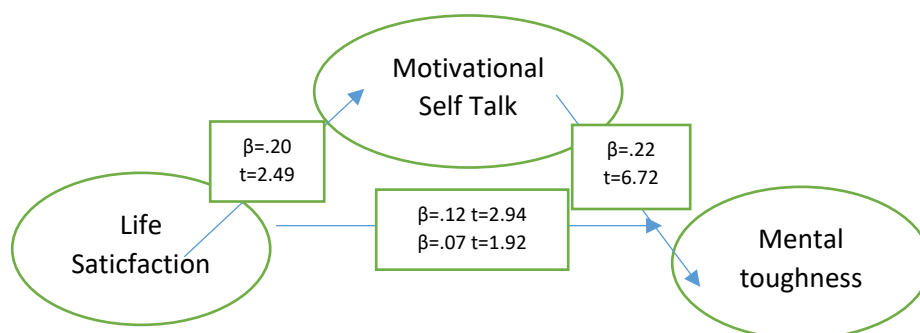

Figure 2: The mediation role of motivational self-talk of the athletes in the relationship between life satisfaction and mental toughness

The determination that there is a positive and significant correlation between life satisfaction and mental toughness allows testing the hypothesized mediation. PROCESS macro regression analysis was used to test whether motivational self-talk played a role in the relationship between life satisfaction and mental toughness. The predictive effect life satisfaction on motivational self-talk was examined in the first step of PROCESS macro regression analysis, and it was found that life satisfaction predicted motivational self-talk ($\beta=.20$, $t=2.49$, $p<.05$) at the level of 3% ($R=.17$, $R^2=.03$, $F=6.23$, $p<.05$).

In the second step of PROCESS macro regression analysis to determine whether motivational self-talk played a role in the relationship between life satisfaction and mental toughness, the predictive effect of life satisfaction on mental toughness was examined. When the results were examined, it was seen that life satisfaction ($\beta=.12$, $t=2.94$, $p<.05$) predicted mental toughness at the level of 4% ($R=.19$, $R^2=.04$, $F=8.06$, $p<.05$).

In the third step of PROCESS macro regression analysis to determine whether motivational self-talk played a role in the relationship between life satisfaction and mental toughness, motivational self-talk was included in the PROCESS macro regression analysis and found that it was seen that motivational self-talk contributed to the prediction of mental toughness at the level of 5%. Accordingly, it was found 22% of the total variances was explained via motivational self-talk in the prediction of mental toughness by life satisfaction ($R=.47$, $R^2=.22$, $F=27.54$, $p<.05$). In the third step of the analysis, it was observed that the effect of life satisfaction on mental toughness decreased ($\beta=.07$, $t=1.92$, $p>.05$). Thus, it can be said that motivational self-talk has a full mediation role in this relationship ($\beta=.22$, $t=6.73$, $p<.05$). Sobel z test, used to determine whether the mediation role was significant, showed that the mediation relation was statistically significant ($Z=2.32$, $p<.05$).

Table 3: The direct and indirect effects of life satisfaction on mental toughness

Direct Effect			Effect	S.E	LLCI	ULCI	t	p
Life Satisfaction	Mental Toughness		.074	.0383	-.0023	.1494	1.92	.050
Indirect Effect			Effect	S.E	LLCI	ULCI	t	p
Life Satisfaction	Motivational Self talk	Mental Toughness	.045	.0249	.0025	.1022	2.84	.000
Total Effect			.118	.0416	.0363	.2009		
Normal Theory Test for indirect effect								
Effect: .0487		s.e: .0195		z: 2.3181		p: .0204		

In table 3, it was found that total effect (direct + indirect) of life satisfaction on mental toughness was positive ($\beta: 0,074+0,045=0,118$) and statistically significant ($p=0,000$). Because the Z score (2,3181) of this model was higher than 1,96 and significant, the existence of a mediator effect can be said. According to this finding, H_1 (There is a mediation role of motivational self-talk in the influence of life satisfaction on mental endurance) was accepted.

Discussion And Conclusion

The direct and the indirect relationship between life satisfaction and mental toughness levels of the athletes were examined in this study. In line with the purpose of this study, 110 females ($Age_{mean}: 20,09 \pm 0,277$) and 89 males ($Age_{mean}: 20,55 \pm 0,206$), totally 199 athletes ($Age_{mean}: 20,30 \pm 2,526$), voluntarily participated in the study. The sports experience mean score of the athletes was $Year_{mean}: 6.07 \pm 3.70$.

When the results were examined, it was observed that the relationship between life satisfaction and motivational self-talk and the that between life satisfaction and mental toughness were significant. Furthermore, it was found that the relationship between mental toughness and motivational self-talk was significant.

The determination that there is a positive and significant correlation between life satisfaction and mental toughness allows testing the hypothesized mediation. PROCESS macro regression analysis was used to test whether motivational self-talk played a role in the relationship between life satisfaction and mental toughness. The predictive effect life satisfaction on motivational self-talk was examined in the first step of PROCESS macro regression analysis, and it was found that life satisfaction explained 3% of the total variances related to motivational self-talk. In this context, it can be said that increasing life satisfaction enhances motivational self-talk tendency. When the literature is examined, it is suggested that positive self-talk has a positive impact on performance and (Vab Raalte et al., 1995) and interrelated and correlated with many positive psychology dynamics (Neck & Manz, 1992).

In the second step of PROCESS macro regression analysis to determine whether motivational self-talk played a role in the relationship between life satisfaction and mental toughness, the predictive effect of life satisfaction on mental toughness was examined. When the results were examined, it was seen that life satisfaction explained 4% of the total variance related to mental toughness. In line with this information, it can be said that increasing life satisfaction contributes to mental toughness. As it is stated in the introduction, mental toughness concept can contribute to many positive components such as having a steadfast belief for self-determination (Clough et al., 2002; Jones et al., 2002; Middleton et al., 2004a), development through pressure (Bull et al., 2005; Jones et al., 2002; Thelwell et al., 2005), and having superior mental skills (Bull, Albinson, & Shambrook, 1996; Golby, Sheard, & Lavalley, 2003; Loehr, 1995), according to our results, it can be said that having a certain level of life satisfaction will provide support for mental toughness.

In the third step of PROCESS macro regression analysis to determine whether motivational self-talk played a role in the relationship between life satisfaction and mental toughness, motivational self-talk was included in the PROCESS macro regression analysis and found that it was seen that motivational self-talk contributed to the prediction of mental toughness at the level of 5%. Accordingly, it was found 22% of the total variances was explained via motivational self-talk in the prediction of mental toughness by life satisfaction. In the third step of the analysis, it was observed that the effect of life satisfaction on mental toughness decreased. Thus, it can be said that motivational self-talk has a full mediation role in this relationship. Sobel z test, used to determine whether the mediation role was significant, showed that the mediation relation was statistically significant. In line with these obtained results, it can be said that motivational self-talk mediates the relationship between life satisfaction and mental toughness. Based on the results, motivational self-talk can play a critical role in creating or increasing mental toughness studies.

Consequently, it is thought that individuals who want to contribute to the mental toughness of the athletes can benefit from motivational self-talk intervention programs as an intervention to increase their life satisfaction. Moreover, an intervention program for motivational self-talk can be developed and tested for efficiency by the researchers based on the views in literature in future studies.

Author Note

This study is an improved version of the oral presentation presented in the International Conference on New Horizons in Education held between 18-20 July.

Abstract

The objective of this study is to examine the mediator role of the self-esteem levels of the athletes in the relation between harmony-obsessive passion and psychological resilience. In line with the objective of the study, 215 athletes (106 females, 109 males) volunteered to participate in research, who were doing active sports in the 2017-2018 season. The age average of the athletes participating in the research was determined as 20.39 ± 2.49 . Sports experience of the participants was calculated as $\text{Year}_{\text{mean}} = 8.09 \pm 3.93$. In order to reach the objective of the study, Rosenberg Self Esteem Scale, Passion in Sports Scale, and Psychological Resilience Scale (Short Version) were used. In line with the objective of the study, in order to determine the relations among the variables, firstly correlation analysis was conducted. Pearson correlation coefficient necessitates both of the variables to be constant and to demonstrate a normal distribution together (dually). The interpretation of the r values, which are Pearson coefficients, were conducted as such; r values in between .00-.29 indicate a low relation, while in between .30 and .69 they indicate a mid-level relation, and in between .70 and 1.00 high level relation (Büyüköztürk, 2008). The statistical significance level was accepted as .05. Moreover, the PROCESS macro regression analysis was used in order for the mediator role of the social support perceived from the friend and the teacher in between the social support perceived from the family and tendency to cyber bullying. The analyses were conducted in 95 % confidence interval, and in order to test whether the mediator role was significant, Sobel z test was used. For the analyses of the research, SPSS 22.00 package program was used. When the findings of the research are examined, it can be stated that self esteem has a positive mediator role in the predictor effect of harmony and obsessive passion for psychological resilience. According to these results, it is obvious that the sports psychologists, trainers, or relevant managers, who want to create a resource of psychologically enduring athletes, need to support the athletes in a way to increase their self-esteem, and need to take steps in a manner to support their harmony or obsessive passion levels. Considering the psychological factors and performance relations, it is evaluated that harmony or obsessive passion, self esteem, and empowered psychological resilience might play an important role concerning the sportive performance.

Keywords: *Harmony passion, Obsessive Passion, Resilience, Self esteem*

Introduction

Self-esteem focuses on the individuals' need for self-appraisal. Self-esteem is not related to the feeling perfect, but self-awareness, self-acceptance, identity formation, and the acceptance from others (Adams and Gullotta, 1989). The individual's features and environmental conditions influence his/her perspective on life and life position. The processes such as individual's perception of being in a stressful environment, inability to develop healthy self-esteem stemming from weak and unhealthy family bonds, failure to fulfill the taken decisions or the perception of decisions being damaging for individuality have negative impacts on one's world. High self-esteem implies we found ourselves and inner world valuable (Kaya and Saçkes, 2005). In this context, having high-level self-esteem is a positive psychological feature for an individual.

Passion, in which we included in this study, is another positive psychological feature for an individual. Passion can be defined as the love that the individual possesses for the activity he or she is doing. According to the dualistic model approach by Vallerand et al. (2003), passion fundamentally has two dimensions. While the first dimension of passions is "harmony passions" including individual's passion complying with the life, the second dimension is "obsessive passion" that can be a deterrent for daily living activities.

In recent years, the research into psychology and performances of the athletes has become increasingly widespread. Both the theoretical examination of psychological skills (Bayköse et al. 2017; Bayköse et al., 2016; Thompson et al., 2011) and the experimental studies into the understanding of the relationship between psychology and performance (Moore, 2009; Raalte et al, 1995; Dagrou et al., 1992; Williams, 1993) have provided an insight for the sport sciences.

The psychological resilience concept, included in this study, is defined as a personality trait referring to the individual staying physically, mentally, psychologically and healthily positive under intense and stressful conditions (Masten, 1994; Fonagy et al., 1994; Hunter, 2001; Tusaie and Dyer, 2004). In another word, psychological resilience can be expressed as the individual's ability to recover, cope with, and succeed against the events perceived negative and stressful (Luthans et al., 2006). It is seen that psychological resilience correlated with the concepts such as passion (Bayköse et al., 2017) and self-esteem (Fergusson and Lynskey, 1996; Crocker and Park, 2004) in literature.

Starting from the finding that positive psychological factors prevented athletes from stressors (Fletcher & Sarkar, 2012), the aim of this study, which was related to the effects of passion and self-esteem on supporting psychological resilience, was to examine the mediator role of the self-esteem levels of the athletes in the relationship between harmony-obsessive passion and psychological resilience.

METHOD

Research Model

This study is a relational screening model designed to examine the mediator role of the self-esteem levels of the athletes in the relationship between harmony-obsessive passion and psychological resilience. Karasar (2009) defined the relational screening models as the research models aiming at finding out the existence and degree of covariances between two or more variables. In line with this model, the role of self-esteem in the relationship between passion and psychological resilience levels of athletes. Two different models were hypothesized in line with the research purpose. The hypothesized models are displayed as follows.

Figure 1: The first study model

Figure 2: The second study model

Research Group

106 females and 109 males, totally 215 athletes, competing actively during the 2017-2018 season, voluntarily participated in this study. The age mean score of the athletes was 20.39 ± 2.49 . The sports experience mean score of athletes was $\text{age}_{\text{mean}} = 8.09 \pm 3.93$.

Data Collection

To reach the research purpose, the Rosenberg Self-Esteem Scale, Passion Scale in Sport, and Psychological Resilience Scale (Short Form) were used. The detailed information about the data collection tools was provided below.

Rosenberg Self-Esteem Scale

Self-esteem scale was developed by Rosenberg and adapted to Turkish culture by Çuhadaroglu (1986). The scale is a self-report scale including 63 multiple choice items and has twelve sub-dimensions. In line with the research purpose, the first "ten" items of the scale were used. According to the evaluation system of the scale, participants

score between 0 and 6. The higher the score get on the scale, the lower the self-esteem level. Confirmatory factor analysis was applied to test the validity of the scale for our study. The fit indices provided enough evidence for the scale validity ($\chi^2/sd=2,28$, RMSEA=0,037, TLI=0,95, CFI=0,96).

Passion Scale for Sport

Passion Scale in Sport, adapted to Turkish culture by Keleccek and Aşçı (2013), was developed by Vallerand et al. (2003) to determine two type of passion (harmony passion and obsessive passion) to participated and interested activity. The scale was developed to evaluate passion for different activities in the different field and used in this scope today. Passion scale consists of 16 items including 6 items to assess harmony passion, 4 items to assess obsessive passion and 4 items to assess passion to activities in which individuals participate, and it is a 7-point Likert type. While the internal consistency coefficient for Obsessive Passion dimension of Passion Scale in Sport was 0,78, the one for Passion dimension was 0,83. Confirmatory factor analysis was applied to test the validity of the scale for our study. The fit indices provided enough evidence for the scale validity ($\chi^2/sd=2,83$, RMSEA=0,046, TLI=0,94, CFI=0,93).

Psychological Resilience Scale (Short version)

The scale developed by Smith, Dalen, Wiggins, Tooley, Cristopher and Jennifer Bernard (2008) to assess the individuals' psychological resilience. The scale, adapted to Turkish culture by Doğan (2015), is a self-report and 5-point Likert type scale including 6 items. After recoding the related items, the higher score on the scale, the higher psychological resilience and the lower scores, the lower psychological resilience. After the analysis done by Doğan (2015), the scale was found to be a unidimensional scale, and the factor loadings ranged between 0,63 and 0,79. Confirmatory factor analysis was applied to test the validity of the scale for our study. The fit indices provided enough evidence for the scale validity ($\chi^2/sd=2,12$, RMSEA=0,033, TLI=0,97, CFI=0,98).

Analysis

In line with the research purpose, the correlation test was applied to find out the relationship between variables. The Pearson correlation coefficient requires that the two variables are continuous and that the variables have a normal distribution together (dyadically). The value r , which represents the correlation coefficient, has been interpreted as follows: the relationship is low between .00-.29, moderate between .30-.69, and high between .70 and 1.00 (Büyüköztürk, 2008). The significance level was accepted .05 statistically. Moreover, PROCESS macro regression analysis was used. The analysis was done at 95% confidence interval; Sobel z test was used to test if mediation was significant. SPSS 22.00 program was used for the analysis.

Results

Table 1: The Relationship Harmony Passion, Psychological Resilience, and Self-Esteem

	Harmony Passion	Resilience	Self Esteem	
	r	1		
Harmony Passion	p			
	n	215		
	r	,390**	1	
Resilience	p	,000		
	n	215	215	
	r	,206**	,582**	1
Self Esteem	p	,002	,000	
	n	215	215	215

** . Correlation is significant at the 0.01 level (2-tailed).

When table 1 is examined, it is seen that a positive and linear relationship is found between psychological resilience and self-esteem. Besides, positive and linear correlation is seen between self-esteem and harmony passion.

Table 2: The relationship between Obsessive Passion, Psychological resilience, and self-esteem

		Obsessive Passion	Resilience	Self Esteem
Obsessive Passion	r	1	,452**	,385**
	p		,000	,000
	n	215	215	215
Resilience	r	,452**	1	,582**
	p	,000		,000
	n	215	215	215
Self Esteem	r	,385**	,582**	1
	p	,000	,000	
	n	215	215	215

** . Correlation is significant at the 0.01 level (2-tailed).

When table 2 is examined, a positive and linear correlation is seen between obsessive passion, psychological resilience, and self-esteem.

Research Model 1

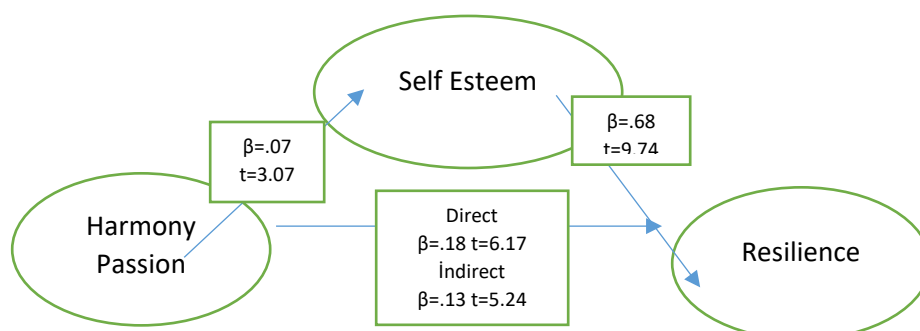

Figure 2: The mediator role of self-esteem level of athletes in the relationship between harmony passion and psychological resilience

The determination that there is a positive and significant correlation between harmony passion and psychological resilience allows testing the hypothesized mediation. PROCESS macro regression analysis was used to test whether self-esteem played a role in the relationship between harmony passion and psychological resilience. The predictive effect harmony passion on self-esteem was examined in the first step of PROCESS macro regression analysis, and it was found that harmony passion predicted self-esteem ($\beta=.07$, $t=3.07$, $p<.05$) at the level of 4% ($R=.21$, $R^2=.04$, $F=9.47$, $p<.05$).

In the second step of PROCESS macro regression analysis to determine whether self-esteem played a role in the relationship between harmony passion and psychological resilience, the predictive effect of harmony passion on psychological resilience were examined. When the results were examined, it was seen that harmony passion ($\beta=.18$, $t=6.17$, $p<.05$) predicted psychological resilience at the level of 15% ($R=.39$, $R^2=.15$, $F=38.14$, $p<.05$). In the third step of PROCESS macro regression analysis to determine whether self-esteem played a role in the relationship between harmony passion and psychological resilience, self-esteem was included in the PROCESS macro regression analysis and found that it was seen that self-esteem contributed to the prediction of psychological resilience at the level of 5%. Accordingly, it was found 41% of the total variances was explained via self-esteem in the prediction of psychological resilience by harmony passion to ($R=.64$, $R^2=.41$, $F=74.87$, $p<.05$). In the third step of the analysis, it was observed that the effect of harmony passion on psychological resilience decreased ($\beta=.13$, $t=5.24$, $p<.05$). Thus, it can be said that self-esteem has a full mediation role in this relationship ($\beta=.68$, $t=9.74$, $p<.05$). Sobel z test, used to determine whether the mediation role was significant, showed that the mediation relation was statistically significant ($Z=2.92$, $p<.05$).

Table 3: The results related to the direct and indirect effect of harmony passion on psychological resilience

Direct Effect		Effect	S.E	LLCI	ULCI	t	p
Harmony Passion	Resilience	.127	.0242	.0793	.1749	5.24	.000
Indirect Effect		Effect	S.E	LLCI	ULCI	t	p

Harmony Passion	Self Esteem	Resilience	.049	.0279	-.0003	.1108	6.175	.000
Total Effect			.176	.0285	.1197	.2319		
Normal Theory Test for indirect effect								
Effect: .0487		s.e: .0167	z: 2.9207		p: .003			

In table 3, it was found that total effect (direct + indirect) of harmony passion on resilience was positive (β : 0,127+0,049=0,176) and statistically significant ($p=0,000$). Because the Z score (2,9207) of this model was higher than 1,96 and significant, the existence of a mediator effect can be said. According to this finding, H_1 (There is a mediation role of self esteem in the influence of harmony passion on resilience) was accepted.

Research Model 2

Figure 3: The mediator role of self-esteem level of athletes in the relationship between obsessive passion and psychological resilience

The determination that there is a positive and significant correlation between obsessive passion and psychological resilience allows testing the hypothesized mediation. PROCESS macro regression analysis was used to test whether self-esteem played a role in the relationship between obsessive passion and psychological resilience. The predictive effect obsessive passion on self-esteem was examined in the first step of PROCESS macro regression analysis, and it was found that obsessive passion predicted self-esteem ($\beta=.15$, $t=3.07$, $p<.05$) at the level of 15% ($R=.38$, $R^2=.15$, $F=37,017$, $p<.05$).

In the second step of PROCESS macro regression analysis to determine whether self-esteem played a role in the relationship between obsessive passion and psychological resilience, the predictive effect of obsessive passion on psychological resilience was examined. When the results were examined, it was seen that obsessive ($\beta=.21$, $t=7.39$, $p<.05$) predicted psychological resilience at the level of 20% ($R=.45$, $R^2=.20$, $F=54,69$, $p<.05$).

In the third step of PROCESS macro regression analysis to determine whether self-esteem played a role in the relationship between obsessive passion and psychological resilience, self-esteem was included in the PROCESS macro regression analysis and found that it was seen that self-esteem contributed to the prediction of psychological resilience at the level of 5%. Accordingly, it was found 40% of the total variances was explained via self-esteem in the prediction of psychological resilience by the obsessive passion for ($R=.63$, $R^2=.399$, $F=70.53$, $p<.05$). In the third step of the analysis, it was observed that the effect of obsessive passion on psychological resilience decreased ($\beta=.12$, $t=4.64$, $p>.05$). Thus, it can be said that self-esteem has a full mediation role in this relationship ($\beta=.61$, $t=8.30$, $p<.05$). Sobel z test, used to determine whether the mediation role was significant, showed that the mediation relation was statistically significant ($Z=4.88$, $p<.05$).

Table 4: The results related to the direct and indirect effect of obsessive passion on psychological resilience

Direct Effect			Effect	S.E	LLCI	ULCI	t	p
Obsessive Passion	Resilience		.129	.0278	.0744	.1740	4.64	.000
Indirect Effect			Effect	S.E	LLCI	ULCI	t	p
Obsessive Passion	Self Esteem	Resilience	.088	.0271	.0422	.1458	7.39	.000
Total Effect			.218	.0295	.1599	.2762		
Normal Theory Test for indirect effect								
Effect: .0889		s.e: .0182		z: 4.8844		p: .000		

In table 4, it was found that total effect (direct + indirect) of obsessive passion on resilience was positive (β : 0,129+0,088=0,218) and statistically significant ($p=0,000$). Because the Z score (4,8844) of this model was higher than 1,96 and significant, the existence of a mediator effect can be said. According to this finding, H_1 (There is a mediation role of self esteem in the influence of obsessive passion on resilience) was accepted.

Discussion And Conclusion

106 females and 109 males, totally 215 athletes, competing actively during the 2017-2018 season, voluntarily participated in this study. The age mean score of the athletes was 20.39 ± 2.49 . The sports experience mean score of athletes was $\text{age}_{\text{mean}} = 8.09 \pm 3.93$.

To reach the research purpose, the Rosenberg Self-Esteem Scale, Passion Scale in Sport, and Psychological Resilience Scale (Short Form) were used. The detailed information about the data collection tools was provided below. In line with the research purpose, the correlation test was applied to find out the relationship between variables. The Pearson correlation coefficient requires that the two variables are continuous and that the variables have a normal distribution together (dyadically). The value r , which represents the correlation coefficient, has been interpreted as follows: the relationship is low between .00-.29, moderate between .30-.69, and high between .70 and 1.00 (Büyüköztürk, 2008).

The direct and indirect relationship between passion and psychological resilience levels of athletes was examined in this study. It was found that the psychological resilience of athletes could be increased if their harmony and obsessive passion levels were supported to increase self-esteem. It can be said that the results of this study were supported by some study findings in the literature.

When the results of the structural equation modeling study conducted by Bayköse et al. (2017) to examine the predictive role of self-esteem and passion on psychological resilience were examined, it was suggested that psychological resilience had positive relationships with both self-esteem and harmony passion. The results of Bayköse et al. (2017) supported our findings. In another part of the study by Bayköse et al. (2017), a negative correlation was found between psychological resilience and obsessive passion. In this context, this part of the study by Bayköse et al. (2017) was contradictory with our results. The sample difference can be the reason for this contradiction.

Many researchers suggested that self-esteem positively correlated with psychological resilience. These studies contributed to our findings in various ways (Crocker and Park, 2004; Fergusson and Lynskey, 1996; Vallerand et al. 2003). Furthermore, the results of this study supported the view that psychological resilience was supported by positive psychological factors (Fletcher & Sarkar, 2012).

According to these results, it is evident that sports psychologist, coaches, and managers, who wish the athletes being psychologically resilient, should attempt to support them to increase their self-esteem, harmony and obsessive passion levels. Considered psychological factors and performance relations, it is thought that harmony and obsessive passion, self-esteem and strengthen psychological resilience can play a key role in sports performance.

Medical Animation In Educational Virtual Environments And Its Effect On Medical Reality Perception

Amany Farouk Ramadan Ismail
Faculty of Fine Arts - Alexandria University
faroukamany@yahoo.com

Abstract

Medical animation as a visual simulation is a very effective tool in communicating medical information with more emotional impact, and more compelling, memorable, objective and succinct at a faster rate more dramatically than traditional dry oral or written formats. Medical animation plays multiple roles in shaping the notion of medical reality. It is an integral aspect in teaching, learning, and communication. Animation modules provide patients, medical educators, healthcare professionals with visual support, increasing understanding and retention of important issues, so they can develop mental models to understand the behavior of a complex physical system in the real world. This graphical representative medium doesn't only reflect and report reality, but also filters and shapes understandings of the mechanism of action of a biological system, bio-medical technology, pharmaceutical drug or an anatomical process. This paper demonstrates medical illustrative styles and the use of animation characteristics as an instructional communicative tool for medical educators and patients to experience situations through edugraphic games in a virtual environment that may be difficult to experience in reality. This paper aims to highlight an important question: does medical animation represent reality in a fully accurate or proportional way or it has sometimes false appearance due to the user's perception, or mainly due to subjective impression as well as illustrative manipulations of artists and designers as being creators of visual simulations? So getting misrepresentations and misinterpretations question the credibility of documentation and prediction of medical subjects. Finally, ended to several results the most important are: the variations in illustrative styles in medical animation depicting the movements, process of the inner workings of biomedical issues depend on spatial and temporal design considerations, perspectives, angles of views of the illustrated elements and techniques used to create proportionally accurate motion visualization in a virtual environment. Continuous co-operation between scientists and creators as media artists, designers and animators has to take place in order to achieve scientific validation of the illustrated reconstructed models and to maintain accuracy, consequently affecting the communication and perception process.

Introduction

Visualizing complex and dynamic medical scenarios is the key in the analysis and understanding of these scenarios. Medical animation as a reality depicting visual medium plays a fundamental role in the notion of medical information and health care culture. (Patrick 2018; Hajar 2011; Stephen et al 2005; Oai & Ning 2013) For patients and low health literacy people animated videos have been found to be effective, eye-catching in providing information, as it is perceived as familiar and accessible across age groups, cultures and literacy levels, it may hold the attention of viewers and improve patient recall. For medical educators animation has shown to be more effective for conveying symbolic theories and demonstrating key concepts of devices, procedures, and technology advances by delivering clear visuals in a simple format, with sufficient fidelity to cope competently with real-life critical situations. It is also a key strategy to teach crisis resource management skills. (Sheba et al 2013; Matt 2016; Datta et al 2012) For medical experts and healthcare professionals as scientists taking management decisions, depicting their own understanding about the scientific data, animation helps to gain insight into the information they are studying engaging the imagination besides revealing all the details of the subject converting complex scientific information into a compelling visual which tickle their imagination as thinkers and thought provokers (medical-animation 2018) to expand their ideas, facilitate sharing of information with other scientists and researchers.

Delivering medical reality as animated visualization is particularly significant because it involves human life, especially in a virtual environment as virtual reality, where users are fully immersed removing their reality, or augmented reality where virtual presences is allowed to be blended into their reality with minimal interference. (Herron 2016). Medical animation can be combined within virtual environments which offer skills in contexts that users could never participate in naturally, to see features that are invisible in real environments as cellular and molecular structures and provides a training environment that is rich and responsive as surgical or clinical training to control variables that are not possible to control in the real world, and to see these in action. (Oai. & Ning 2013) Medical animation may be viewed as a standalone visualization, such simulations may be viewed as an animated scene or time line or a process as mechanism of action animations or as emergency care instruction animations. (Choa et al 2008; Choa et al 2009) with the possibility of using interactive controls in different levels. The simulation of hand-eye skills using haptics is another possible use of medical animation technology, as the one that stems from the replacement of cadavers in surgical classrooms with task trainers and mannequins. (Kathleen 2008) . A very important question arises : does medical animation represent reality in a

fully accurate or proportional way or it has sometimes false appearance. There are many options for how the artists, as image creators, might depict medical issues with greater control over presentation, characterization, staging and timing.(Sheba et al 2013)They usually create or re-create illustrated structures depending on references as photographs, drawings, a live recording, developing videos, medical imaging¹, movies, or links to either as a medical experts' idea or an assumption. References are the basic and the most important beginning point of creation or depiction, though must be verified to provide accurate information for animators to show preference for coloration, style, movement, complexity, realism in design. That can help accurately to communicate the importance and meaning of what is being seen in a planned and prescribed manner without compromising ethical and legal rights.(Datta et al 2012)(Biomedical, Biotech, Cellular & Molecular 3d Animation Visualization 2018)

The virtual models created on a computer passes by sequenced stages controlled by artists, designers and animators from simple to highly detailed storyboards in the concept phase till constructed models and final presentation format. The designer develops the beginnings of a script of the medical scenario. He sets up what should happen and in what order, how long the medical animation should play and how should it appear. The artists control subtle properties and aesthetic choices to achieve the clear vision of the processes as the appropriate illustrative style, color, lighting scheme and motion techniques that are suitable for clarity. Identifying the target audience and their cognitive and perceptual aspects is critical to proper animation design. (biomedical-3d-animations2018)(Medical animation 2018) Animation programs offer increasingly adaptable and realistic tools, which give wide free space to the artists to construct, change and correct already rendered animations to users specifications. So this paper pegs two main questions: does the artistic intervention in creating medical animation in educational environment shape the notion of medical reality ? does the constructed medical illustrations, degree of manipulation and credibility of motion construction, editing techniques consequently affect the user perception and experience.?

Effectiveness Of Educational Virtual Environments On Medical Reality Perception

The mechanisms underlying the educational benefits of animation in serious²/edu-graphic³ games in virtual environments as an instructional tool lie in their capacity to improve the enjoyment, engagement, and motivation of users. Educational games teach complex cognitive skills, provide meaningful and challenging tasks, with flexibility in use and scalability where users can directly experience the consequences of their decisions in an extraordinary new way, from unique points of view and motivate them to go deeper where they are immersed in complex, feedback rich problem spaces. They can practice specific scenarios which help them effectively transfer the acquired skills to the real world. The effect of educational games on medical users satisfaction, knowledge, skills, attitude, and behavior are still in debate, depending on the validation and reliability of information, mode and the delivery format of medical content and other aspects. (Dankbaar et al 2017;S. De Ribaupierre, et al 2014 ; IV. Alexandrova et al 2011;Christopoulos 2013)

The game scenario designer often has his own personal view on how to arrange the scenario. The designer can control different presentations of animation in educational games as:

- one scenario which usually do not confer actual practical skills because it prevents the user from being fully immersed in the situation such simulations may be viewed passively (Figure 1)⁴but sometimes interactive controls are added from low to higher levels.(Figure 2)⁵(Kathleen2008) The scenario usually designed to explain surgical procedures or pharmaceutical mechanisms of action in terms simple enough for a layperson to understand, also may be used in order to get fully informed consent from patients facing surgery or medical treatment.(Lai-Chu et al 2011) or learning mechanism of action of certain subject.(Figure 3)⁶
- multiple scenarios :where the level of interactive training and immersion can be increased by creating a realistic working environment as virtual reality based training exercises to teach procedural skills in

¹Computer imaging in medicine :using medical scans, such as computed tomography (CT)using thin pencils x-rays beams or magnetic resonance imaging (MRI)using large magnetic fields with pulsed radio waves. Ackerman, MJ. (2011)

²A serious game is a game designed for a primary purpose other than pure entertainment. serious games are a subgenre of serious storytelling, where storytelling is applied outside the context of entertainment, where the narration progresses as a sequence of patterns impressive in quality.(lugmayr, artur et al 2016)(djaouti, damien;et al 2015)

³educational graphics, or edugraphics, are graphic visual representations of educational information intended to simplify social culture content, the term "edugraphic" is born from a related term :infographic the first international conference on graphics education, was held in alvor, algarve, portugal 1993 with the name edugraphics. santo, harold p. (1993).

situations of varying complexities as surgical simulation, a simulated intensive care unit coupled with feedback from observers(Figure 4)⁷or High fidelity Software Simulation which is designed to allow the mimicking of human physiological conditions for a variety of clinical scenarios,in addition to high fidelity manikin where realistic, programmable manikins behave like real patients that are capable of simulating a wide range of clinical scenarios; including simulating cardiac arrest, seizure, etc. Finally,Virtual Patient Game where interactive clinical scenarios take place in an entirely virtual world designed to practice team training in high risk situations like avatars within a virtual health facility. (Kononowicz et al 2015). Role-playing with someone taking on the role of a patient, interacting with the trainee, was one of the first types of serious games introduced in nursing education(Minhuaet al 2014)

Figure 5 : A Digital Revolution: Games, Simulations, and Virtual Worlds in Nursing Education
(Stokowski2013) https://www.medscape.com/viewarticle/780819_4
(accessed February2018)

More accurate structure in the design process must be taken in consideration, thereby creating more effective scenarios, guiding design principles are needed to help game scenario designers where the focus lies on one scenario or on the progression of multiple scenarios.(Hartog 2009)

Coming to the concept of ‘unconstrained play’ rises risk-free training , and brings into sharp focus the necessity of a clearly articulated well-designed accurate instructional content for medical educational games. Selecting the games, the sequence order for the user, the interaction mode are main considerations, the games are adapted to the current level of the user to ensure the optimal degree of challenge without cognitive overload. The majority of users prefer to explore with a human guide, because it allows direct interpersonal interaction with which the educator can immediately adapt to the users and solve doubts or provide more information. The role of the medical expert as a teacher and a guide should ensure that the user does not over-learn one small fragment of a necessarily broad skillset. (S.DeRibaupierre et al2014;Hargreaves2018;Hartog2009; Christopoulos 2013)

The plausibility illusion which is the illusion that what is apparently happening in the virtual environment is really happening and defines that the key component for its realization is the existence of events in the virtual world over which the user has no direct control . So a bidirectional flow of information and action, by handing at certain moments control over to the game, so that not all information and actions would come from the educator. Through the usage of in-game characters at the various interest points in the virtual environment and mainly during the completion of a task, medical information is provided and events initiated which advance the storyline. Both the educator and user are forced to cooperate in order to advance the story. The reception of information and tasks both from the educator and the animation allows not only the direct participation in an interactive experience but also the passive observation placing the user in the middle of the action. (Christopoulos 2013). If the game is so engaging, the context and conditions in a scenario have to be designed taking into consideration: task (subject)arrangement, complexity progression and the balance between short and long cyclic scenarios.

Designing a game scenario mainly consists of the translation of learning goals into specific elements in a scenario to create the right elements associated with each competency or learning goal by confronting the users with various elements of the scenario - in clinical or emergency situation -they are required to assess the situation(situational assessment), make a decision and task selection and sequencing, followed by the task activities, thereby acquiring

⁷Figure 4:watch video on <https://www.hybridmedicalanimation.com/work/virtualreality/medical-device-virtual-reality/>(accessed February2018)

the necessary competencies (Hartog2009) in such a way that the learning goals are reached, and the user as a learner has experienced all aspects of his real job and has built the necessary practical experience. Experts as well as educators will have to work in collaboration with the artists, designers, animators, computer software or game developers. Ideas can be tested very early in the concept process or in the design stage, or through creating a clickable or coded prototype. It also means that a scenario should give proper feedback on the performance of users. The elements in the final scenario should consequently be 1) of educational value, 2) technically feasible and 3) realistic, in which a conceptual design is continuously refined into an implemented final version. Objective measures based on speed and accuracy at all levels not only provide an evaluation of the learning process, but serve as the scores for these gaming activities in virtual environment for healthcare education. (S.DeRibaupierre et al2014;Hargreaves2018;Hartog2009)

When evaluating medical animation in an educational game a fundamental question arises: How well does the final visualization represent the underlying medical information to achieve the user's goal? This question involves two aspects:

First: the evaluation of the technical efficacy, intrinsic quality, or technical image quality of the representation. How well does the visualization approximate the medical information to be understood? Is the visualization realized through graphic illustrative styles and motion editing that will produce the final animated images? Though analyzing the characteristics of the model, as timings, rendering, processing, framerates within its hypothetical/original context, as well as matching any hypotheses alternative to the shaping of some of its parts are basic considerations of design. In addition to checking if the visualization: 1) successfully highlights the target medical information, does it distort this information, if it transforms it in some way, while providing context for that information. 2) transforms nominal interval, and quantitative information properly. 3) reveals trends, patterns, gaps, or outliers. 4) provides insight to some situation or answer a specific question. (Aragon 2017 ; Hartog2009 ; Beatriz & Dillenseger2005 ; Beatriz 2008).

Second the evaluation of the semantic efficacy: the performance of the user at interpretation tasks when using the visualization, which implies the understanding of the underlying medical information, considering the purpose of the medical visualization and who is the intended audience, the user's motivation or goal: how well does the construction of a specific model from the data help the users to understand the underlying subject and perform their task? examining readability of the visualization whether it is immediately understandable after a short period or does it require excessive cognitive effort? How does this make users feel? Is the process clear? Are designers thinking of the user's wants and needs, or their own vision only? What do the designer want users to do?

Strategy is then translated into design through illustrative and technical styles determining the emotional reaction to the visualization, whether it is generally positive or negative, with examining in detail which helps to better understand not only what works and what doesn't, and also by how much, to gain insight into why. (Interrante 2005; Aragon 2017; S. de Ribaupierre, et al; Katharine 2018; Beatriz & Dillenseger2005; Farouk 2017)

Medical Illustration Credibility And Degree Of Manipulation: Balancing Creativity, Clarity And Reality

Artists have been visualizing medical world bringing a reinterpretation of medical issues throughout centuries in various forms of artistic expression. Artistic intervention of medical illustrators and animators as image creators presents a potential tool for facilitating and deepening communication that redress the balance of power in interaction between health professionals, medical experts, medical educators and students or patients. The artist goal often concerns the provision of emotional insight, rather than purely medical education knowledge. The artist doesn't act as a conduit for science, but account for a medical aesthetic beyond didactic when interpreting and visualizing medical data. (Tsafrir & Ohry 2001; Hajar2011).

An artist can articulate an alternative aesthetic illustrated image to that of reductive plain medical information. He has the ability to tell stories through medical animation and potentially widen accessibility to medical imagery. This does raise several questions about the integrity of the illustrated and animated images: How far does the artist interpret the medical data? Does the artist reflect or construct reality? exactly or distortedly? Does the artist imitate and project or embody and build up medical reality? A major issue is the aesthetic choice of where to strike the balance between realism and clarity in medical animation. (Weber2002; John2010; medical-animation-2018)

Illustrating a medical concept is difficult and can be tricky. (Hajar2011) Artistic manipulation is regarded as involving material changes in the processing of an image construction through the addition or subtraction or modulation of content. (Boering 2015) Medical images' manipulation has been used legitimately, to allow superposition or clarity enhancement, for medical educational or experimental and scientific purposes without physical intervention, to avoid misrepresentations and though misinterpretations. (Tsafrir & Ohry 2001) But artists as visual communicators adapt certain techniques, not with an intent to change the truth of what they were attempting to articulate, but to make images featured and characterized (McNally2015) to attract the attention of the recipient and keep him on the path of the image not through the process of revoking the reality but may sometimes beyond the limits. (Mike M.1993) Such manipulation questions the credibility of documentation in

medical animation.(Tsafrir& Ohry2001) Some artists think any degree of manipulation is possible so they may filter and manipulate for the sake of aesthetics striving for an impossible level of perfection and idealism in their work. (Lyttle2015)

Artists aim to highlight medical world and tell stories in their own artistic vision depending upon their own experiences plus the credit medical reference which determine the motivation behind each stage of the animation from the concept creation to the final representation.(McNally2015)for example medical illustrators draw the steps taken during procedures and create illustrations of both healthy and diseased body parts to explain the effects of medical conditions. (Hajar 2011) demonstrating how healthy tissue functions or how various ailments impair that function. Claiming that neither illustration, nor animation certainly isn't all the truth, an artist can formulate or stylize the same animated elements in different ways, with different interpretation of the real world.(McNally2015)Manipulation is not equivalent to processing or editing through an illustrative style. All images are processed or edited, and levels of processing are aesthetic judgments and do not by themselves violate real medical reality information. The only point at which processing becomes manipulation is when transforming significant parts of an image(Campbell 2015) as addition or subtraction to the medical content or moving around information blatantly.(McNally2015)The medical artist should draw or animate the medical issue with scientific precision and at the same time brings artistic creativity to his work. (Hajar2011)

Creating medical animation requires a significant amount of technical experimentation prior to any creative intervention. Visualizing real reality may require the highest degree of mechanical artificiality. Articulating, stylizing, processing, editing and even manipulation has penetrated so deeply into the reality construction in order to appear real. 'The clearer real reality is suggested the more constructively there is behind it'. The appropriateness of a more abstracted visual narrative need images that describe medical scenarios in a more accessible and holistic way, as rendering on a higher level of abstraction, semantics and user interaction have to be taken into account.(John,M2010 ; J. Diepstraten et al 2003 ; Weber2002)

There is a potential for artistic intervention at almost every stage in medical animation practice, from the concept (creative) development including; Storyboarding, (Figure 6) animatics or pre-visualization (Figure 7)⁸, concept art (character and environment)passing by the production phase as character creation, the environments that run the story of the animation, modeling, texturing, rigging, animating, lighting, rendering and animation tests,(Figure 8) ending to post production phase including editing compositing, adding visual and sound effects,titles and credits andfinal rendering and presentation. (Boering2015 ; Getting start with a 3D animated movie 2015)

There is and always will be much debate about the degree of modifying of medical illustration. (Campbell2015)The mere fact of replacing or changing places to produce an image involves a choice that might represent reality in a partial manner.(Boering2015). This doesn't mean to emphasize and suggest a culturally critical pessimism in the sense of a loss of the reality or a distancing from one reality and proposing a reality of distorted media constructions.(Weber2002) and also doesn't mean to direct the composite images to falsify awareness and hide the truth, and perhaps to raise the value of surface issues, temporary and transient things over the real, because the images are no longer based on similar , but on the basis of composition and hybridization, which gave a way for the potential of counterfeiting and forgery.(Mike 1993)So minor changes may be accepted while excessive changes are prohibited, but what counts as minor versus excessive changes are necessarily interpretive with artists and judged by medical experts who value those images on a case-by-case basis. There should be a clear line demarcating these concepts, the ways used to explain the rules on artistic manipulation should be cleared improved for example setting up a series of video tutorials that show artists what kinds of manipulations are not allowed, regardless of the technical process through which that addition or removal is achieved.(Boering2015)An artist and scientist interaction is extremely useful in advancing art and medical issues.(Hajar 2011)

Form Structure Of Illustrative Styles In Medical Animation

Constructed images in medical animation has a high ability to attract attention, as it guides the user as students patients or medical educators to meanings that help his mind to recognize and translate its content and relate it to familiar reality. The constructed illustrative styles may raise mystery and surprising in the image especially when finding a difference or unpredictable when linking between the real world view and the user physiological and social needs. The artist is able to influence the recipient using unusual forms, and combination of existing and non-existing visible. A huge potential ways and methods of various images' manipulations depict, reflect, produce a new or unusual represented vision as 1) modification of familiar forms 2)changing or modifying known laws of nature 3)interactions or blending between different forms (metaphor) 4)giving unreal features or characteristics to certain characters 5)Combining things that are impossible to meet in real world. Those techniques consequently affect the recipient mental and visual perception and shape the notion of medical issues. When he sees such strange and different forms from what he has accustomed to and stored in his mind, he attempt to find a relation between these forms and others, the mind begins the process of building a new database of these forms, which may require a relatively long time to realize the differences with new characteristics, then he tries to link between them finding convincing reasons for these changes, until they are well understood and interpreted. The process of cognition is equipped and prepared to recognize each element on its original real form, as well as to recognize its properties and characteristics that are familiar to the mind and have acquired knowledge during experience and perception.(Mikkel & Rudolph 1992 ; Mike 1993 ; Giemsa 2007;Wettlaufer 2003). so adding any new modulated information is at stake, especially that medical information is almost new for the user.

Creating medical animation depend mainly on identifying the appropriate kind of illustrative style which represent the medical issue and affects its validity and reliability. Those styles are specified to encode particular information about important features of the subject within the graphical representation. Concentration on certain issues and

subjects with certain representative styles leads the users to perceive those issues as more important than others (John 2010 ; J. Diepstraten et al 2003 ; Weber2002).

Concerning the degree of visual realism whether it is actual/apparent realism or iconicity/ symbolic, there are different illustrative styles how the medical subject can be represented graphically: If the purpose of the medical issue is to depict a specific location of an organ for example and the users are supposed to recognize elements in that issue, then the degree of realism should be high, and it will be necessary to use the most detailed information which is easy to interpret with extraction of the relevant features, as accuracy addresses the issue of the truthfulness or fidelity of the visualization imagery to the actual or expected appearance of the medical subject. Medical illustrations can be created as perspective representations, the more natural the perspective the more complex it will be. Using vanishing point perspective depict bodies as realistically as possible, while parallel perspective may be used to improve the recognition of the shape and structure of objects, their orientation, or spatial relationships in non photo realistic styles.

Realistic representations depict the medical subject and its physical characteristics in the simulated environment depending on creating and composing alternative world to reflect facts as close to reality as possible and suit the medical subject documentation. The task is to record imagery in all its details and simulate the desired effect for convincing using computer graphics imagery as pictorial elements to create the illusion of reality which in fact might either does not exist or cannot be seen by the human eye. (Figure 9)⁹Highly stylized realistic illustrations with most details available in the medical information requires a great deal of knowledge about both the 3D modeling and the rendering of a specific type of virtual environment, as hyper real visualization incorporates and often capitalizes upon photographic limitations such as depth of field, perspective and range of focus to create a tangible solidity and physical presence through subtle lighting and shading effects so the users can recognize the features' identities in the virtual environment which affect spatial cognition.(Figure 10)

Figure

Non realistic representations as stylized and abstract imagery can reduce visual complexity of images, and the level of detail which guide the user's eye towards important features in an animation. Non realistic representations may take several forms as iconic, symbolic, and others to visualize abstract information, communicate spatial complex and thematic information for medical issues. (Figure 11) These representations facilitate guidance of a user's gaze to prioritized information and predicted steps which may exist only in the scientist's imagination. When it comes to concentrate on essential features and reveal concepts, low visual realism is applied which requires interpretation of the abstract symbolism in the animation. It may possible to reuse existing objects or drawn elements but adapt the size and orientation of each element as it will change wherever it appears in the new issue. (J. Diepstraten et al 2003; Giemsa, 2007; Dykes et al 2005; Bishop & Ecrat 2005; Kettunen et al 2012; Farouk 2016)

medical scenarios may vary between realistic and nonrealistic or a combination of both styles based on the relation between the representation and its referent and the complexity of the information represented. The illustrator has artistic freedom to use various stylistic devices to support the purpose of the animation. The use of perspectives, graphic devices and simplifications are valuable tools for emphasising key details in an animation. Illustrations reveal the shape and appearance of important parts, plus the position and orientation of these parts in the context of the surrounding structures. However, creating illustrations that clearly depict the spatial relationships between parts is not an easy task. The primary problem is matching and managing. Most complex 3D objects contain many tightly connected and intertwined parts that occlude one another.

Illustrators carefully choose viewpoints that help the users to see the spatial relationships between the internal target parts they are interested in. Typically, the viewpoint not only centers the target parts in the animation, but also minimizes the number of occluding structures. This strategy makes it possible to expose the parts of interest with relatively few cuts, leaving more of the surrounding structures intact for context. For example, when depicting the inner workings of biologic systems as the events that take place inside of cells which are nearly invisible to all forms of visual analysis. If interior parts are to be shown, the occluding parts can be shown as transparent, or completely cut away, or removed in sequence as during a surgical technique where inner structures gradually come into view as the surgery progresses. (medical-animation2018) There are variety expressive visualized representation methods that artists can create with several illustrative styles, the purpose of the animation distinguish the choice of that representation method, the most important of these representations are: 1) Cut-away/cross section views where a section or part section which allows to see through the surface and perceive other surfaces or structures behind. (Figure 12). (J. diepstraten et al 2003; Giemsa 2007; Ivan & Gröller 2005; Farouk 2011)

Figure 12: Eye Anatomy Cross Section
 still scene : 3D Medical Animation watch video on <https://medical3danimationcompany.com/project-attributes/medical-illustration/page/2/> (accessed February 2018)

2) Ghosting views in which transparency is used as the dominant method. so elements or objects are semi-transparent illustrative views. The inner parts of an object can be seen by displaying the outer case as if it is transparent. (Figure 13) (Giemsa, 2007; Ivan & Gröller 2005; Farouk 2011)

The artist controls constructing stylistic devices to shape the user notion of medical reality are varied which enables him to percept the meaning of the illustration more easily such as line weights, line types which may form patterns to convey regular and irregular textures through choosing appropriate weighs and spacing for those lines. Illustrative rendering techniques include the use of non-physical or exaggerated lighting and shading models that emphasize the shape, texture and reflection properties of the depicted elements. The artist should think about what to depict and how to arrange the parts so that the structure is clear and avoid making the visualization too ornate as too much detail will distract the viewer and obscure the meaning. In this context the effects and strengths of various stylistic devices become apparent as it enables the user to see the meaning of the illustration more easily.(Mitra et al2010;Giemsa 2007;Ivan& E.Gröller 2005;Farouk 2011)

Motion Construction And Motion Editing In Medical Animation:

The main goal of medical animation is to synthesize the desired motion effect precisely which is a mixing of natural phenomena, perception and imagination. The animator designs and specifies the dynamic behavior of the elements in medical scenarios not only with his mental representation of causality and academic backgrounds but with a help of a medical expert to produce an accurate dynamic visualization in a fraction of the time. He tries to transform the vision of the elements' behaviors into a realistic and conceived animation depending on the required result and how the user is going to interact with.(Thalmann2001;Steven et al 2003; medical-animation 2018)

The motion in medical animation can be created or derived from a reconstruction of the subject with motion control methods as keyframe (computer animation), simulations and motion capture to translate the desired motion according to the context subject. Amotion control method specifies how the mechanism of action of elements in a biological system, bio-medical technology, pharmaceutical drug or an anatomical is animated. A combination of blending of methods can be used and provide good results. There are two aspects of a motion representation: the representation of the medical element character at any given instant in time and how these specific instants are varied across time.(M. Jung et al 2000;Thalmann,2001;Patrick 2018)

The user as a recipient is not assigned to analyze the motion techniques used in medical edugraphics, whatever the method is, his relationship to those techniques is a relationship of vulnerability, not analysis, and the process of understanding and perceiving the contents of the medical subject comes in the first place. If the user begins to analyze the construction of used motion technology, it will get on the content or the meaning presented, which

separates the user from that meaning in favor of technological use . Using motion techniques within the context has a direct emotional impact on the user so technology must remain within the context of the receiving sense and not perception . Diversity and differences in techniques, just are creative agents that the creator seeks for high communicative level, to achieve more interaction with the user. This means to send signals and semantics which help to build the imagined image in his mind . responsiveness with intents and desires arises as a result of mental and emotional connection between the user and the animation in the virtual environment . All this leads to the creation of a specific communication, whatever the motion technique used, it is employed to serve the aim of the animation and correspond to the nature of the users.

Key framing motion(key frame animation)

Creating realistic motions with accurately mimic subtle characteristics requires a great deal of skills to build objects and scenes to achieve medical reality. An animator creates a simplified representation of an object anatomy which is called skeletal animation. The position of each segment pose of the skeletal model is defined by animation variables (avars). Animators specify a series of many individual poses to create properties of the motion using key frames to define the position and orientation of objects at specific points in time so changing the values of avars over time and the computer provides the motion in between to achieve the smooth motion of the objects. Realism in computer animation can mean making each frame look photorealistic, in the sense that the scene is rendered to resemble reality and make the animation believable and lifelike. Diagrammatic or schematic illustrative styles can represent physiological processes and the mechanisms of dysfunction that cause disease as an abstract concept. The animator has his own space to think and create real or false appearance of the medical elements in certain time with certain movement; what motion is going to be added or emitted depending on his accurate interpretation and understandings of the represented medical subject. (Gleicher 1999; Patrick 2018; Steven et al 2003; Masson 1999; Parent 2012; medical-animation 2018)

Computer simulation (simulated motion):

Simulation generates motion of objects using numerical simulation (algorithmic) methods depending on computer programs, which rely on the laws of physics and engineering to analyze the event and produce the motion. (Figure 15a-b) Simulation is the artificial representation of a complex real-world process to simulate physical processes and phenomena with sufficient fidelity and relies on the input data to be consistent with the elements in portrayed medical scenarios with the aim to facilitate learning through immersion, reflection, feedback, and practice minus the risks inherent in a similar real-life experience of which can be complicated, hazardous, expensive, and time consuming in many situations. (Figure 16)¹⁰ Medical simulation offers numerous potential strategies for comprehensive and practical training, and safer patient, the output data from simulation are fed directly into animation as if both steps take place simultaneously. One key problem facing algorithmic methods is how to describe a complicated motion or a subtle nuance. So the animator credibility creation depends upon his skills and equivalent of the constructed motion to reality. Simulation Perceptual accuracy requires stability, ease of use, speed, robustness to transform science into a technically-accurate, visually-dramatic experience. (Datta et al 2012; Oai & Ning 2013; Patrick M. 2018; Gleicher 1999; hybrid medical animation 2018)

Motion capture animation:

Capturing the motion is an aspect of creating medical animation from observations of real motion. An artist create animation from observation through several steps :1) Planning the motion capture shoot and subsequent production.2)Capturing the motion.3)Cleaning the data.4)Editing the motions.5)Mapping the motions to the animated elements.When computer animation is driven by motion capture, a real motion is recorded to a computer using video cameras and markers,or a real performer acts out the scene as if he is the character to be animated and that motion is then applied to the animated subjects or character especially in clinical or surgical animation virtual cases.Motion capture is appropriate in situations where believable, realistic behavior and action is required, as it provides a large collection of realistic motion data.(Masson1999) (Figure 17a-b) (Figure 18) ¹¹ (Figure 19)¹²

Changing and editing motions seems to be a big part of the use of motion capture where reality is reconstructed. There is a need to create the observations that are then interpreted, motion capture creates a representation that distills the motion from the appearance; that it encodes the motion in a suitable form for the kinds of processing or analysis needed to be performed depending on the final result. Motion capture for animation implies that the animator will somehow be changing something about what have been recorded.in other words to what extend and how farmotion database reusability and flexibilityis going to take place.The limitations of editing come from the library of motions available to adapt, and the quality of the tools available for adapting motions to new needs.(Gleicher 1999)

Motion Editing

The need to control the motions of objects is an essential part of any animation. The animator as a creator control over the motion to better convey- not to manipulate - clear biomedical content which accordingly affect the user perception. Motion editing can be applied to motion created with key-framing and simulation, as well motion capture. Animators edit created, recorded or real observed motions of medical data, they often make alterations to the motion, for reasons including:

1) reflecting an accurate reconstruction through the clean-up process which is a specific type of edit to motion capture. 2) re-using the medical data for something slightly different as a different action from the exactly recorded data. 3) creating infeasible motions and impossible actions or experimenting some speculations or predicting alternatives. 4) adjusting imperfections of reality. 5) addition of secondary motion. (Gleicher 1999; Komura 2006; Rick 2006; M. Jung et al 2000)

Adaptation, retargeting, editing and reusing motion is challenging, because the motion was acquired for a specific character within a specific environment in a specific style and mood. so constraint-based approaches specify features to be retained, new features to be accomplished with a new motion to satisfy given constraints, while preserving the characteristics of the original motion as much as possible. Relation with environments, dynamic constraints, subtle details accomplish new features for the target motion and new characters/environment, new style/mood are defined. Animators select motion segments from the database that will be modified, blended, and stitched using variety of motion editing tools. (hybrid medical animation 2018)

Creating a believable realistic performance and designing effective real motion through motion editing, shouldn't depend mainly on the artist imagination and technical skills but presenting the medical elements or objects' behaviors is the main goal, not how good the animator is at making something move. The animator should understand exactly the mechanics of the action of the animated elements, study how the character whether a human or an object moves: timings, arcs, speed changes, overlapping actions compression and extension, balance, weight, motivation, the medical issue or objective behind the action, to determine the past and the following steps. Discussing the action with the medical expert or the specialist involved with the issue is very significant to determine the accurate location of the action need to happen, in a certain distance and exact timing interacting with other objects to make the action feel more responsive. Adjusting a good motion can lose something of the depicted reality, the motion may no longer be physically correct, or may lose some nuance given by the animator. Good transformations preserve important aspects of the motion by altering less important ones. The animator must look at motion editing as a creative process where decisions are made as to how best to keep the originality of the motion while meeting new needs. Over all, medical animation should have no limits on creativity, and overtly constructed imagery has much to say about medical world. But for educational, documents and evidence images clear standards are necessary to underwrite their credibility. (Campbell 2015) and shouldn't depend mainly on pure artistic imagination but should also rely on scientific facts and hypothesis of a team of researchers and experts.

Conclusion

Medical reality could be recorded, reconstructed or processed in as an animation in a virtual environment depending on the accuracy of the artist's references as a visual creator, and his perception, interpretation of scientific information, imagery, in addition to his constructed illustrative styles, his motion controls of medical elements in the final visualization.

Balancing realism, aesthetic and clarity in medical animation depend on spatial and temporal design considerations depicting the movements, process of the inner workings of biomedical issues perspectives, angles of views of the illustrated elements and techniques used to create proportionally accurate motion visualization.

Medical simulations in virtual environments mannequin based, screen based and virtual reality simulator provides multiple benefits to different users as medical educators and patients to understand the known and explore the unknown, practice rare and critical situations. But educational serious games for medical and health care learning is not effective and do outcome negative learning, change awareness and twist the notion of medical reality without a good evaluation of the visual content, objectives, in addition to studying the user behavior during the development of the game scenario design to create safe and controlled virtual environments which eliminate risk to patients, enhance visualization, and contexts for learning and assessment.

Credibility of medical animation has to undergo several verifications to ensure the accuracy of the delivered information though bridging the gap between scientific instrumentation and the artist's experimentation. Finally, continuous co-operation between scientists and artists has to take place in order to achieve scientific validation of the illustrated reconstructed models and to maintain accuracy, consequently affecting perception of medical reality.

erkant.turan@hotmail.com

Özet

Netflix Şirketi, abone olunan paketlere göre evlere posta servisi ile DVD gönderimi yaparak medya sektörüne giriş yapmıştır. İlk zamanlar, filmler izlendikten sonra internetten yenisini sipariş ederek eskilerini de yine posta yoluyla geri gönderimi yapılabilmekteydi. 25 Şubat 2007’de 1 milyarını DVD’sini teslim eden firma 2015 verilerine göre dünya çapında 57,4 milyon abone sayısına ulaşmıştır. Netflix’in başarısı üzerine Türkiye’de de benzer DVD kiralama servisleri kuruldu ancak korsan sektörü sebebiyle aynı başarıyı gösterememişlerdir. Sonraki süreçte Netflix dijital dünyaya ayak uydurarak internet üzerinden film kiralama hizmetini sunmaya başlamıştır. Birçok farklı platformda uygulama geliştirerek, abone sayısını genişleten Netflix, 130 ülkede daha servis vermeye başlayarak dünyanın en büyük dijital içerik sağlayıcılarında biri haline gelmiştir.

Netflix üyeliğine sahip kullanıcılar, çevrimiçi bağlanarak, portalda bulunan dizi, film ve video içeriklerine ulaşabilmektedirler. Televizyonun geleceği olarak konumlandırılan Netflix tarzındaki TV portalları, teknolojik ve estetik çekicilikleriyle, hedef kitlelerine prestij imkanı sunmaktadır. Dolayısıyla Netflix benzeri TV portalların hemen hemen hepsi kendilerini televizyonun geleceği olarak konumlandırmaktadırlar. Netflix, reklam ve tanıtım kanallarını kullanarak, özgün ve kaliteli programlarıyla ön plana çıkmaktadır.

Çalışmamız kapsamında Netflix TV Portalının konumlanışını televizyon sektörünün geleceği açısından analiz ederek, çeşitli istatistiklere göre yorumlamaya çalışacağız. Çalışmamız Haziran 2018 tarihindeki veriler dikkate alınarak çözümlenmeye çalışılmıştır. Çalışma kapsamında, en etkin kitle iletişim araçlarının başında gelen televizyonun yeni bir formu olan Netflix TV Portalı örneği üzerinden bir çok güncel veriye ulaşarak analiz edilmiştir. Analizimizde, portalın sosyal medya ağlarındaki popülerliğinden, sitenin günlük ziyaretçi sayılarına ve en çok izlenen yapımlara varıncaya kadar çeşitli bilgiler tasnif edilip, analizi yapılmaya çalışılmıştır.

Medyada Kadın Temsili Sorunu Üzerine Bir Değerlendirme

Nesrin AKINCI ÇÖTOK

Doç. Dr. Sakarya Üniversitesi, İletişim Fakültesi,
nakinci@sakarya.edu.tr

Özet

Kadının medyada temsilinin sorunsallığı üzerine yapılan tartışmaların başlatıcısı feminist hareketler olmuştur. Bu yöndeki feminist hareketlerde amaç, medyada kadın imgesinin yer alışındaki mevcut durumu dönüştürmek ve toplumsal cinsiyet eşitliği bağlamında yönlendirebilmek yönünde gerçekleşmektedir. Çelenk (2010:230) 'e göre medyada kadın temsili 1970'li yıllarda feminist medya çalışmaları aracılığıyla kadını ikincil konuma iten toplumsal süreçlerin medyadaki kadın temsilleri ile etkileşim içinde kurulduğuna dikkat çekmiştir. Bu dönemde iletişim çalışmaları alanında kültürelci perspektiflerin hakim olması, medya temsilinin "inşacı" olduğu, başka bir deyişle, "toplumsal"ı yansıtmaktan çok inşa ettiği görüşünü öne çıkarmıştır. Feminist medya çalışmalarının bu inşa meselesini, kadınların toplum hayatındaki ikincil konumunu pekiştiren bir toplumsallığın sembolik yeniden üretimi olarak yorumladığı açıktır. Medyanın toplumsal cinsiyet algısını pekiştirdiği gerçeğinden hareketle- ki bu algının kadını ikincil konuma yerleştirilmesi- toplumsal kurumların temsillerinde yer alan kadın cinsiyeti ve toplumsal cinsiyet eşitliği adına yapılan her tür girişimi de sonuçsuz bırakabileceğini düşündürebilmektedir. Bu noktadan değerlendirildiğinde literatürde incelenmiş medyada yer alan her tür içeriğin kadının sosyal rolü adına tercih edilmeyen biçim taşıdığı görülmektedir. Çalışmada toplumsal cinsiyet çalışmaları içinde kadın çalışmalarının yer aldığı ve sorunsal olarak vurgulanan özellikler ortaya konulup değerlendirilmektedir. Buna göre medyada, kadın sorunlarına ilişkin duyarsızlık, kamuoyunun önünde kadına ikincil toplumsal cinsiyet olarak hiyerarşik bir algının yerleştirilmesi vb. olumsuz süreçler yer almaktadır ve bu süreçler bu algının meşruiyet kazanmasına da sebebiyet vermektedir.

Anahtar Kelimeler: Medya, Kadın, Toplumsal Cinsiyet, Kadın sorunları

Giriş

Şüphesiz kadın cinsiyeti ile ilgili araştırmalar tüm dünyada ve Türkiye'de sosyal bilimler çerçevesinde önemli bir çalışma alanı olarak yer almaktadır. Hükümet politikalarında, üniversitelerde, araştırma merkezlerinde toplumsal cinsiyet ve doğrudan kadını ilgilendiren konular öncelikli olarak çalışılmakta ve kadın sorunlarının çözülmesi için işbirlikleri çerçevesinde çalışmalar yapılmaktadır. Kadın sorunları denildiğinde ise ilk akla gelen problematik alan kadına şiddet meselesi olmaktadır. Kadına şiddet olgusunun ortadan kaldırılması kadın çalışmalarındaki temel meselelerden biri olmakta ve bu doğrultuda hükümetler ve STK'lar da ortak olarak çalışmalar yürütmektedir. Bu çalışmalar dünyada BM önderliğinde yer almakta ve kadına şiddeti doğuran ve bunu yaygınlaştıran her tür dinamik analiz edilmekte ve şiddet ortadan kaldırılmaya çalışılmaktadır. Aile ve Sosyal Politikalar Bakanlığının(2016), 2016-2020 dahilinde kadına yönelik şiddetle mücadele ulusal eylem planı çerçevesinde 4 yıllık süreçte ülkedeki her tür kurumun alması gereken önlemler ve çalışmalar sıralanmıştır. Türkiye'de 2013 yılında 6284 sayılı kanun kapsamında kadına karşı şiddetin önlenmesine dair kanuna ilişkin uygulama yönetmeliği çıkarılmış ve kadına, çocuğa ve aile bireyleri hakkında şiddetin önlenmesine yönelik usul ve esaslar düzenlenmiştir. Bu bağlamda kadın konuklarının açılması yönetmeliği ve şiddet önleme ve izleme merkezleri hakkında yönetmeliklerin oluşturulması başlıca atılan adımlardır.¹

Kadına yönelik şiddet sorununun yanısıra çocuk evlilikler ve bu evliliklerin yasal zemini olmayışına dikkat çekmek söz konusu edildiğinde medyaya büyük görevler düşmektedir. Çocuk evlilikler sorununa bakıldığında BM verilerine göre dünya çapında 700 milyondan fazla kadının 18 yaşına gelmeden evlendiği görülmektedir. Ayrıca bunların üçte birinden fazlasının evlilik yaşı ise 15 yaşından da küçüktür. Yine yoksul kız çocuklarının erken evlenme olasılıkları varlıklı olan yaşlılarına göre 2,5 kat daha fazladır (ASPB, 2016:6). Bununla birlikte dünyada her üç kadından birinin eşi veya birlikte olduğu erkek tarafından fiziksel veya cinsel şiddete maruz kaldığı gerçeği yapılmış çalışmalarla ortaya çıkarılmıştır. Yine öldürülen kadınların % 38'inin faili eşleri veya birlikte oldukları erkekler olduğu görülmüştür. Bu kapsamda kadına yönelik şiddetle mücadele 4 başlık altında ortaya konulmuştur(ASPB, 2016b:4)

-Mevzuat çalışmaları

-Eğitim ve farkındalık artırma çalışmaları

-Kurumlar arası işbirliği ve koordinasyonu artırma

-Şiddet mağduru kadınların korunması ve desteklenmesine yönelik kurumsal mekanizmaların güçlendirilmesi

¹ Aile ve Sosyal Politikalar Bakanlığı'nın 2016-2020 yılları arasını kapsayan Kadına Yönelik Şiddeti Önleme adına yapılabilecek her tür çalışma kapsamı içinde özellikle Sakarya ili içinde söz konusu sorunu önleme adına çeşitli çalışmalar yapılmaktadır. Valilik bünyesinde oluşturulmuş her kamu kuruluşundan temsilcilerin yer aldığı komisyonda çeşitli projeler, çalıştaylar, konferanslar ve eğitim seminerleri ile tüm kamu kuruluşları liderlerine supervizyon hizmeti verilmektedir.

Bu başlıklar altında kadına yönelik şiddetle mücadelede çalışmalarını sürdüren Aile ve Sosyal Politikalar Bakanlığı medyada yayınlanmak üzere çok sayıda kamu spotları ve belgesel niteliğinde kısa filmler hazırlamıştır. Oral (2016:91) ‘a göre kamu spotları hakkında genel bir tarama yapıldığında televizyon ekranlarında en çok sırasıyla devlet kuruluşları, özel kuruluşlar ve sivil toplum örgütlerinin kamu spotu yayınlattığı görülmektedir. Bunların arasında en çok kamu spotu yayınlatan grubun, devlet kuruluşları olduğu ve bunların içinde de en çok yer alanların, T.C. Sağlık Bakanlığı, T.C. Aile ve Sosyal Politikalar Bakanlığı, T.C. Emniyet Genel Müdürlüğü, T.C. Adalet Bakanlığı olduğu, bunları diğer kurum ve kuruluşların takip ettiği gözlenmektedir. Oral, sağlık alanında kamu spotlarının etkililiği üzerine çalışma yapmış ve kamu spotlarının kitleler üzerinde etkili olduğu sonucuna varmıştır.

Şüphesiz toplumsal sorunlara dikkat çekmek ve farkındalık yaratma adına medyanın önemi kaçınılmazdır. Bu sebeple toplumsal cinsiyet çalışmaları dahilinde de kadın ve erkeğin rollerine ve sorumluluklarına ilişkin olarak medya önemli bir araç olarak kullanılabilir.

1. Görsel Medya ve Kadın Temsili

Televizyon, geniş kitlelere seslenmesi noktasında öncelikli kitle iletişim araçlarından biri olarak yer almaktadır. Televizyon ayrıca toplumda kültürel yapının ayrılmaz bir parçasıdır ve sosyal yapıyı anlamada ve açıklamada önemli dinamikler sunmaktadır. Televizyon programlarının niteliği, takibi, sevilen ve tercih edilenleri vb. hususlar söz konusu toplumun kültürel dinamikleri hakkında bilgi edinmemizi sağlamaktadır. Öte yandan televizyon ile ilgili ilk dönem çalışmaları içerisinde önemli bir yer tutan Halloran vd. (1973)’e göre televizyon toplumsal davranışlara yön veren en temel etmendir. Özellikle de şiddet ve saldırganlık gibi toplumsal bireyler üstündeki kötü etki edebilecek duyguların ana kaynağı olarak görülmektedir. Televizyon rasgele bir gözlemsel öğrenim kaynağı hizmeti görür ve bu öğrenim, çocuğun kendisini televizyondaki kişilerle özdeşleştirmesi yanında deneyim oluşturur. Televizyonda gösterilenin ‘gerçekçiliği’ gözlemsel öğrenimi doğrudan etkiler ve özellikle düşle gerçeği ayırma süreci-içindeki çocuklarda bu konu büyük önem taşır. Dolayısıyla çocuklar televizyonda gördükleri dünyanın gerçek dünyayı yansıttığına inanırlar. Yetişkinler dahi gerçek yaşamdaki rollerini oynamak için televizyondaki örneklerle dayanırlar. Araştırmalar televizyonun verdiği şiddetin saldırgan davranışı dürttüğünü gösterir ve bu nedenle çocuklar televizyonda gördükleri saldırgan davranışları kolaylıkla öğrenebilirler.

Salırgan davranışların öğrenilebilir olmasında medya, özellikle de televizyon birincil konumdadır. Şiddetin insan doğasına taşınan açıklamaları dışında diğer taraftan bireyin yaşantı edinimleri esnasında şiddetin öğrenilerek kazanıldığına dair açıklamalarıyla sosyal öğrenme kuramı (A. Bandura) ilgi çekicidir. Ona göre şiddet öğrenilmiş bir davranıştır. Şiddet algısı sosyalleşme sürecinde bireyler tarafından içselleştirilmekte bu nedenle de yetişkin çağında bu durum sorgulanmamakta ve normal olarak karşılanmaktadır (Çötök, 2015). Dolayısıyla aile içinde yaşanan iletişim problemlerine dayalı öğrenilen şiddetin yanında kitle iletişim araçları içinde televizyondan öğrenilen şiddet ve saldırganlık, kişide bu dürtülere dair eğilimi doğrudan üretmektedir. Bu noktada medyada yer alan özellikle de toplumsal cinsiyet bağlamında ikincil konumda sergilenen kadına şiddet sorunu bu sorunu pekiştirme ve çözüm arayışlarını ortadan kaldırılmasına sebebiyet verebilmektedir. Kadına şiddet sorununu da anlayabilmek şüphesiz şiddet olgusunu anlama ile başlayabileceği gibi o toplumsal yapıya bağlı olarak cinsiyet ilişkilerinin de irdelenmesini gerekli kılar. Sen (2006:296)’in de belirttiği gibi cinsiyetçi toplumlarda kadınların eşitsiz muamelelere (şiddete) maruz kalmaları türünden geleneksel eşitsizlikler ya da diğer ırksal gruplara mensup kişilere karşı uygulanan ayrımcılık; varlığını (geleneksel mazlumların itaatkar rolleri de içinde olmak üzere) devralmış inançların sorgusuz sualsiz kabullenilmesine borçludur. Geçmiş uygulamaların ve varsayılan kimliklerin çoğu sorgulanma ve ince eleyip sık dokuma karşısında dağılıp gitmiştir. Ona göre, gelenekler tek bir ülke ve kültürde bile değişim gösterebilmektedir. Şiddetin kültürel yapıyla beraber öğrenilmesi ve içselleştirilmesi bağlamındaki temellendirme günümüzde birçok araştırma sonuçlarıyla da doğrulanmaktadır.

Televizyonun toplumsal yaşama doğrudan etkilerinin yanında toplumsal cinsiyet algısı, kadın ve erkek rolleri, sorumlulukları, kadın ve erkek ilişkisi vb her tür ilişkisel iletişimi yönlendiren yapısı göz ardı edilemez. Televizyonda toplumsal cinsiyet özellikle de kadın temsili söz konusu edildiğinde kadın imgesini ortaya koymada ortak kullanılan çerçeveler şöyle sıralanabilir. (Erzurum,2014:108)

1-Haberin öznesi olarak kadın: Haberde kadın;

-Doğal- eşit bir varlık olarak mı?

-Eş, anne, fedakâr kadın olarak mı?

-Nesneleştirme;

*Magazin nesnesi

*Cinsel haz nesnesi

*Örgüt-eylem nesnesi

*Araçsal varlık

2. Sunucu olarak ve içerik üretiminde kadınlar: Bu aşamada habercilerin ve kameramanların, haberin sunuluşunda yer alan öznelerin içinde kadınların payı ve dış ses kullanımları medyada kadın temsiliinin nasıl yer aldığı ile ilgili ipuçları sunmaktadır.

Öte yandan görsel medya içinde dizi filmlerin en çok tercih edilen programlar olduğu görülmektedir. Dizi filmler içinde kadın imgesinin nasıl sembolize edildiği, en az haber programlarında kadın cinsiyetinin nasıl yer aldığı

kadar önemli bir durumdur. Aydın vd. (2014)' in yapmış oldukları araştırmaya göre özellikle yerli dizilerde yer alan kadın imgesi şöyle sıralanabilir.

- Dizilerde düşünsel boyuttan çok duygusal-duygulanımsal boyut ön plandadır.
- Dizi içinde farklı hatta bazen çelişkili içerikler bir arada bulunabilmektedir.
- Mutlak evliliği ve anneyi kutsayan aile odaklı söyleme sahiptirler.
- Fiziksel açıdan egemen güzellik kalıplarına uygun güzel kadınlar ve erkekler genellikle ana kahramanlardır.
- Geleneksel rollerle modern kalıplar birleştirilir.

Öte yandan kadın imgesi dizi filmlerde beden imgesi ile tanımlanmakta, kadın bedeni yüceltilmekte, estetiği temsil etmekte, fiziksel çekicilik mutlak suretle ön plana alınmaktadır.

2. Yazılı basında Kadın İmgesi

Yazılı basında kadının yer aldığı haber metinleri incelendiğinde kadınla ilgili olarak yer alan başlıca olgunun kadına şiddet haberleri olduğu görülmektedir. Öztunç,(2017:4)'a göre toplumda meydana gelen şiddet haberleri, gerilim ve olumsuzluk yarattığından dolayı daha fazla ilgi çekmekte ve yazılı medya bunu kullanmaktadır. Kadına yönelik şiddet olayları da bu çerçevede değerlendirilmektedir. Yazılı basın bu tür haberleri sunarken suç olgusu üzerinde farkında olarak veya olmayarak, suçu övme, suç tekniğini öğretme, işlenen suçu olağan, çekici, heyecan yaratıcı hale getirme, suç delillerinin karartılması veya adaleti yanıltma vb. gibi etkilerin ortaya çıkmasına dahi neden olabilmektedir.

Yazılı basının kadına yönelik şiddet temsiliinde toplumda var olan cinsiyet eşitsizliğini yeniden ürettiğine ilişkin çalışmalar bulunmaktadır. Bu çalışmalarda yayınlanan haberlerde cinsiyetçi bir söylemi benimseyen kuruluşların kadına yönelik şiddeti nasıl meşrulaştırdığı ve doğallaştırdığı üzerinde durulmaktadır. Dolayısıyla cinsiyetçi söylemler ataerkil yapıyı pekiştirmektedir (Erol, 2014:38). Ataerkilliğin kanıtı bilindiği gibi bir cinsiyetin doğal olarak diğerinden üstün olduğu sav'dır. Bu durum dünyanın hemen hemen her yerinde bulunan bir model olarak erkeklerin kadınlara hükmettiği toplumsal bir örgütlenme şekli olarak görülmektedir (Kaya, 2012: 330).

Öte yandan Odabaş (2012:209) 'a göre ataerkillik sadece kadın bedenlerini değil, erkek ve diğer cinsel azınlıkların bedenlerini de şekillendiren ve kuşatan bir toplumsal düzendir. Bu düzen erkeklerin bedenlerine de sert, sağlam, başarılı, sağlıklı, kaslı ve güçlü olma, evi geçindirme, çok para kazanma, kadın gibi kıvrıtmama, ağlamama ve sızlanmama, hasta olmama, vs. değerleri yükler. Erkekleri hayatta sürekli bir erkek olma mücadelesi vermeye zorlar. Erkekler bu mücadelede bir yandan ataerkil değerleri ve eril kültürü üretirler ve paradoksal bir biçimde bu kültürün mahkûmu olurlar.

Sonuç yerine

Medyada kadın imgesinin yer alışı toplumsal yapıda toplumsal cinsiyet algısını doğrudan etkileyen dinamiklerin başında gelmektedir. Kadının medyada toplumsal kültürel ve siyasal olarak konumlanması, kadın cinsiyetine yüklenen anlam, haber programlarına, reklamlara, dizilere, filmlere yansıdığı gibi, çift taraflı etkileşim ile medyada kadının yer alışı şekli doğrudan toplumsal kitleleri de etkilemektedir. Bu etkinin sonuçları olumlu veya olumsuz olarak toplumsal tabana yayılmaktadır ki olumsuz etkilerin başında kadına şiddet yer almaktadır. Medyada özellikle de kadına şiddet olgusu haber bültenlerinde sık sık karşılaşıldığı şekilde sayıca fazlalığı ile meşru hale getirilme riski taşımaktadır. Öte yandan dizi filmlerde halen bu olgunun yer aldığı sahnelerin ortaya konması ve ataerkilliğin üst düzeyde savunulduğu- sorgulanmadığı sahnelerin yer alışı, kitleleri doğrudan olumsuz etkileyen toplumsal cinsiyet algısı olarak karşımıza çıkmaktadır.

Diğer taraftan medyanın özellikle de medyadaki dilin erkekler tarafından kurulmuş bir söylemi söz konusudur. Bu söylem içinde kadınların konumlanması ataerkil algıyı tekrar ve tekrar üretmektedir. Bu üretimin dönüştürülmesi ve medyada kadın imgesinin ortaya konmasında kadınların sadece cinsel kimlikleriyle değil ekonomiden-politikaya, kültür-sanattan spora her tür alanda özne olarak yer alışının medyada yansıtılması gerekmektedir. Şüphesiz medyada kadın ve erkek cinsinin medyada yer alışı biçimlerine ilişkin zihniyet değişikliği iyi bir medya okuryazarlığı sürecine sahip olmaktan geçecektir. Arsan(vd 2009)'dan aktaran Ersöz (2016:77)'e

göre medyada kadının konumlanması; ev işi yapan ama bakımlı fiziksel olarak çekici, boyun eğen, talep eden sabretmesi gereken, rıza göstermesi gereken bir cins olarak yer almaktadır. Erkeğe ise tam zıddı olarak üzerine gidilmeyecek, rahat bırakılacak, evliliğe ikna edilecek ve zorlanmayacak bir baskın karakter olarak yer verilmektedir. Bu bakış açıları cinsiyetlerin kendilerini toplumsal yaşam içinde konumlandırmalarına dair öğretici bir algı sunmaktadır. Bu algı cinsler arasında eşitsizlik yarattığı gibi bu eşitsizlik de kadına şiddet, kadının ikincil konumda görülmesi vb. birçok sıkıntıyı beraberinde getirmektedir.

Medyada toplumsal cinslerin kurgulanışı ve aralarındaki ilişkilerin analizi için küçük yaşlardan itibaren verilecek medya okuryazarlığı eğitimleri gereklidir. Medya okuryazarlığı, medyadaki dilin kötüye kullanımından, cinsel içerikli ve şiddet içerikli programların kaldırılmasına, medyada toplumsal cinsiyet eşitliğinin gözetilmesinden, kadın erkek cinslerin rolleri ve sorumluluklarına kadar A dan Z'ye medyanın içinde yer alan her tür görsel uyarıcı ve konularının incelenmesi ve olumsuz durumların eleştirilerek gerekli makamlarca ortadan kaldırılmasını sağlayacaktır. Küçük yaşlardan itibaren kazandırılacak medya okuryazarlığı becerisi bu bağlamda medyada kadın ve erkek toplumsal cinsile ilgili her tür olumsuzluğu ortadan kaldırmaya yarayacak farkındalığı kazandıracaktır.

Özet

Bu araştırmanın amacı mesleki ve teknik liselerde öğrenim gören öğrencilerin derse katılım düzeylerini belirlemektir. Bununla birlikte öğrencilerin derse katılım düzeylerinde, cinsiyet ve sınıf düzeylerine göre anlamlı bir farklılık olup olmadığı belirlenmiştir. Araştırma betimsel tarama modelinde gerçekleştirilmiştir. Araştırmanın çalışma grubu rastgele örnekleme yöntemi ile Sakarya İli merkez ilçedeki mesleki ve teknik liselerden seçilmiştir. Üç liseden toplam 500 öğrenciye ulaşılmıştır. Veriler, Wang, Bergin ve Bergin'in (2014) geliştirmiş olduğu ve Sever (2014) tarafından Türk kültürüne uyarlanan "Derse Katılım Envanteri (Classroom Engagement Inventory)" ile toplanmıştır. 23 madde ve beş boyuttan oluşan envanterin Cronbach-Alpha iç tutarlık katsayısı 0.93 bulunmuştur. Verilerin analizi için normal dağılım sonuçlarına göre parametrik ve non-parametrik testler yapılmıştır. İstatistiksel analiz işlemleri sonucunda elde edilen bulgulara göre öğrencilerin bazen derse katıldıkları belirlenmiştir. Genel olarak öğrencilerin derse katılım düzeyleri cinsiyet ve sınıf düzeyi değişkenlerine göre farklılık göstermemektedir. Bilişsel, duyuşsal ve davranışsal katılım alt boyutlarında ise değişkenler açısından farklılıklar olduğu tespit edilmiştir.

Anahtar Kelimeler: *Mesleki ve Teknik Lise, Derse Katılım, Bilişsel Katılım, Duyuşsal Katılım, Davranışsal Katılım, Öğrenci.*

Giriş

Eğitim kurumlarında öğrenci katılımı, öğrencilere deneyim kazandırmak, öğrencilerin gelişimlerini desteklemek, öğrenme çıktıları kazanmalarını sağlamak ve dolayısıyla kurumların performansını arttırmak amacıyla, hem öğrenciler hem de kurumlar tarafından zaman, çaba ve diğer bütün kaynakların işe koşulduğu bir süreçtir (Trowler, 2010). Genellikle öğrenci katılımı, öğrencilerin derste yapılan öğrenme-öğretme etkinliklerinde aktif rol alması ve burada gösterdiği performansın değerlendirilmesi olarak ifade edilmektedir (Kuh, 2009; Akt: Yıldırım, Sökmen, Taş ve Dilekmen, 2016).

Fredricks, Blumenfeld ve Paris'e (2004) göre katılım; bilişsel, duyuşsal ve davranışsal boyutlarla açıklanmaktadır. Bilişsel katılım, öğrenme-öğretme sürecine öğrencilerin psikolojik açıdan katılmaları ve öğrenme stratejilerini üst düzeyde kullanmalarınıdır. Duyuşsal katılım, öğrencilerin derse katılmaya istekli olmaları, öğretmenleri ve arkadaşları ile iyi ilişkiler kurmaları, öğrenme-öğretme sürecinde yapılan tüm etkinliklerden zevk almalarıdır. Davranışsal katılım, öğrencilerin okul ve sınıf kültürüne uygun olumlu davranışlar göstermeleri, öğrenmeye çaba harcamaları, okul içinde ve okul dışında yapılan etkinliklere katılmalarıdır (Fredricks, Blumenfeld ve Paris, 2004).

Okulda öğrenme-öğretme sürecinde öğrencilerin bazıları derse katılım gösterirken bazıları da derse katılmamaktadır. Derse katılım, kimi öğrenciler için kolay ve eğlenceli iken kimi öğrenciler için de zor ve sıkıcı olmaktadır (Eryılmaz, 2014). Öğrencilerin derse katılmaları, kendi öğrenme sorumluluğunu almalarında ve etkili öğrenmelerinde önemli görülmektedir (Çelik, Örenoğlu-Toraman, ve Çelik, 2018). Öğrenme öğretme sürecinde öğrencilerin öğrenebilmesi için kendilerini derse vermeleri ve bilişsel, duyuşsal ve davranışsal açıdan derse katılmalarının sağlanması gerekmektedir (Yılmaz, 2017). Verimli bir derse katılımında bu üç boyut işe koşulmalıdır. Örneğin, öğrenci derse fiziksel olarak katılım göstermiş olsa dahi duyuşsal ve zihinsel olarak kendini derse vermemiş olabilir (Saritepeci ve Yıldız, 2014). Öğrenciler, derse katılmaya istekli olduklarında, yaptıkları çalışmalara ilgi duyarlar ve karşılına bir engel ya da zorluk çıksa da bunu aşarak zevkle çalışmalarına devam ederler. Öğrencilerin derse katılmaları, öğrenme-öğretme sürecinin başarılı bir şekilde gerçekleştiğini gösteren önemli unsurlardan biridir (Fletcher, 2015). Berliner'e (1984) göre öğrenmenin gerçekleştiği en uygun zaman öğrencilerin ders etkinliklerine katıldıkları zamandır. Bu zaman diliminde öğrenciler etkinliklerde aldıkları görevi başarılı bir şekilde tamamlarsa akademik başarı da sağlanmış olur (Akt: Güner-Yıldız ve Melekoğlu, 2016).

Alan yazında derse katılımı ilgili yapılan çalışmalar incelendiğinde genellikle derse katılım ölçeklerini geliştirme ve uyarlama çalışmaları (Eryılmaz, 2014; Yıldırım, Sökmen, Taş ve Dilekmen, 2016) ile farklı lise türlerinde öğrenim gören öğrencilerin (Sever, Ulubey, Toraman ve Türe, 2014; Güneri, 2018; Çelik, Örenoğlu-Toraman ve Çelik, 2018) ve öğretmen adaylarının (Eren, 2013) derse katılımlarına yönelik ve derse katılımın diğer kavramlarla (akademik başarı, motivasyon, özyeterlik vb.) ilişkisini (Eryılmaz ve Aypay, 2011; Lee ve Reeve, 2012; Başören,

2015; Sarıtepeci ve Yıldız, 2014; Güner-Yıldız ve Melekoğlu, 2016; Güneri, 2018; Bala-Bulut, 2017; Çelik, Örenoğlu-Toraman ve Çelik, 2018) inceleyen çalışmalar bulunmaktadır. Sadece mesleki ve teknik lise öğrencilerinin derse katılımlarına yönelik bir çalışmaya rastlanılmamıştır.

Türkiye’de, ülkenin gelişmesi adına üretime katkı sağlayacak bireylerin nitelikli ve gerekli donanıma sahip bir şekilde yetiştirilmesi açısından mesleki eğitimin önemi sıklıkla gündeme gelmektedir. Mesleki eğitimin ilk basamağı olan mesleki ve teknik ortaöğretimde öğrenciler, genel kültür eğitimiyle birlikte onları mesleğe, iş alanlarına ve geleceğe hazırlayan mesleki eğitim sürecinden de geçmektedir (Türk, 2015). Bu süreçte öğrencilerin bilgi, beceri ve yeteneklerini geliştirmelerinde ve daha başarılı olmalarında derslere katılım sağlamları önemli görülmektedir. Bu bağlamda araştırmada mesleki ve teknik lise öğrencilerinin derslere katılım düzeylerinin belirlenmesi amaçlanmıştır.

Yöntem

Araştırma, betimsel tarama modelinde gerçekleştirilmiştir. Tarama araştırmaları, bireylerin görüşlerini betimlemeyi amaçlar ve “ne, nerede, ne zaman, hangi sıklıkta, hangi düzeyde, nasıl” gibi soruların cevaplandırılmasına olanak sağlar (Büyüköztürk, Kılıç-Çakmak, Akgün, Karadeniz ve Demirel, 2010: 231). Araştırmanın çalışma grubu rastgele örnekleme yöntemi ile Sakarya İli merkez ilçedeki mesleki ve teknik liselerden seçilmiştir. Üç liseden toplam 500 öğrenciye ulaşılmıştır. Öğrencilerin 133’ü kadın, 367’si erkek öğrencidir. 211 öğrenci 9. sınıfta, 134 öğrenci 10. sınıfta, 116 öğrenci 11. sınıfta ve 39 öğrenci de 4. sınıfta öğrenim görmektedir.

Veriler, Wang, Bergin ve Bergin’in (2014) geliştirmiş olduğu ve Sever (2014) tarafından Türk kültürüne uyarlanan “Derse Katılım Envanteri (Classroom Engagement Inventory)” ile toplanmıştır. 23 madde ve beş boyuttan oluşan envanterin Cronbach-Alpha iç tutarlık katsayısı 0.93 bulunmuştur. Alt boyutların güvenirlik katsayıları; birinci alt boyut “duyuşsal katılım” 0.877, ikinci alt boyut “davranışsal katılım-uyma/itaat” 0.827, üçüncü alt boyut “davranışsal katılım-sınıf katılımı” 0.746, dördüncü alt boyut “bilişsel katılım” 0.890 ve beşinci alt boyut “derse katılmama” 0.697 bulunmuştur (Sever, 2014: 178). Verilerin analizinde, verilerin normal dağılıp dağılmadığını belirlemek için cinsiyet ve sınıf düzeyi değişkenlerine göre normallik testi Kolmogorov Smirnov ve ShapiroWilk testleri yapılmıştır. Normal dağılım sonuçlarına göre parametrik ve non-parametrik testler yapılmıştır.

Bulgular

Meslek lisesi öğrencilerinin derse katılım düzeyleri ile ilgili istatistiksel bilgiler tablo 1’de gösterilmektedir.

Tablo 1. Öğrencilerin derse katılım düzeyleri

Boyutlar	N	Minimum	Maksimum	Ortalama	Standart Sapma
Duyuşsal Katılım	500	1,00	5,00	3,16	,988
Davranışsal Katılım-Uyma/İtaat		,75	3,75	2,45	,745
Davranışsal Katılım-Sınıf Katılımı		1,00	5,00	3,30	,908
Bilişsel Katılım		1,00	5,00	3,21	,847
Derse Katılmama		1,00	5,00	3,56	,964
Toplam Puan		1,30	5,00	3,27	,673
Derse Katılım Düzeyleri					

Aritmetik puan ortalamaları; 1.00-1.80 arası “hiçbir zaman”, 1.81-2.60 arası “nadiren”, 2.61-3.40 arası “bazen”, 3.41-4.20 arası “çoğunlukla” ve 4.21-5.00 arası “her zaman” şeklinde yorumlanmıştır. Tablo 1’e göre öğrencilerin derse katılım düzeyleri için toplam puan ortalaması 3.27 bulunmuştur. Buna göre meslek lisesi öğrencilerinin derslere **bazen** katıldıkları söylenebilir. Alt boyutlar açısından puan ortalamaları, duyuşsal katılım 3.16, davranışsal katılım-uyma/itaat 2.45, davranışsal katılım-sınıf katılımı 3.30, bilişsel katılım 3.21 ve derse katılmama 3.56 şeklindedir. Bu bağlamda meslek lisesi öğrencilerinin derslerde, duyuşsal katılım, bilişsel katılım ve davranışsal katılım-sınıf katılımı için **bazen**, davranışsal katılım-uyma/itaat için **nadiren** katılım gösterdikleri söylenebilir. Bununla birlikte öğrencilerin **çoğunlukla** derse katılmamayı tercih ettikleri belirlenmiştir.

Meslek lisesi öğrencilerinin derse katılım düzeylerinin cinsiyete göre bir farklılık gösterip göstermediğini belirlemek için önce normallik testi yapılmıştır. Normallik testi sonuçları tablo 2’de gösterilmektedir.

Tablo 2. Cinsiyete göre normallik dağılımı

	Cinsiyet	Kolmogorof Smirnov			Shapiro Wilk		
		İstatistik	df	p	İstatistik	df	p
Duyuşsal Katılım	Kadın	,077	133	,054	,977	133	,024

Derse Katılım Düzeyleri	Erkek	,032	367	,200*	,997	367	,690

p<0.05

Tablo 2'ye göre öğrencilerin cinsiyetlerine göre derse katılım düzeyleri toplam puan için normal dağılım gösterirken ($p=0.2$, $p>0.05$), alt boyutlar için normal dağılım göstermemektedir ($p<0.05$). Bu bağlamda cinsiyete göre öğrencilerin derse katılım düzeylerini belirlemek üzere parametrik testlerden t-testi kullanılmıştır. Alt boyutlar için parametrik olmayan testlerden Mann-Whitney-U testi yapılmıştır. Sonuçlar tablo 3 ve tablo 4'te gösterilmektedir.

Tablo 3. Cinsiyete göre öğrencilerin derse katılım düzeyleri

	Cinsiyet	N	Ort.	s.s.	s.d.	t	p
Toplam Puan	Kadın	133	74,8476	15,01846	,691	,158	-,468
	Erkek	367	75,5820	15,66814			

p<0.05

Tablo 3'e göre meslek lisesi öğrencilerinin derse katılım düzeyleri cinsiyete göre anlamlı bir farklılık göstermemektedir ($p=-0,468$; $p>0.05$).

Tablo 4. Alt boyutlar için öğrencilerin cinsiyete göre derse katılım düzeyleri

	Cinsiyet	N	Sıra Ort.	U	p
Duyuşsal Katılım	Kadın	133	225,14	21032,000	,018

	Erkek	367	241,24		
	Toplam	500			

p<0.05

Tablo 4 incelendiğinde, cinsiyete göre meslek lisesi öğrencilerinin derse duyuşsal katılımları erkek öğrencilerin lehine anlamlı bir farklılık göstermektedir ($U=2102$; $p<0.05$). Derslerde, erkek öğrencilerin (Ort.=259,69) kadın öğrencilere göre (Ort.=225,14) duyuşsal katılım düzeylerinin daha yüksek olduğu söylenebilir. Bununla birlikte cinsiyete göre öğrencilerin derse katılmama düzeyleri kadın öğrencilerin lehine anlamlı bir farklılık göstermektedir ($U=21007$; $p<0.05$). Kadın öğrenciler (Ort.=276,05), erkek öğrencilere (Ort.=241,24) göre daha fazla derse katılmamaktadır. Başka bir deyişle erkek öğrenciler kadın öğrencilere göre daha fazla derse katılım göstermektedir. Diğer alt boyutlar açısından cinsiyete göre anlamlı bir farklılık bulunmamıştır ($p>0.05$). Meslek lisesi öğrencilerinin derse katılım düzeylerinin öğrenim gördükleri sınıf düzeylerine göre farklılık olup olmadığını belirlemek üzere önce normallik testi yapılmıştır. Normallik testi sonuçları tablo 5’de gösterilmektedir.

Tablo 5. Sınıf düzeyine göre normallik dağılımı

	12	,074	39	,200*	,980	39	,718

$p<0.05$

Tablo 5’e göre sınıf düzeyine göre öğrencilerin derse katılım düzeyleri toplam puanda normal dağılım gösterirken ($p=0.2$, $p>0.05$), alt boyutlar açısından normal dağılım göstermemektedir ($p<0.05$). Bu bağlamda öğrencilerin öğrenim gördükleri sınıfa göre derse katılım düzeylerini belirlemek için parametrik testlerden F testi-Anova yapılmış, alt boyutlar açısından farkı belirlemek üzere parametrik olmayan testlerden Kruskal Wallis H testi yapılmıştır. Sonuçlar tablo 6 ve tablo 7’de gösterilmektedir.

Tablo 6. Sınıf düzeyine göre öğrencilerin derse katılım düzeyleri

	Toplam	500				

$p<0.05$

Tablo 7'ye göre meslek lisesi öğrencilerinin sınıf düzeyine göre derse katılım düzeyleri alt boyutlarında sadece duyuşsal katılım boyutunda anlamlı bir farklılık bulunmaktadır (Ki-kare=11,741; $p<0.05$). Farklılıkların hangi ikili gruplardan kaynaklandığını belirlemek için yapılan Mann Whitney U testleri sonucunda 9. ve 10. sınıflar arasında ($U=11516,500$; $p<0.05$) 10. sınıftaki öğrencilerin lehine, 10. ve 11. sınıflar arasında ($U=6104,500$; $p<0.05$) yine 10. sınıftaki öğrencilerin lehine anlamlı bir farklılık bulunmuştur. Duyuşsal katılım açısından 10. sınıf öğrencileri 9. ve 11. sınıf öğrencilerine göre daha fazla derse katılım gösterdiği söylenebilir. Diğer boyutlar için öğrencilerin sınıf düzeylerine göre anlamlı bir farklılık bulunmamıştır ($p>0.05$).

Tartışma, Sonuç ve Öneriler

Mesleki ve teknik liselerde öğrenim gören öğrencilerin derse katılım düzeylerini belirlemek amacıyla yapılan bu araştırmada elde edilen sonuçlar şu şekildedir.

Mesleki ve teknik liselerde öğrenim gören öğrenciler, bazen derslere katılmaktadırlar. Katılmanın alt boyutları incelendiğinde ise öğrencilerin bilişsel ve duyuşsal katılım ve davranışsal katılım-sınıf katılımı boyutlarında derse katılımları daha fazla, davranışsal katılım-uyuma/itaat boyutunda ise derse katılımları daha düşüktür. Çelik, Örenoglu-Toraman ve Çelik (2018) tarafından yapılan araştırmada, öğrencilerin derse orta düzeyde katılım gösterdikleri belirlenmiştir. Aynı araştırmada derse katılımın alt boyutlarında ise öğrencilerin davranışsal katılım-sınıf katılımında ortanın üstünde oldukları, diğer boyutlarda ise derse katılımlarının orta düzeyde olduğu belirlenmiştir. Menteş'in (2011) araştırmasında ise öğrencilerin derse katılımının yüksek olduğu sonucuna ulaşılmıştır. Sırakaya (2015) tarafından yapılan araştırmada da öğrencilerin derse katılımı oldukça yüksek bulunmuş ve yapılan araştırmada deney grubunun yer aldığı derste kullanılan materyallerin öğrencilerin derse

katılımı üzerinde herhangi bir etkiye sahip olmadığı belirlenmiştir. Erişti'nin (1998) üniversite öğrencileri ile yaptığı çalışmada ise öğrencilerin büyük bir kısmının derse katılımının orta düzeyde olduğu belirlenmiştir.

Araştırmada öğrencilerin derse katılım düzeylerinde ölçekten alınan toplam puan açısından cinsiyete göre bir farklılık olmadığı sonucuna ulaşılmıştır. Alt boyutlarda ise duyuşsal katılım ve derse katılmama boyutlarında cinsiyete göre bir farklılık olduğu tespit edilmiştir. Duyuşsal katılım boyutunda, erkek öğrenciler kadın öğrencilere göre daha fazla derse katılım göstermektedir. Derse katılmama boyutunda, kadın öğrenciler erkek öğrencilere göre daha fazla derse katılmama eğilimindedir. Erişti'nin (1998) çalışmasında da cinsiyete göre derse katılımın fark göstermediği sonucuna ulaşılmıştır. Güneri (2018) tarafından yapılan araştırmada ise öğrencilerin derse katılım düzeyleri arasında kadın öğrenciler lehine farklılık olduğu ve bu farklılığın tüm alt boyutlarda da gözlemlendiği belirlenmiştir. İki araştırma arasındaki farklılığın araştırmaya katılan okulların farklılığından (mesleki ve teknik lise- Devlet/özel anadolu lisesi) kaynaklandığı düşünülebilir. Sever, Ulubey, Toraman ve Türe'nin (2014) çalışmasında da kadın öğrencilerin derse katılım oranlarının erkek öğrencilerden daha yüksek olduğu belirlenmiştir. Derse katılımın alt boyutları açısından ise davranışsal katılım-uyma/itaat ve bilişsel katılım alt boyutlarında yine kadın öğrencilerin derse katılımlarının daha fazla olduğu sonucuna ulaşılmıştır.

Meslek lisesi öğrencilerin öğrenim gördükleri sınıf düzeyine göre derse katılımları incelendiğinde duyuşsal katılım alt boyutu açısından 10. sınıf öğrencileri 9. ve 11. sınıf öğrencilerine göre derse daha fazla katılım göstermektedir. Sınıf düzeylerine göre öğrencilerin derse katılımlarında diğer alt boyutlarda farklılık yoktur. Güneri (2018) tarafından yapılan araştırmada ise 9. sınıf öğrencilerinin 11 ve 12. sınıf öğrencilerine göre ve 10 ile 11. sınıf öğrencilerinin 12. sınıf öğrencilerine göre derse daha fazla katıldıkları sonucuna ulaşılmıştır.

Araştırmada ulaşılan sonuçlara göre genel olarak mesleki ve teknik liselerde öğrenim gören öğrencilerin derslere katılımlarını teşvik eden uygulamalara ağırlık verilmesi ve derslerin interaktif bir şekilde işlenmeye özen gösterilmesi önerilebilir. Bununla birlikte kadın öğrencilerin derslere katılımını ve özellikle duyuşsal katılımlarını arttırmak için onların ilgi ve isteklerine uygun etkinliklerin uygulanması ve öğrenme öğretme sürecinde yapılan çalışmalarda kadın öğrencilere daha fazla görev ve sorumluluk verilmesi önerilebilir. Ayrıca 9., 11. ve 12. sınıf düzeyinde öğrenim gören öğrencilerin duyuşsal katılımlarını engelleyen faktörlerin incelenmesi ve bu yönde derslerde gerekli çalışmaların yapılması önerilebilir.

Mesleki ve teknik lise öğrencilerinin derse katılım düzeylerini belirlemek amacıyla yapılan bu çalışmada öğrencilerin derse katılım düzeylerini etkileyen faktörler olarak cinsiyet ve sınıf değişkenleri ele alınmıştır. Farklı değişkenlerin de incelendiği çalışmalar yapılabilir. Bu çalışma, öğrencilerden elde edilen verilerle yürütülmüştür. Öğretmenlerden veri toplamaya yönelik çalışmalar da yapılabilir.

Metacognitive Calibration In Adaptive Learning For Management Students With Different Grades

Lin Zhao
Purdue University Northwest
lzhao@pnw.edu

Abstract

Students' judgmental accuracy in what they know plays an important role in their learning effectiveness. In this paper, we compare students' metacognition and their class performance in an introductory information systems course. Students use an interactive and adaptive learning system that delivers individualized contents based on each student's knowledge level. This system continuously monitors and assesses each student's knowledge and skills with specific learning objectives, and then identifies the areas that need to be improved. Student metacognition and performance data were collected from over 600 college students with management majors when they were using the system. The preliminary findings show that metacognitive calibration has a significant different impact on students who receive passing vs. non-passing grades. The results shed light on how students behave in a self-regulated learning environment and how instructors help students improve their metacognitive and self-monitoring skills.

Mevlana Celaleddin-İ Rumi’de Nefsin Eğitimi ve Modern İnsandaki İzdüşümleri

Prof. Dr. Dilaver GÜRER
Necmettin Erbakan Üniversitesi
Ahmet Keleşoğlu İlahiyat Fakültesi
Temel İslam Bilimleri Bölüm Başkanı
dilgurer@hotmail.com

Özet

Tasavvufî düşüncede insan iki yönlüdür; ruhsal yönüyle Tanrı’ya, nefsi yönüyle de diğer canlılara dönüktür. Bununla birlikte, insanın nefsi de, ruhu da kendine ait birtakım özellikler taşır. Ruh baştan mükemmel ve olumlu özelliklere sahip olup, nefsin tesiri altında kaldıkça olumsuz özellikler kazanabildiği, başka bir ifadeyle kirlenebildiği gibi, nefis (insan nefsi) baştan kirlî ve zayıf olup ancak birtakım metotlarla eğitildikçe ve ruhun tesiri altına girdikçe güzelleşebilir ve olumlu özellikler kazanabilir. Bu açıdan, hem ruhun saflığının korunması hem de nefsin hayvanîlikten kurtularak mükemmelleşmesi nefsin eğitime bağlıdır. Dolayısıyla tasavvufî düşüncede nefsin eğitimi son derece önemlidir, hatta tasavvufî düşüncenin baştan sona nefsi mükemmelleştirmeye dönük olduğunu söylemek yanlış olmaz. 13. Yüzyılda yaşamış olan ünlü mutasavvıf Mevlana aynı zamanda bir “nefs eğitmeni”dir. O, hem kendi nefsini eğiterek ondaki potansiyel güzellikleri ve olumlu kabiliyetleri aktif hale getirmiş, hem rehberliğini yaptığı binlerce insanı eğiterek kamil insan (perfect man) seviyesine çıkarmış, hem de insan nefsinin eğitmede genel prensipleri belirleyerek, yüzyıllar sonrasına ve günümüze ışık tutmuştur. Bugün modern psikolojide ve özellikle insanın ruhsal eğitiminde Mevlana’nın görüşlerine çok fazla müracaat edildiğini görüyoruz.

Ben tebliğimde önce tasavvufî düşüncede nefsin anlamı, yeri ve özelliklerinden bahsedeceğim. Daha sonra Mevlana’nın nefsin eğitimiyle ilgili düşüncelerine değineceğim. Son olarak da, Mevlana düşüncesinde günümüz insanını mutlu ve mükemmel yapabilmenin imkânlarını ortaya koymaya çalışacağım.

Anahtar Kelimeler: *Tasavvuf, Mevlana Celaleddin Rumi, nefis, nefis eğitimi, kamil insan.*

Modelling Of Mortality – Presentation Of Deras Software Using In Demographic Education

Petra DOTLACILOVA

Department of Mathematics University of Economics in Prague Czech Republic
petra.dotlacilova@vse.cz

Abstract

Population aging is very often discussed topic. People live until higher age. The age of living is increasing because of a few reasons. As the first one could be mentioned the increasing level of health care. The second one could be healthier life style – increasing interest of people about healthy diet, more sport, etc. Mainly these reasons caused increasing of life expectancy. On the other hand numbers of death are increasing (especially at the higher ages). That is why the reliability of demographical data is increasing at higher ages. Because of the aging population the evolution in these ages is more and more important. That is why the modelling of mortality is increasingly important. It is important to have the best imagination about the evolution of mortality at the highest ages. One of the approaches of modelling of mortality is the using of analytical functions.

The aim of this article is the presentation of selected mortality models. These models could be divided into several groups (exponential, logistic, polynomial, etc.). Gompertz law of mortality, Gompertz-Makeham function or Coale-Kisker model could be included among exponential functions. Kannisto, Thatcher or Heligman-Pollard model could be included into logistic group.

The other aim is the presentation of software DeRaS in which these models are implemented. In this article will mentioned procedure required for the calculation of mortality tables in DeRaS. The advantages of fit will be mentioned after that. Results will be presented at the end of this part. Here will be used the possible options of DeRaS software.

The data about mortality of Czech population will be used for the calculations. The data are from the Czech Statistical Office database. The data for the last disposable year will be used for the calculation (2016).

Key words: *Models of mortality, age, DeRaS software*

Introduction

The aging of population is discussed topic in last days. People live until higher ages and higher number of deaths at these ages is connected with it. So it is very important to make changes in social system and in health care system for the future. The modelling of mortality is increasingly important because of this reason.

Methodology

For the modelling of mortality could be used several approaches. One of these are the analytical functions. The functions presented in this article are using at the ages 60+.

Models Of Mortality

Gompertz function

The Gompertz law of mortality is one of the oldest models of mortality. It could be written like

$$\mu(x) = a \cdot e^{b \cdot x},$$

where x is the age, a , b are parameters of the model, $\mu(x)$ is the force of mortality (Gompertz, 1825).

The force of mortality can be roughly expressed as $\mu(x + 0,5) \doteq m_x$, where the age-specific death rate (m_x) is given as:

$$m_x = \frac{M_x}{E_x},$$

where M_x is the number of deaths at age x and E_x is the exposure to risk for x -year olds.

This model assumes exponential increase in mortality with an increasing age.

This model was improved by many authors, e.g. Gavrilov & Gavrilova (2011, 1) or Koschin (1999).

The Gompertz-Makeham function

The Gompertz law of mortality was improved by W. M. Makeham. The other parameter was included into the function. This parameter expresses deaths independent on the age (Makeham, 1860).

$$\mu(x) = c + a \cdot e^{b \cdot x},$$

where x is age, a , b and c are parameters of the model.

The Gompertz-Makeham function could be written in simpler version:

$$\mu(x) = c + a \cdot b^x,$$

where x is the age, a , b , c are parameters of model.

The Gompertz-Makeham function is very often used function for modelling of the intensity of mortality at higher ages. It almost ideally describes mortality from 60 to 85 years. But the constant increase in mortality is not true for the ages 85+. The Gompertz-Makeham function was also very important for the scientific research of Thatcher, Kannisto Vaupel (1998) or Gavrilov and Gavrilova (2011, 2).

Coale-Kisker model

Coale-Kisker model is focused on changes of deaths rates between two consecutive ages. Authors assume not constant increase at the highest ages but linear decrease. Coale and Kisker based on determination of variable k_x by Coleho, Magalhães, Bravo. This variable could be written like

$$k_x = \ln\left(\frac{m_x}{m_{x-1}}\right),$$

where m_x is the age-specific death rates.

Variable k_x is decreasing from the age 85:

$$k_x = k_{85} - (x - 85) \cdot s,$$

where x is age, k_{85} and s are parameters of the model.

This model is based on two assumptions:

1. The age-specific death rates have to be equally reliable around the age 85.
2. This assumption relates to the value of the age-specific death rate in the age considered as the highest achievable (the authors set it for 110 years). If the age-specific death rate is determined at this age then it will allow us to estimate the parameter s . The age-specific death rate at the age of 110 was set at 1.0 for males and 0.8 for females (both values are based on the level of death rates in the Swedish population).

The final model then corresponds to an exponential-quadratic function. It could be expressed as

$$\mu(x) = e^{a \cdot x^2 + b \cdot x + c},$$

where x is age, a , b and c are unknown parameters (Thatcher et al., 1998).

The model of Coale and Kisker was further dealt with by Thatcher, Kannisto and Vaupel (1998) or Burcin, Tesárková and Šídlo (2010).

Heligman and Pollard model

The original form of the model was focused on modeling of mortality throughout the whole age range:

$$q_x = A^{(x+B)^C} + D \cdot e^{-E \cdot (\ln(x) - \ln(F))^2} + \frac{G \cdot H^x}{1 + G \cdot H^x},$$

where x is age, A , B , C , D , E , F , G and H are unknown parameters.

The model tries to eliminate the dearth of all other models which model mortality only at higher ages. The aim of the authors was to create a model that would be appropriate to capture mortality even in the lower age (Boleslawski, Tabeau, 2001).

Since the other models deal with modeling of the intensity of mortality only for older people, I will only consider the third part of the original eight-parameter version of the model.

The model of Heligman and Pollard is shaped as follows:

$$q_x = \frac{G \cdot H^x}{1 + G \cdot H^x},$$

where x is the age, G and H are unknown parameters.

Therefore, the same function is used as in the Himes-Preston-Condran model. The difference, however, is that the model of Heligman and Pollard models the probability of dying rather than age-specific death rates.

One of the first logistics models was designed by Perks in 1932. Perks first noted that mortality rates can be

described by a curve - a logistic function.

Kannisto model

Another logistic model is the Kannisto model. Kannisto found that mortality rates in modern populations are very close to one of the simplest forms of a logistic function in which logit (μ_x) can be expressed as a linear function of the age. The same model function was used by Himes, Preston and Condran in 1994.

$$\mu_x = \frac{a \cdot e^{b \cdot x}}{1 + a \cdot e^{b \cdot x}},$$

where x is the age, a , b are unknown parameters.

Logit (μ_x) is a linear function of age written in the form:

$$\text{logit}(\mu_x) = \ln(a) + b \cdot x$$

Thatcher model

Another form of the logistics model was introduced by Thatcher. It differs from the basic logistic function by including the other parameter (characterizing age-independent mortality).

$$\mu_x = c + \frac{a \cdot e^{b \cdot x}}{1 + a \cdot e^{b \cdot x}},$$

where x is the age, a , b and c are unknown parameters (Thatcher, 1999).

As was mentioned above, a number of authors have used the logistic function for modeling mortality. Later they were followed by another Canudas-Romo (2008).

Software Deras

DeRaS (see Figure 1) has been designed for modelling of mortality using the above-mentioned models. Before computing, you first need to insert an Input File and choose where we want to store outputs (Output Directory). Finally, we set a calculation period - the mortality tables can be calculated for several years to determine the time series.

The software also offers a choice of age range in which the model parameters will be estimated (minimum output age and maximum output age). Finally, you need to set the maximum output age (the age until which mortality tables are counted).

In the next step, we can choose which analytic functions will be used to calculate mortality tables. DeRaS also offers a choice between full and abridged mortality tables.

A great advantage is the creation of figures. DeRaS offers a figure for the probability of dying, life expectancy, etc. For the probability of dying, it is possible to create a combined figure that compares all models.

Sample of DeRaS Software Environment:

Figure 1: Enviroment of DeRaS software

Source: DeRaS (2012)

For the estimation of unknown parameters is used nonlinear regression procedure.

Results

For the calculations was used the data about mortality of the Czech population for the last available year (i.e. 2016). As the input data was used the number of deaths according age and gender, the number of mid-year population according age and gender, and the number of live births sorted by gender.

For the demonstration of the output is used a combined figure for probability of death.

The figure (Figure 2) shows modeling probabilities of dying for the Czech males according to every single model. The figure also contains empirical probability of death. The results show that the highest values are given by Coale - Kisker and Gompertz - Makeham model. On the other hand, the lowest values we obtain for the Kannisto and Thatcher model.

Figure 2: Probability of death according to selected models – males in the Czech Republic

Source: data CZSO, author's calculation (DeRaS, 2012)

The following figure (Figure 3) contains modeling probabilities of dying for the Czech females. Based on the obtained results, it can be said that the highest values are provided by the Coale-Kisker model, the lowest values are provided by Kannisto and Thatcher model. And as the average model can be classified the Heligman-Pollard model.

Figure 3 Probability of death according to selected models – females in the Czech Republic

Source: data CZSO, author's calculation (DeRaS, 2012)

Conclusion

One of the aims of this article was modelling of mortality in at ages 60+ by using selected analytical functions. Based on the obtained results, we can conclude that the highest values for probability of dying are achieved by using the Coale-Kisker model or the Gompertz-Makeham function. On the other hand, we get the lowest values for the Thatcher or Kannisto model. Among the average models we can include the Heligman-Pollard model. Another aim was to introduce the DeRaS software in which these models are implemented. Its advantage is the speed of getting the outputs. Several functions can be used to model of mortality, and it is possible to determine the age range to be used for the estimation of parameters. The software also offers graphical outputs and a choice between full and abridges mortality tables.

Abstract

This study aims to investigate a sound model by comparing the unidimensional, multidimensional, and multi-dimensional item bundles models. Answering the open-ended question is one of the most important tasks for assessing the product and process of mathematical problem solving through the use of multiple proficiencies. Its use may cause a violation of item local independence due to its being multiple scores from a common open-ended task on multiple proficiencies. The instrument involves seven tasks encompassing three item bundles that share a common open-ended question for Thai sixth-grade students. The results show that all multi-dimensional models fit better than the unidimensional model. Although the bundles model is the best fit, the two multidimensional models have very similar values in terms of their reliabilities, correlations, and weighted fit statistics. In a real-world context, the multidimensional model is an adequate simpler explanation and, at an international level, provides richer information to the classroom teacher. Further analysis focused on the appropriate amount and the types of common tasks for using the item bundles model and demonstrate the magnitude of the bundle effect that impacts parameter estimates and test precision.

Keywords: *Assessment design; MRCML model; multidimensional proficiencies; problem solving; Rasch analysis*

Introduction

Assessing mathematical problem solving (MPS) is one of the most interesting issues because it significantly contributes to the outcomes of mathematics education (National Council of Teachers of Mathematics (NCTM), 2000). In recent years, 'embedded assessment' has been a major topic of interest, debate, and experimentation in the nationwide efforts at educational reform in each country (Hickendorff, 2013; Jones, Swan, & Pollitt, 2014), particularly in mathematics (Arieli-Attali & Cayton-Hodges, 2014; Stylianou, 2013). Assessing MPS focuses not only on the product of teaching but also on the process of thinking. Therefore, by answering the open-ended question is the most efficient task for eliciting the multiple proficiencies of the students because they need to use their responses to the previous step to solve problems in the subsequent step before obtaining the final answer.

Past researchers Hickendorff (2013), Jones et al. (2014), and Youngchim, Pasiphol, and Sujiva (2015) revealed that the strength of using the multidimensional approach to examine and develop problem solving tasks and cognitive processes but they only emphasize formal test administration rather than the embedded assessment in the curriculum. Besides, past studies focus on students' profiles based on the differences in the dimensions rather than the levels of proficiency, reflecting on students' progress in each dimension (i.e. progress variables), which is a major focus of instruction and assessment activities (Black, Wilson, & Yao, 2011). It is important to note that the tasks are not designed to provide information on the separate dimensions, particularly when items require multiple latent traits within one single task.

The aim of this study is to investigate a sound model for assessing MPS relating to the modeling of items in a common open-ended question by comparing three models namely unidimensional (UD), multidimensional (MD), and multidimensional item bundles (MDB) models. The results of this study are important because they provide evidence for selecting the model with the flexibility and appropriateness for assessment in the real-world context. The idea that students can obtain the right answer for wrong reasons needs to be taken into account when developing assessment tools.

Modelling Of Items In The Common Open-Ended Question

According to Webb (1998), developing a task requires identifying the specific assessment objectives, revealing the extent to which a student possesses knowledge of the idea being assessed, and disclosing how students have integrated their knowledge of this idea into other ideas or contexts. Therefore, the tasks for assessing MPS frequently require a number of cycles for piloting and revising the questions particularly true for open-response questions in which students are asked to generate and write more than one way of stating the answer and for higher order thinking, eliciting the knowledge to be assessed, and revealing something of the process of MPS through the use of three dimensions namely procedures (PC), strategies (ST), and reasoning (RE). Researchers compared the three models of item modeling namely UD, MD, and MBD models. Although the three models are related to a common open-ended question or a common prompt, the measurement models are different for the design matrices specifying the relationship between the response to the items and the structural parameters assumed to underlie a given measurement situation.

In the UD, the sum of scores received from 14 items, ranging from 0-56 can be treated as the student's response for a single estimate of MPS (see Figure 1). It has the advantage of parsimony in modeling student proficiency and summarizing student's MPS with a single number, which represents the performance on the 14 items. The probability of a student's response is in category k of item i (P_{ik}), as opposed to the previous category $k-1$ (P_{ik-1}), for each of the 14 items depicted in Equation 1. This equation is related to the level of that student's ability on unidimension (θ) and the relative difficulty of categories k (δ_{ik}) for disclosing the level of MPS.

$$\log(P_{ik}/P_{ik-1}) = \theta - \delta_{ik} \quad (1)$$

Analyzing the data compositely with the ACER ConQuest Version 2.0 (Wu, Adams, Wilson, & Haldane, 2007) produces estimates for a total of fifty-seven parameters: fifty-six item (δ) and step (τ) difficulties, and one population variance. In the analysis, we constrain the population mean to zero so that all item parameters can be estimated while ensuring parameter identification.

Figure 1: Unidimensional model

The MD can be viewed as a compromise between the UD and consecutive models that incorporate the best of both approaches (Allen & Wilson, 2006; Briggs & Wilson, 2003). The UD composites the scores with the single variable, and the consecutive approach summarizes the scores on items associated with each of the three MPS variables namely PC, ST, and RE (see Figure 2). The scores on each dimension provide distinct information about each examinee by incorporating the correlation between the dimensions directly into the model. There is a direct influence of the latent MPS for each dimension on the items assigned to the dimension depicted through the straight arrows but there is also an influence from all the other dimensions through the curved lines. The curved lines are represented associations rather than causes.

Figure 2: Multidimensional model

This model can be modeled using the Multidimensional Random Coefficient Multinomial Logit (MRCML) model

to estimate latent MPS across the three dimensions simultaneously. The MD uses the formulation from Equation 2 (compare with Equation 1):

$$\log(P_{ik}/P_{ik-1}) = \theta_d - \delta_{ik} \quad (2)$$

The major difference between Equations 1 and 2 is that, here, the person estimate, θ_d , is now also subscripted by the dimension, d. The multiple d values allow the researcher to model examinees' level of MPS on each of the separate dimensions represented in the scale. There are now three population means for this analysis (constrained to zero for identification), three variance estimates and six covariance estimates. Altogether, a total of sixty-two parameters are estimated using ConQuest.

Rosendaum (1988) introduces the term 'item bundle' to denote precisely the type of item subset and drawing attention to the possibility of generalizing the concept of conditional independence so that it would allow tests composed of item bundles to be calibrated in ways similar to tests that adhere to the usual formulation of conditional independence. In the case of the strict bundle independence model, that is, a model without parametric dependence between bundles (B), then the maximum number of parameters that can be estimated for each bundle (B1, B2, B3) is the $M^R - 1 = 5^3 - 1 = 124$ response pattern, where M is the number of item categories and R is the number of item bundles (see Figure 3). The MDB model uses the formulation from Equation 3 (compare with Equations 1 and 2):

$$\log(P_{ck}/P_{ck-1}) = \theta_d r_c - \delta_{ck} \quad (3)$$

The probability of a student's response is in category k of bundle c (P_{ck}), as opposed to the previous category ck-1 (P_{ck-1}), for each items bundle. This equation is related to the level of the student's ability on each dimension (θ_d) and the relative difficulty of categories k (δ_{ck}) to bundle c with the level of MPS. In addition, this model adds the score of each category on bundle c (r_c) for this study.

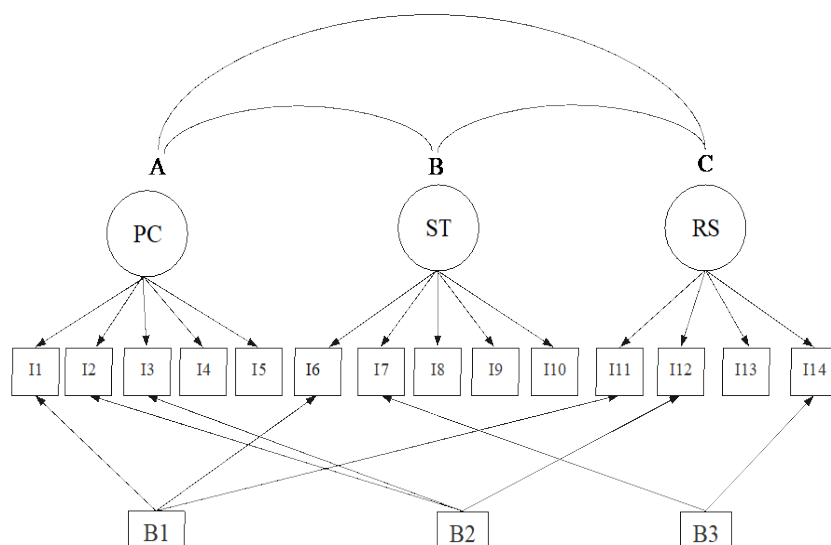

Figure 3: Multidimensional item bundles model

Methodology

The construct modeling approach is an example of an assessment system called the Berkeley Evaluation and Assessment Research (BEAR) Assessment System, which is largely based on performance assessment particularly on assessment that are embedded in the pedagogy and curriculum rather than administered as formal 'tests'. This approach is based on the ideas of developmental assessment (Wilson, 2005). The elements of the system are based on four principles, namely (i) construct maps (a developmental perspective on student learning); (ii) design of tasks (a match between instruction and assessment); (iii) outcome space (teacher management and responsibility), and (iv) measurement model / Wright map (generating quality evidence) described in detail by Wilson and Sloane (2000).

The PC construct map represents the degree to which a student selects an appropriate solution and obtain the correct answers. This construct map contains five levels of the learning progression to capture student successes in four operations of whole numbers, addition, subtraction, multiplication, and division. It describes the development of mathematical procedures as progressing from exploring inappropriate solutions and obtaining the wrong answers to show an appropriate solution and operation without error. The ST construct map captures students' ability to choose and use strategies for representing the algorithm and notation with reflection for familiar or unfamiliar problems. The expectation at higher level is that students can demonstrate the ability to move from concrete to abstract representations such as drawing a diagram, guessing, checking, and improving a solution,

making an organized list, making a table, working backwards, using logical reasoning, looking for a pattern, and/or using a model. The RE construct map examines the quality of the student's demonstration of logical reasoning with strong explanations that include both clear text and proper mathematical notation.

The design of tasks is focused on the number and operation involved in solving the four fundamental mathematical operations of cardinal number prompts. All the MPS items are created based on the desired performance of the Basic Education Core Curriculum of Thailand, Ministry of Education (2008) for Thai sixth-grade students. The learning standards consist of (i) an understanding of diverse methods of presenting numbers and their application in real life; (ii) an understanding of the results of operations of numbers, the relationship of operations, and the application of operations for problem solving; (iii) the use of estimation in calculation and problem solving, and (iv) an understanding of the numerical system and the application of numerical properties.

The outcome space is one scoring guide for each of the three MPS variables based on the student's level of proficiency on an assessment task is determined. The guide is used throughout the entire class for all assessments relating to a particular dimension. The definition of PC, ST, and RE are contained in the scoring guides, which describe the thinking process needed to reach the various scoring levels ranged from 0 to 4 on the elements of the variables (see Figure 4).

Score	Uniform Level	Procedures (PR)	Strategies (ST)	Reasoning (RE)
4	proficiency is above and beyond what is asked of the student	<ul style="list-style-type: none"> -Systematically explore a problem to gain an understanding of how relevant information to make structure and conjectures. - Use of procedures and operations without arithmetic/solution errors in multiple-step. -Show an appropriate solution and get the correct answers. 	<ul style="list-style-type: none"> -Use the multiple strategies to understand all information pertained to the problem. -Choose and use the multiple strategies representing the complex algorithm or procedures, such as drawing a diagram, guessing and improving, making an organized list, making a table, working backwards, using logical reasoning, looking for a pattern, or/and using a model. -Demonstrate the ability to move from concrete to abstract representations. 	<ul style="list-style-type: none"> -Makes predictions and justifications using information from their work effectively, accurately, and thoroughly. -Make a reasonable estimate and evaluate reasonableness of solutions, analysing the effect of the use each, and how they relate to each other -Be able to use deductive arguments to justify decisions and may result in formal proofs. -Demonstrates logical reasoning with strong explanations that include both words and proper mathematical notation.
3	proficiency is mostly complete and appropriate performance	<ul style="list-style-type: none"> -Solve a one-step and two-step solutions correctly but they will not complete all the steps. -Mostly explore a problem by using procedures and operations appropriately. - Show an appropriate procedures and operations but may still get incorrect answers because of miscalculations or misconception in the minor part of the notation. 	<ul style="list-style-type: none"> -Use a variety of strategies for representing algorithm or procedures appropriately and systematically with the major part of mathematical basis. -Use both words and proper mathematical notation for explanation, such as drawing the pictures, making a guess and test it, or/and eliminating possibilities, etc. 	<ul style="list-style-type: none"> -Construct argument with an adequate mathematical basis. -Demonstrates logical reasoning with appropriate explanations that include both words and proper mathematical notation. -Mostly make predictions and justifications effectively and accurately by using information from their work. -May show inappropriate predictions and justifications in the minor part of the problem.

Figure 4: The MPS scoring guide in each dimension

The measurement model used is the Multidimensional Random Coefficients Multinomial Logit Model (MRCLM) by Adams, Wilson, and Wang (1997). MRCLM is a general and flexible model that allows for the specification of a large number of multidimensional item response models (Draney, Yamada, & Xie, 2000). The MRCLM describes the proficiency of person N as a V -dimensional vector $\theta = (\theta_1, \dots, \theta_V)$. The relationship between items and dimensions is specified by a scoring function, such that a response in category j to item i is represented by a V column vector of length V $\mathbf{b}_{ik} = (b_{ik1}, \dots, b_{ikV})'$. These column vectors are then collected into a scoring submatrix \mathbf{B}_i for item i , and these submatrices are collected into an overall scoring matrix \mathbf{B} . There are p item parameters, which are collected into a parameter vector $\xi = (\xi_1, \dots, \xi_p)$. The relationship between item responses and parameters is specified by a design matrix \mathbf{A} . This matrix is composed of design vectors \mathbf{a}_{ij} , each of length p , which, when multiplied by the parameter vector ξ , form a linear combination of the parameters operative for response j to item i . The probability of a response j to item i is then given by

$$P(X_{ij} = 1 | A, B, \xi | \theta) = \frac{\exp(b_{ij}\theta + a'_{ij}\xi)}{\sum_{k=1}^J \exp(b_{ik}\theta + a'_{ik}\xi)} \quad (4)$$

Data was collected from 409 Thai sixth-grade students in seven elementary schools in the northern and north-eastern regions of Thailand. This study employs four measurement models to investigate a sound model for assessing MPS relating to the modeling of items in the common open-ended question. These models consist of the Rasch model (Rasch, 1960), the partial credit model (Masters, 1982), Rasch models for item bundles (Wilson & Adams, 1995), and the MRCLM (Adams et al., 1997). The parameter are estimated using ACER ConQuest Version 2.0 (Wu et al., 2007). The model fit, reliability and item fit comparisons provide the evidence for selecting the model with the flexibility and appropriateness for assessment in a real-world context.

Results

Model fit and reliability comparisons

The fits of the various models are compared considering the difference in deviance between the two models. The resulting statistic is distributed as approximately the χ^2 , with degrees of freedom equal to the difference in the number of parameters in the two models. The information about the fit of the various models indicates that the MDB model fits the data significantly better than the two models at the $\alpha = .01$ level (see Table 1). Based on a comparison of Akaike's Information Criterion (Akaike, 1981), the MBD fits the data better than the MD and UD. Comparing the UD and MD models, however, the MD shows a fit that is significantly better at the $\alpha = .01$ level than the UD model ($\chi^2=63.826$, $df=5$). This result is at least suggestive that the MD is better than the UD model for these data. Regarding the reliabilities of the three models in the MPS data, under the MD model, the reliability for each dimension comes closer to the unidimensional reliability estimate than the MDB model, particularly the ST dimension. This result suggests that the MD model results in a higher reliability than the MDB model for these data. Nevertheless, in the case of the PC dimension in each model, the reliability is lower than the other two MPS variables. Moreover, in a bundle saturated model, the plain multidimensional model likely over-estimated the reliability (Wilson & Adam, 1995). The correlation between dimensions for each of the three models, in all three models, the correlations are high between dimensions are high, especially the correlation between the ST and RE. The correlations are very similar for both models.

Table 1. Model Fit Comparison, Reliability, and Correlation Estimates between Dimensions

Model Fit Comparison	AIC	Deviance	Number of parameters
1. UD	11726.257	11612.257	57
2. MD	11672.432	11548.432	62
3. MBD	11508.025	11378.025	65
Reliability	PC	ST	RE
1. UD		0.803 (all items)	
2. MD	0.710	0.710	0.710
3. MBD	0.677	0.677	0.677

Correlation Estimates between Dimensions		PC	ST
1. MD	ST	0.861	
	RE	0.874	0.887
2. MBD	ST	0.871	
	RE	0.875	0.895

Construct validity, Wright map comparisons

The person ability estimates and the item difficulty estimates from the MRCLM analysis can be summarized graphically using a Wright Map (Wilson, 2005). The results found that the Wright Map of the MD, and MDB models are very similar in the person ability estimates and the item difficulty estimates. Consequently, researchers decided to present the comparison between unidimensional and multidimensional constructs (see Figure 5). The Wright Map of unidimensional construct demonstrates that most items are generally inconsistent, particularly for some noticeable overlap in the levels and some surprisingly low threshold values in level 5. Specifically, Item 1, 3, 4, and 5 have threshold estimates in level 5 that are easier than expected. The Wright Map displays the thresholds for each item step of the MD model that have been separated into dimensions such as PC, ST and RE. The Wright Map shows that most of all are generally consistent in this regard, except for some noticeable overlap in the levels and some surprisingly low threshold values in level 4 and 5 in PC dimension. Specifically, the PC (Item 2, 4, and 5) items have threshold estimates in level 5 that are easier than expected.

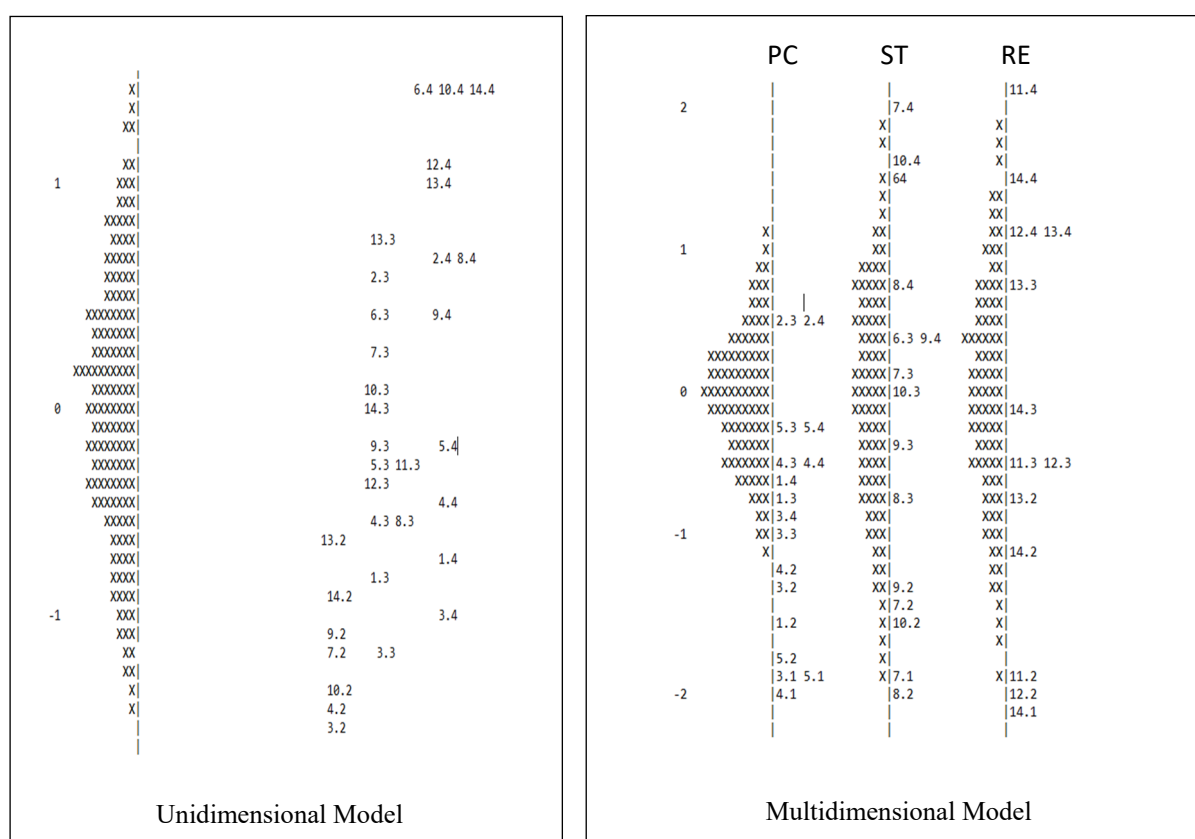

Figure 5: Wright Map Comparison between unidimensional and multidimensional models

Item fit

Regarding the weighted mean square fit statistics of the items for the three models, three out of the 14 items in the UD construct, i.e., Items 2, 5, and 13, have a weighted mean square fit statistic that falls outside the range of the 95% confidence interval (see Table 2). Out of these three items that have a significant misfit, there is one item (Item 5) that falls outside of the acceptable effect size range of 0.75 to 1.33. Considering the item fit of the other two models, however, only one or two of the 14 items in the two multidimensional models have a weighted mean square fit statistic that falls outside the range of the 95% confidence interval, and they are all from the original subset of three. Out of these items that have a significant misfit, all the items fall within the acceptable effect size range. This result is at least suggestive that the fit of the items of the MD construct is better than that of the UD construct for these data.

Table 2. Weighted Fit Statistics for the Fourteen Estimated Item Parameters of the Three Models

Dimension	Item	UD			MD			MBD		
		MNSQ	CI	T	MNSQ	CI	T	MNSQ	CI	T
PC	1	1.13 (0.83, 1.17)		1.5	0.99 (0.83, 1.17)		-0.1	0.92 (0.82, 1.18)		-0.9
	2	0.87 (0.88, 1.12)		-2.1	0.87 (0.89, 1.11)		-2.4	0.91 (0.87, 1.13)		-1.5
	3	1.07 (0.76, 1.24)		0.6	0.95 (0.76, 1.24)		-0.4	0.86 (0.76, 1.24)		-1.1
	4	1.07 (0.85, 1.15)		0.9	0.97 (0.85, 1.15)		-0.4	0.94 (0.85, 1.15)		-0.7
	5	1.51 (0.87, 1.13)		6.7	1.28 (0.88, 1.12)		4.1	1.29 (0.87, 1.13)		4.1
ST	6	0.97 (0.87, 1.13)		-0.4	1.06 (0.86, 1.14)		0.8	1.01 (0.86, 1.14)		0.1
	7	0.91 (0.84, 1.16)		-1.1	0.99 (0.85, 1.15)		-0.1	1.03 (0.84, 1.16)		0.4
	8	0.90 (0.87, 1.13)		-1.5	0.99 (0.86, 1.14)		-0.1	0.98 (0.86, 1.14)		-0.2
	9	0.88 (0.88, 1.12)		-2.0	0.96 (0.87, 1.13)		-0.6	0.98 (0.86, 1.14)		-0.3
RE	10	0.96 (0.87, 1.13)		-0.5	1.01 (0.87, 1.13)		0.2	1.01 (0.87, 1.13)		0.1
	11	1.01 (0.84, 1.16)		0.2	1.07 (0.85, 1.15)		0.9	1.11 (0.85, 1.15)		1.4
	12	0.99 (0.86, 1.14)		-0.1	1.05 (0.86, 1.14)		0.7	1.06 (0.86, 1.14)		0.8
	13	0.86 (0.87, 1.13)		-2.3	0.96 (0.86, 1.14)		-0.6	0.97 (0.86, 1.14)		-0.4
	14	0.90 (0.87, 1.13)		-1.5	0.96 (0.87, 1.13)		-0.6	0.99 (0.86, 1.14)		-0.1

Discussion and Conclusion

Results indicated an evidence that a three-dimensional model is more appropriate than a one-dimensional model. The unidimensional and multidimensional models ignore the violation of the local independence assumption. Thus, the item bundles model is the best fit for these data because this model is concerned with the violation of item local independence in cases in which students obtain several scores from a common open-ended question or task, and it does so by means of formulations that meet the independence requirement between the bundles rather than between individual items. Most importantly, researchers that the MD model is highly problematic concerning the high correlation between dimensions because it obtained several scores from a single student written response on multiple dimensions. Furthermore, results have shown that ignoring local dependence will, in general, overestimate the test information and reliability and thus underestimate the standard error of ability estimates. The resulting parameters must be interpreted with respect to the item bundle, rather than in terms of individual items (Wang, Su, and Qiu, 2014). Nevertheless, in this case, one aspect, a contrasting assumption, is that the correlations are very similar for both models. Moreover, the MDB model shows a fairly higher correlation matrix than the MD model. These results indicate that the assessment design can use the simple multidimensional model for representing a complicated model, such as those described by Wilson and Adams (1995) and Arnesona (2015), in which the saturated bundle model is not a feasible strategy to use for assessing polytomous items.

In conclusion, the results of the two multidimensional models have very similar values in terms of the reliabilities (EAP) and correlation matrix, especially the weighted fit statistics. Regarding its use in the real-world situation, the MD model is a more adequate explanation than the explicit MDB models. At an interpretative level, the MD provides richer information to the classroom teacher about the MPS of students than the UD model. However, the correlations between the ST and RE competencies are closely related. The ST construct levels capture students' ability to choose and use strategies for representing the algorithm and notation that reflects familiar or unfamiliar problems, whereas the RE construct levels focuses on the quality of students' demonstration of logical reasoning with strong explanations that include both clear text and proper mathematical notation. The scoring of these dimensions is not clear and explicit in some open-ended tasks. In some situations, using logical reasoning is the best strategy of all for meeting higher-level expectations. Students can demonstrate the ability to move from concrete to abstract representation. Future research is necessary to examine and compare the fit of the model after reducing the number of dimensions assessed by combining the ST and RE. Moreover, this study did not investigate the amount and types of items in the common open-ended questions with appropriation for using the item bundles model. Further analyses should demonstrated the magnitude of the bundle effect that impacts the parameter estimates and test precision.

Özet

Bu araştırmada ateistlerin neden inanmamayı tercih ettiği problemine cevap aranmaktadır. Nitel bir desene sahip olan bu çalışmada literatür taraması yapılmıştır. Veriler deskriptif analiz tekniği ile çözümlenmiş, anlayıcı geleneğe bağlı olarak yorumlanmıştır. Elde edilen sonuçlara göre ateistlerin Tanrıyı reddetmesinde *psikolojik*, *sosyokültürel*, *ekonomik* ve *bilimsel* nedenler merkezi öneme sahiptir. Bu bağlamda “bağımsızlık ve özgürlük tutkusu”, “Tanrı’nın kötü bir varlık olarak algılanması”, “teodise problemi”, “anlam arayışı”, “rasyonel düşünce”, “bilim ve teknolojiadaki gelişmeler”, “liberal ekonomi”, “modernitenin dolaylı etkileri” ve “dünyevileşme” faktörlerinin ön plana çıktığını görmekteyiz.

Anahtar Kelimeler: *Ateizm, inançsızlık, kötülük problemi, sekülerleşme*

Giriş

İnanç gibi inançsızlık da tarihin ilk dönemlerinden beri mevcuttur. Gerçi inançlıların bir topluluk haline geldiği inançsızların ise sosyal bir yapı oluşturamadığı, daha ziyade ferdi bir görünüm arz ettiği sıklıkla iddia edilmektedir (Bergson, 1986). Kanaatimizce geleneksel toplumlar da daha bireysel bir tutum halinde tezahür eden ateizm modern ve postmodern sosyal yapılarda örgütlenmeye ve grup oluşturmaya başlamıştır. Günümüzde hem Türkiye’de hem de Avrupa ve ABD’de ateist dernekleri kurulduğunu görmekteyiz. Bu derneklere üye olanların sayısı da her geçen gün artmaktadır.

Bu araştırmada “ateistler neden inançsızlığı tercih etmektedirler?” sorusuna cevap aranmaktadır. Betimleyici bir özellik arz eden bu çalışma nitel bir desene sahiptir. Literatür taraması ile elde edilen bulgular hermenötik çözümlemeyle tahlil edilmiştir. Amacımız ateistlerin psikolojik özelliklerini incelemek, ateizmin arka planlarını anlamak ve literatüre katkı sağlamaktır.

Ateizme Yaklaşımlar

Ateizm, “Tanrı fikrine ve inancına sahip olmama”, “Tanrı’nın varlığını reddetme” ve “Tanrı’yı yaşama dâhil etmeme” yahut “yaşamdan uzak tutma” şeklinde tanımlanabilir (Topaloğlu, 2001). Evrenin ve var oluşun Tanrı’yla açıklanmasının yanlış, hatta anlamsız olduğunu iddia eden (Öğcem, 2013) bu düşünce tarzı dinî bakımdan mutlak inançsızlığı temel almaktadır. Ateizm temelde bir bilinçlilik hali olduğu söylenmektedir. Bunu kanıksanmış yanlışların sorgulanarak terk edilmesinin bilinci olarak ele almak da mümkündür (Bakış, 2008). Bu açıklamaya dikkat edilecek olursa dinî iman ve inancın şuurlu bir biçimde tenkidi ve reddedilmesi söz konusudur. Bununla birlikte şu hususu özellikle belirtmek gerekir ki ateistler ateizmi sadece Tanrı’nın inkâr edilmesi olarak değerlendirmemektedir. Onlara göre dinî inancın reddini içeren ateizm insanın varoluşsal problemlerine cevap sunan, bireyin özgürlük mücadelesine başlatan ve kişinin kendini yakalayabilmesine fırsat veren mücadeleci bir tutumdur. Bu nedenle ateizmin etki ve sonuçları itibarıyla insan hürriyetini savunan bir yaklaşım olduğu iddia edilmiştir. Ateistlerin Hristiyanlık ve İslam başta olmak üzere kurumsal dine ve teizme kesin bir itiraz ile ortaya çıkmasını bu kapsamda değerlendirmek mümkündür (Girardi, 2005). Bununla birlikte inancın olmadığı yerde inançsızlıktan bahsedilemeyeceğini söylemek durumundayız. Dolayısıyla teistik inanca bir tepki olarak ortaya çıkan ateistik düşüncenin, kendini tanımlarken büyük ölçüde Tanrı inancı ve ilahi dinlerin neligi ve nasılığı üzerinden yürüdüğüne altını çizmek gerekir (Topaloğlu, 2001). Ayrıca ateistlerin sadece Tanrı’yı reddetmekle kalmadığı, bununla birlikte onların “vahiy”, “peygamberlik”, “kutsal kitap”, “mucize” ve “ahiret inancı” gibi dini kabulleri de reddettiği görülmektedir. Dahası ateistlerin sadece teistik inançları değil pagan inanışları, mitik ve antropomorfik Tanrıları, her türlü metafizik anlayışı, Budizm ve Hinduizmin transandantal Tanrı tasavvurlarını, hatta panteizm ve deizm gibi inanışları da dışladığını görmek mümkündür (Topaloğlu, 1996; Gülfil; 2018).

Kuşkusuz kavram ve olgu olarak ateizm tarihsel süreçte yeni anlam ve tanımlar kazanmıştır. Bundan dolayı klasik ateizmle modern ateizmin farklı ele alınmaktadır. Modern ateizmde Tanrı lüzumsuz ve boş bir kavrama dönüştürülmüştür (Hyman, 2010).

Bugün yapılan araştırmalar ateizmin şekil, yöntem, gerekçe ve amaç bakımından birbirinden farklılaştığını ortaya koymaktadır. Tanrı tanımazlığın tek çeşit olmadığı “mutlak”, “teorik”, “pratik”, “ideolojik-materyalist” ve “ilgisizlerin ateizmi” olmak üzere beş çeşide ayrıldığı görülmektedir. *Mutlak ateizm*, *pozitif* ve *negatif*, *pratik ateizm* ise, *pasif* ve *aktif* olmak üzere kendi içerisinde iki türe ayrılmaktadır (Ergezen, 2004; Sevinç, 2016; Topaloğlu, 2001; Gülfil, 2018)

Ateist Kime Denir?

Ateist kime olduğunu ve onun hangi özellikleri taşıdığını cevaplamak oldukça zordur. Zira ister iç grup ister dış grup üzerinden tanımlansın *ateist* şeklinde kavramlaştırılan kişiler birbirinden oldukça farklı bir karakter arz etmektedir.

Kuşkusuz ateist kelimesi, özünde Tanrı’yı reddeden kişi anlamında kullanılmaktadır. Bu haliyle oldukça açık ve kesin bir tanımlama söz konusudur. Ancak az ya da çok yahut flu bir tarzda Tanrı inancına sahip olduğu halde kendisini ateist olarak niteleyen kişiler mevcuttur. Bu durumda “ateist kime denir?” sorusu oldukça çetrefilli bir konum kazanmaktadır (Topaloğlu, 2001).

Ateist sözcüğü tarihsel süreç içerisinde değerlendirildiğinde, onun her dönemin düşünsel, felsefi, siyasi ve ideolojik görünümüne uygun olarak yeni bir ruha büründüğü söylenebilir (Hyman, 2010). Örneğin antik çağda, ateist kelimesi yalnızca inançsızlığı dile getirmeye cesaret eden marjinal kişiler olarak ifade edilirken (Girardi, 2005), 1540-1630 yıllarında, Tanrı dünyaya görüşünün belirli ana öğretilerini sorgulayan ya da inkâr eden metafizik inanç koşullanmalarını reddeden; tüm ruhani varlıkları ve olayları kabullenmeyen kişi olarak tanımlanmıştır. 1630 yıllarından günümüze kadar uzanan değişim süreci içerisinde ateistler, kilisenin kâfirleri kurallara karşı çıkan kimseler olarak ifade edilmektedir. Fakat çok geçmeden anlaşmazlık Tanrının varlığı konusunda ortaya çıkmıştır. Daha sonra ateistlerin; sefiherler, âlimler ve şüphecilerden meydana gelen gruplar haline geldiği görülmektedir (Hyman, 2010; Gülfil, 2018).

19. yüzyıla gelindiğinde Marx “ateist” kelimesini, özünün toplumda emek aracılığıyla şekilleneceğine inanan kişi olarak tanımlamıştır (Özkan, 2009). Feuerbach’ın antropolojik ateizmine göre ateist, kendi varlığını idrak edip benliğini kabul eden; Tanrının sıfatlarının aslında kendi sıfatları olduğunun farkına varan ve özüne yabancılaşmayan kişidir (Akdemir, 2003). Bugün ise, ateistlerin kendilerini tanımlama konusunda ateist kelimesini saygın bir terim haline getirme çabası içine girdiklerini görmekteyiz. Örneğin Jacob Holyoake kendini tanımlarken ateist yerine “sekülerist” kavramını tercih etmektedir (Hyman, 2010; Gülfil, 2018). Görüleceği üzere ateist sözcüğü dinde, sanatta, bilimde ve felsefede tanrı tanımaz şeklinde ortak bir alanda kullanılsa da, konuyu biraz değince her bilim dalında ona farklı anlamlar yüklediğini görmekteyiz.

Ateistlerin Tanrı’yi Reddetme Gerekçeleri

Ateistlerin Tanrı’yi reddetmelerinin arkasında psikolojik, sosyolojik, sosyal psikolojik, ekonomik ve bilimsel gerekçeler olabilir. Bunlarla birlikte özellikle zamanın ruhu ve yeni insan tipini hasseten anmak gerekir.

İlgili literatür incelendiğinde görülecektir ki özellikle günümüz ateistlerin Tanrı’yi reddetmesinin arkasında sekiz farklı neden mevcuttur:

- Bağımsızlık ve özgürlük arzusu:** Bağımsızlık ve özgürlük duygusu inançsızlığı tercih etmede en güçlü psikolojik güdü olarak karşımıza çıkmaktadır. Bu duyguyu besleyen farklı psikolojik faktörden bahsedilebilir “Kendine yeterlilik”, “güç elde etme arzusu”, “aşırı bireyleşme”, “egozim”, “hazcılık” ve “narsizm” bağımsızlık ve özgürlük arzusunu sürekli beslemektedir (Bauman, 1998; Vergote, 1966; 1983; Hökelekli, 2005; Ashford, 2009; Özkan, 2009; Gülfil, 2018)
- Tanrı kavramına yüklenen olumsuz anlamlar:** Ateistler Tanrı denince olumsuz bir varlık tasavvur etmektedirler. Bu noktada olumsuz da olsa ateistlerin zihninde bir tanrı şeması olduğunu söylemek mümkündür. Onlarda olumsuz Tanrı şemasının oluşumunda dramatik ve travmatik tecrübeler, kötülük problemi ve sosyoekonomik şartlardan kaynaklanan duygusal faktörler merkezi öneme sahiptir. Bu anlamda ateistlerin Tanrı’yi algılama biçimlerinin *korku yönelimli* ve *kaçınmacı* bir karakter arz ettiği söylenebilir (Erdoğan, 2015; Erdoğan- Korkmaz, 2014; Hayta, 2006; Gülfil, 2018)
- Dramatik tecrübelerden beslenen kötülük problemi:** Kötülük (teodise) problemi Tanrı’yi inkârda başat faktör olarak karşımıza çıkmaktadır. Ateistler, fizikî ve ahlakî kötülüklerin yanı sıra yaşadıkları dramatik tecrübeleri, sosyoekonomik sıkıntıları, bu kapsamda eşitsizliği, adaletsizliği ve ezilmişliği öne sürerek “*iyi bir yaratıcı olsaydı, tüm bunlar yaşanmazdı*” ifadesiyle eleştirmektedir (Vergote, 1966; 1983; Manafov, 2006; Hökelekli,

2005; Sevinç, 2016; Gülfil; 2018). Bu durum bilişsel açıdan anlama ihtiyacı, duyuşsal açıdan ise yoksunluk hissi ile açıklanabilir

- d) *Anlam arayışı*: Her insan hayatına bir anlam yükleme çabası içindedir. Bu anlamda “niçin varız?”, “niçin bu dünyada bu hayatı yaşıyoruz?” gibi sorulara cevap bulmak ister (Yapıcı, 2003; Bahadır, 2002; Sevinç, 2016). Bazı ateistlerin yaşama “*güçlü olmak*”, “*para kazanmak*”, “*başarılı olmak*”, “*insanlığa katkı sağlayabilmek*”, “*toplumsal ve ideolojik idealler uğruna mücadele etmek*” gibi amaçlarla anlam aradığı, bazılarının ise “*yaşamdan zevk (haz) alabilme*” ve “*mutlu olmayı*” öncelendiği tespit edilmiştir (Gülfil; 2018).
- e) *Rasyonellik peşinde olmak*: Akılcı-mantıkçı bir anlayışla ve bilimin nedensellik ilkesine dayanarak akıl yürüten ateistlere göre hakikatin kaynağı insan ve insan aklıdır (Karaçoşkun, 2013; Bell, 1978; Wilson, 1976; Vergote, 1966; 1983; Gülfil, 2018). Tanrı’nın varlığı ve dinî hükümleri rasyonel zeminde tartışan ateistler bir Tanrı ve dinî inanca bağlanmayı irrasyonel ve saçma olarak kabul etmektedir.
- f) *Bilim ve teknolojiye sınırsız güven duymak*: Ateistler için deney ve gözleme dayanan bilimsel bilgi mutlak hakikati temsil eder. Bu nedenle onlar evreni kontrol altına alan bilim ve teknolojinin güven duyulacak tek gerçeklik olduğunu kabul etmektedir (Kahraman, 2015; Köker 1990; Sevinç; Gülfil, 2018) Bu anlamda ateistler modern bilimi adeta din, bilim adamlarını da o bilim dininin peygamberleri gibi algılamaktadırlar. Bu durumun temel nedeni bilim ve teknolojiadaki gelişmelerle evrenin, insanın ve hayatın sırlarının çözülmeye başladığı düşüncesidir. Bu da bir yandan belirsizlik ve çaresizlik duygularından kurtulmaya, diğer yandan güvenlik ve korunma duygularını tatmin etmeye yöneliktir.
- g) *Ekonomik faktörler*: Ateist eğilimlerde hem ekonomik sıkıntıların (teodise problemi bağlamında) hem de maddi refahın “(liberal ekonomik gelişmeler bağlamında) etkili olduğu saptanmıştır. İster duygusal isterse pragmatik olsun ateistlerin Tanrıyı reddetmesinde hem yoksulu ezen hem de tüketimin hazzını yaşatan kapitalist dünya görüşü etkilidir (Lenin 1994; Topaloğlu, 2001, Gülfil, 2018).
- h) *Modernite ve sekülerizmin dolaylı sonuçları*: Günümüz ateizminin, seküler dünyada muhtemel bir seçenek ve kültürel bir olgu haline geldiği ileri sürülmektedir. Ateist düşüncelerin gelişmesine zemin hazırlayan modernite ve sekülerleşme süreci ateizmi akla yatkın, çağın kültürel ve felsefi epistemolojisine uygun bir tarzda yeniden şekillendirmiştir (Casanova, 2014; Yapıcı, 2017; Gülfil, 2018). Rasyonelleşme, bireyselleşme, özerkleşme, bu dünyaya ait olma gibi özellikleri kuşanan ateistler, sırf dünyevi yaşamla özdeşleşen yeni ateist bir kimlik edinmişlerdir.

Sonuç

Türkiye’deki ateistler farklı nedenlerle ateizmi benimsemiştir. Kişilik ve kimlik özellikleri, sosyalleşme süreçleri, eğitim ve gelir düzeyleri, dine yönelik bilgilerinin kalitesi ve dünya görüşleri bu hususta etkilidir. Dini dogmatik bulan ateistler akıl ve bilim konusunda dogmatik bir tutum sergilemektedirler. Özgürlük, kendi kendine yetme, hazzcılık ve teodise problemi inançsızlığı tercihte merkezi role sahiptir.

Molecular Model – Spatial Thinking Ability Test Development Study

Prof. Dr. Soner YAVUZ,
Res.Assist. Cem BÜYÜKEKŞİ
Zonguldak Bülent Ecevit University, Ereğli Faculty of Education

Abstract

Spatial thinking ability could be defined as ability to revive 3 dimensional objects in mind and mentally manipulate the objects. Spatial thinking ability covers spatial relations and spatial visualization. Performance tests designed to measure spatial ability focus on the ability to visualize the geometric object's translation around an axis in a limited time. In the spatial visualization tests, it is desired to visualize the 3D object of the object shown in 2D, or to invert this process. A remarkable part of the chemistry courses is molecular structures and the arrangement of atoms in space. It can be assumed that spatial thinking ability has effect on students' achievement in chemistry courses. For this reason, it is important to measure and improve the students' spatial thinking skills.

Purpose of this study is to construct Molecular Model – Spatial Thinking Ability Test to measure students' spatial ability. Study was conducted in Zonguldak Bülent Ecevit University Ereğli Faculty of Education with 107 prospective elementary-science teachers. Molecular Model – Spatial Thinking Test was constructed by researchers with 30 items and time limit for the test is 15 minutes. Each test item contains 6 molecules, 1 molecule in question and 5 molecules in answers. 3D molecule structure will be represented in 15 questions and students will be asked to find the correct molecule representation that has been rotated. The next 15 question is designed to students visualize the 3D object of the object shown in 2D or visualize the 2D object of the object shown in 3D.

Data analyzed by "TAP: Test analysis Program". Two items, those point biserial value less than 0,15 , were discarded from test. Analysis of item difficulty indexes gives that result; 2 items are difficult, 11 items are average, 13 items are easy and 2 items are very easy. Mean difficulty index of the test is 0,62 and mean discrimination index of the test is 0,51. Mean point biserial correlation index of the test is 0,47 and all 28 items have enough point biserial value.

Spatial ability has an impact on the success of chemistry lesson, as mentioned in the literature. For this reason, it is important to identify and develop the students' spatial abilities. Molecular Model – Spatial Thinking Ability Test could be used to measure the spatial abilities of prospective teachers who are educated in science.

Monitoring And Enhancement Of Students' Performance For Holistic Development In A Civil Engineering Technology Programme

C-M. CHAN, A.S. Mohd KASSIM, N.A. Mohd ARISH, M.H. ZOHARI,
S.H. ADNAN and I. BABA

Faculty of Engineering Technology, Universiti Tun Hussein Onn Malaysia (MALAYSIA)
chan@uthm.edu.my

Abstract

Students, being the ultimate asset of any institutions of higher learning, need to have their performance carefully monitored and their potential effectively developed while enrolled in the respective academic programmes. This paper describes the established workflow and system for an undergraduate Civil Engineering Technology programme in a public university, from admission right up to the completion of study. At the input end, it highlights the intricacies of enrolment of students from different academic background requiring credit articulation. Once enrolled, the students' academic performance is continuously monitored in accordance with the stipulated learning outcomes per course every semester, which cumulatively add up to the attainment of Programme Outcomes or POs outlined in the Sydney Accord for bachelor's degree in engineering technology. Also included in the discussion is the students' workload over the 4-year programme duration, where balanced distribution of the student learning time (SLT) for the 140 credit-hour programme is presented. In addition, explanation is given on the engagement of extra-curricular activities to hone the students' soft or employability skills not covered in classes, as well as the counselling and talent management services available for the students at zero costs. Finally, arguably the most important component of the management system, i.e. maintaining enthusiasm and motivation of the students, is illustrated with efforts to keep the students' interest intact via various innovations, catering for the myriad learning aptitude, styles and preferences. All in all the holistic development of the students as "humans first and professional second" is embodied in the performance monitoring and enhancement system, with real-time track-keeping of individual student's academic and non-academic accomplishment towards graduation.

Keywords: *Learning outcomes, performance monitoring, workload, student learning time, extra-curricular activities, employability skills*

Introduction

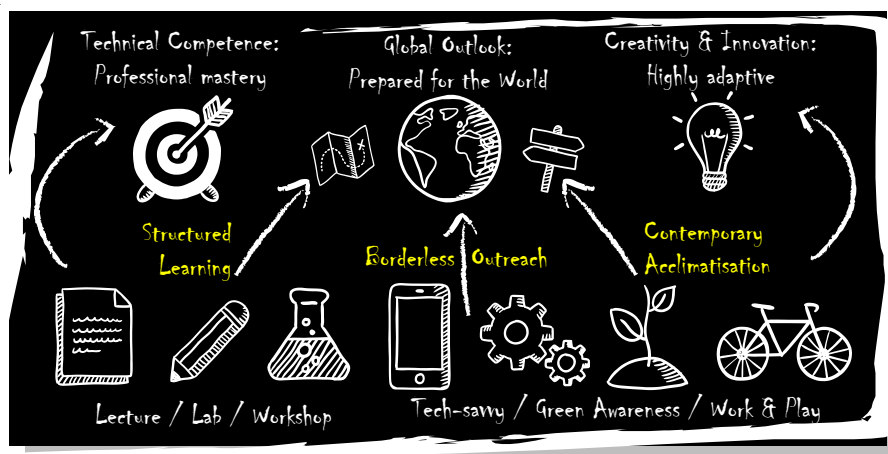

Figure 1: Holistic development to cultivate global technical professionals.

Modern day higher education demands that imparting hard, technical knowledge and skills alone is no longer adequate to provide graduates with a smooth transition to the job market. On the other hand employers have almost always raised concerns on the lack of work-readiness among fresh graduates (Pollard *et al.*, 2015), often relating to poor communication skills and unfavourable mannerisms or attitude. Also, employability concerns and teaching of the related skills are sometimes considered additional chores in the academia on top of the expansive syllabus (Powell, 2010), where the additional time and effort required is perceived to hamper actual teaching in universities (Clegg & Bradley, 2006). Gaping distance between the academia and industry could inadvertently lead to low level of understanding and awareness on the needs, issues and challenges for generic skills development among students too (Chan *et al.*, 2017). Nevertheless, from the students' perspectives, awareness of the importance of soft skills in the work or career context has not gone unheeded (Passow, 2012), with conscious effort being expanded to equip themselves for working life. On the whole, universities are expected to be a training ground to cater for the functional character-building of students, a typical form of

which is shown in [Figure 1], i.e. a balanced development of academic competencies as well as non-academic supporting skills.

Irrespective of the on-going debate and disparity in opinions, the University remains committed to provide the best higher education of an all-encompassing nature to students enrolled in the various academic programmes. This paper elaborates on the performance monitoring and enhancement system developed and implemented at the University for an undergraduate Civil Engineering Technology programme. The specific functions and features of the respective systems are summarised in [Figure 2], of which each component is examined in the following discourse.

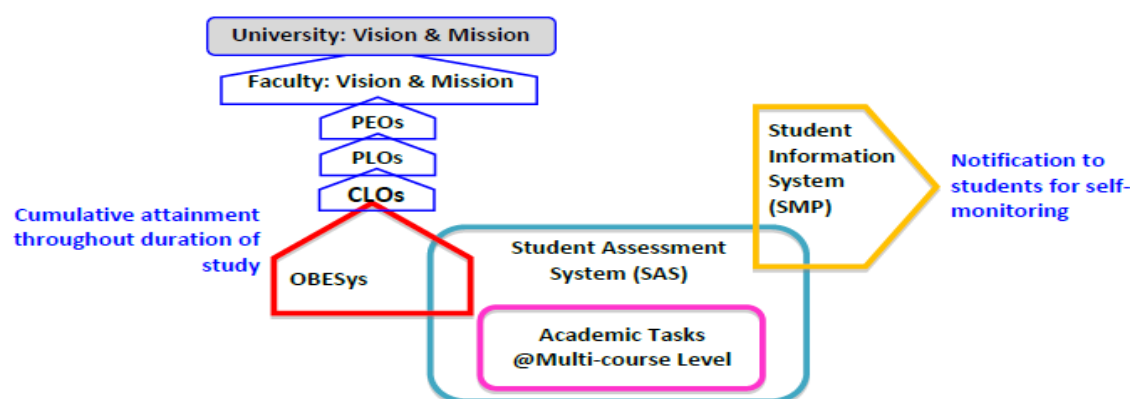

Figure 2: Integrated online systems for real-time data capturing and monitoring of students' performance.

Students' Performance: Measurement

Measurement of Students' Performance per Programme Outcomes (POs)

Students' performance in relation to Programme Outcomes (POs), or more commonly known as PLOs at the Faculty, is analysed using an integrated online system which mainly consists of:

- i) Students Assessment System (SAS)
- ii) Outcome Based Education System (OBESys)

The specific functions and features of the respective systems are summarised in [Table 1].

Essentially, SAS is linked to the Total Campus Integrated System (TCIS). TCIS is an online system which integrates necessary information of personal, teaching and learning activities of each individual staff, both academic and supporting staff. The course coordinator is responsible for input of the mark weightage for continuous or formative (quizzes, assignments, laboratories, workshops, projects and tests) and summative (final examination) assessments. With that, respective lecturers of a particular course can key in the marks as per the weightage preset by the course coordinator. Once the marks for each component have been keyed in, analysis can then be carried out on the attainment of CLOs. With the attainment level of CLOs determined, the respective related PLOs can next be ascertained.

In addition, with the linkage between SAS and SMAP (Sistem Maklumat Akademik Pelajar) on-line, overall marks of both continuous assessment and the final examination can be analysed to measure the CLOs and PLOs attainment. The integrated system allows the student to monitor their grades online too. Also, both lecturers and the Faculty's management personnel are able to monitor and evaluate the students' academic performance on a real-time basis. OBESys is linked to SAS as an instrument to capture the cumulative attainment of POs as a student progresses through the semesters. As SAS keeps tab of the fulfilment of CLOs per course, the timebased contribution of the respective CLOs to the POs can be monitored based on the predetermined CLO-PO mapping. In addition, OBESys enables the attainment of POs to be analysed per individual student or cohort, making the measurement of students' performance at both the macro and micro level simple and possible.

In the current practice, learning outcomes for each course (CLOs) are mapped to the respective programme learning outcomes. At the end of the semester, the attainment of CLOs for each course is measured through SAS. Once the programme completes a full cycle of implementation, the final POs' attainment can be readily measured. Note too that the Faculty is committed to the Key Performance Indicator (KPI) of each PLO to be 60%, where students' achieving less than 60% in the assessments will be subjected to corrective measures for future improvement.

Table 1: Summary of functions and features of the integrated online systems.

No.	System	Basic Function	Features
1.	SAS	Keeps record of Continuous Assessment and Final Examination	<ul style="list-style-type: none"> - Online system linked to TCIS - Systemized compilation of courses' assessment
2.	OBESys	Student's Outcome Based Learning Assessment	<ul style="list-style-type: none"> - Online system linked to TCIS - Analysis of CLOs' attainment - Analysis of PLOs' attainment - Continual Quality Improvement (CQI)

Students' Workload

The Programme curriculum structure has been designed to ensure that student's workload is appropriate and effective as per the student learning time (SLT), where students are not overburdened with academic activities but have adequate quality time to participate in extracurricular activities for cultivation of soft skills and character-building in general. The students' workload is calculated based on the allocated credit of each course. Each credit weighs 40 notional hours SLT per semester, which includes face-to-face and non-face-to-face learning such as lectures, tutorials, laboratory works, projects, field works, practicum or other academic-related activities.

Students who graduate on within the stipulated period would have spent a total of 8 semesters with an accumulated total credit hours of 140. This includes 12 credits for Industrial Training in the final or 8th semester of the final year of study. The distribution of credits and SLT hours per semester for an academic year is shown in [Table 2].

As indicated in [Table 2], a student is expected to spend approximately 480 - 760 hours (12 – 19 credits) SLT per semester or equivalent to 20 to 54 hours SLT per week. On the credit load for one semester, students are advised to register no more than 18 credit hours per semester. However registration of 19 to 21 credits is permissible by the Regulations only with the Dean's approval. The written approval must be attached during course registration for the semester. The academic workload for each course must be clearly specified in the Lecture Plan, including all activities and assessment for the respective course.

Table 2: SLT hour distribution for the Programme.

Year of Study	Semester I			Semester II		
	Credit	SLT Hour per Sem	SLT Hour per Week	Credit	SLT Hour per Sem	SLT Hour per Week
1	18	720	52	18	720	52
2	19	760	54	19	760	54
3	18	720	52	19	760	54
4	17	680	49	12	480	20

As part of the good practices of CQI, recommendations made for future improvement of a particular course can be retrieved from the OBESys and implemented for the current semester, hence closing the loop of translating feedbacks into useful feedforwards for the course per se. The Lecture Plan would be submitted to the Faculty before the commencement of the semester, a requirement as prescribed in the Teaching Appointment Letter for each course lecturer.

Engagement In Extra-Curricular Activities

To nurture an ideal graduate with the ability to lead a balanced professional and personal life upon graduation, academic prowess must be grounded with ethical and moral values, and complemented by good judgement and common sense. It is compulsory for UTHM students to choose any two co-curriculum courses on offer throughout their period of study, where each course carries a 2-credit hours. In addition, students are encouraged to participate in various non-academic activities organized by the sport clubs, uniform bodies and cultural societies. Students are also encouraged to take part in competitions and organized cultural visits, and to attend seminars, talks or workshops to enhance their understanding of topics beyond the Programme, to hone their soft skills as well as to enlarge their social circle and networking for beneficial ends.

There is a variety of activities organized throughout the semester to meet the different interests and preferences of the students. For instance, the UTHM Sports Unit organizes intervarsity sport events, Staff and Students Sports Carnival, Residential College Sports Carnival and other jointly organized sporting events and tournaments. The Cultural Unit, on the other hand, runs activities concerning music, singing, dancing and theatre with rich Malaysian flavours for the benefit of both local and international students. The University also continuously strives to provide a conducive environment (facilities and services) to maintain students' enthusiasm and motivation throughout the academic years. Facilities available such as state-of-the-art library, student dormitories, buses, sports facilities through the Curriculum, Sports and Culture (PKSK), University Health Center (PKU), bank services, mosque, Centre of Counselling and Student Development (PKPP), Office of Student Affairs (HEP), Centre for Graduate Studies, International Office and others.

To inculcate a sense of independence and leadership among students, the University encourages students to share ideas and propositions for activities to narrow the gap between the students' preferences and the University's often conservative ideas that mean well but may not necessarily suit the temperament of the generation. The activities are generally organized under registered societies or associations as approved by HEP. At the Faculty level, the students' activities are in general managed by the student club, i.e. Engineering Technology Club (ETeC). ETeC has organized a number activities of academic and non-academic nature. An example of a non-academic programme organized by ETeC is the outbound mobility to Perth, Australia. At the Department level, several Technical Visits have been organized to widen the students' learning sphere as well exposure to the industry. These include the visits to Kualiti Alam and the Public Works Department. In addition, Corporate Social Responsibility (CSR) programmes are periodically arranged to develop the students' social awareness, civic-mindedness and sense of volunteerism via engagements in activities related to their fields of study. The Solid Waste Management and Composting programme as well as the Residential House Fixing and Repairing activity constitute 2 of the events. University-wide students' activities are primarily under the care of the Student Development Centre (P3P), carried out as part of the Students' Development Programme (PROPEMP) for all. The activities include ETEC4U, Hike Tech and *Program JatiDiri*.

Counselling And Advisory Services

The Student Development Centre (P3P) is led by two main units at the University, namely the Careers Department and the Counselling Department, and assisted by the general administrative unit. The main goal of P3P is to assist in personality development and soft skills cultivation among students by honing and sharpening their potential. P3P essentially provides opportunities for students to identify and nurture their respective talents for academic performance and future career interests. Counselors of recognized expertise and experience play the role of facilitating and guiding students while serving as a source of inspiration for students to excel through the programmes on offer. Details of the activities can be referred to at <http://p3p.uthm.edu.my/v2/>.

The Centre is also responsible for providing face-to-face counselling and e-counselling services. The counselling sessions are professionally conducted and free of charge, with ensured confidentiality and privacy of the students (**Appendix C4-6a: PSP- 9 Counselling Session Procedure**). Apart from assistance to be mentally prepared to fare well in the current academic work, students can also request for career advices and guidance as early preparations for their future engagement, such as preparation for job interviews and aptitude tests via specially organised recruitment or career fairs and employer presentation sessions. In addition, the Centre regularly conducts counselling clinics, career galleries and exhibitions as well as counselling research studies and publications. All in all the services by P3P can be summarized as follows:

- i) Provide guidance and professional counselling to individuals or groups so that the students can handle the problems/obstacles to balanced and brilliant.
- ii) Assist students to solve the problem of academic, personal, social and career.
- iii) Equip students with information, knowledge and experience related to the physical, emotional, spiritual, intellectual and social development so that they acquire academic excellence and character.
- iv) Implement development programmes to all the students.
- v) Implement programmes of academic guidance to students.
- vi) Implement programmes to improve self to all the students.
- vii) Administer psychological tests to the students

Some of the main events organized by the Centre as listed in [Table 3] clearly illustrate the diversity of engagement available to meet the needs of students in terms of self-development and mental wellbeing. Alternatively, students can always refer to their respective Academic Advisors in person or via the PA online system at e2.uthm.edu.my/ppa/pa/online, the Head of Department or the Deputy Dean of Students' Affairs and Alumni at the Faculty for advice and assistance pertaining to academic or non-academic matters. In a nutshell,

students are given every access to assistance and guidance for their wellbeing at the University, whether on matters of academic or personal nature. This is all part of the University's aspiration to provide a vibrant, conducive and exciting learning environment to spur the students towards excellence.

Maintaining Students' Enthusiasm And Motivation

The learning experience at the University is enhanced through the implementation of a variety of channels, such as e-learning, Problem-based Learning (PBL), Full Online Classroom (FOC), Massive Open Online Courses (MOOCs), fieldwork and others. These innovations are adopted to facilitate meaningful learning for the students covering a wide spectrum of aptitude and learning styles. Indeed, the different approaches open up a diversified learning experience for the students, allowing them to identify and enhance their personal learning pace and preference for the most effective results. The diversity in delivery of lessons also train students to be adaptive and flexible in their receipt, processing and integration of newfound knowledge. Such versatility would certainly serve them well as graduates in the marketplace upon graduation.

A recent installation, the Centre for Global Online Learning UTHM (CGOL) was established with the specific aim to plan, coordinate and monitor the development and implementation of various initiatives for e-Learning at the Faculty and University level (<http://global.uthm.edu.my/uthmmooc.html>). The Centre also facilitates the implementation of Massive Open Online Courses (MOOCs) where students can access the course materials anywhere and anytime through <https://www.openlearning.com/malaysiamoocs> website. This is evident of the University's effort to keep abreast of the latest trending in tertiary education at the global arena, where physical boundaries are dissolved and co-sharing of resources are made possible with advanced internet access. Students of the digital generation surely appreciate the 'speed of things' to facilitate their learning.

Understandably the current open access to various learning resources require students to become more actively involved and personally responsible for their own learning. The seek for knowledge is no longer restricted to printed books and articles but expanded to online academic or research forums and blogs keeping real pace with the latest development of the field area. Internet access is rudimentary and the University is constantly upgrading its services to cater for the students' needs. With a fast and smooth access to the internet, students are assured of less hiccups in information searching and retrieval, giving them more time to dissect the information for in-depth learning. Such advantages and efficiency in time management inadvertently encourage students to be more driven for academic excellence.

Moreover, several funding is available for students to finance their studies. The main financial support comes from the *Perbadanan Tabung Pendidikan Nasional* (PTPTN). Apart from PTPTN, students can also apply for scholarships awarded by the Ministry of Education, Public Services Department, State Governments, other Government Agencies as well as private companies. The University also provides financial assistance to students who are facing financial difficulties by using a special fund from Student Affairs Office. Furthermore, two-way interaction between lecturers and students is keenly encouraged to improve the students' academic performance and to enrich their learning experience. Examples of these exercises include impromptu Q&A sessions in class, short sub-topical discussions and brainstorming sessions, pop quizzes conducted verbally in class, among others. Also, timely assessment of submitted work with constructive feedbacks by the lecturers is crucial for the comments to be incorporated in future work for continuous improvement of the students. This active and consistent feedback mechanism helps students to stay focused on their studies while steadily making progress in their learning of the subject matter. Maintaining such positive outlook of learning would help students to persevere as they ascend the learning curve of the Programme as a whole.

The implementation of Problem-based Learning (PBL) does not only engage students in the application of theories and principles in actual field problems, but stimulate them to think outside the box to resolve technical problems often requiring a combination of several solutions. PBL also gives students the opportunity to work in

groups, inculcating the spirit of teamwork and developing leadership, simultaneously sharpening a number of other soft skills like communication, critical thinking, information management, social awareness and responsibilities, professional ethics and moral boundaries. The close-knit group settings simulate real-life working environment, where students learn through alternating role plays as both leader and team member, sharing the workload, materials, resources and ideas for the success as one. Such deviation from the conventional individual assignments undoubtedly makes learning more fun and interesting for the students, garnering better enthusiasm and motivation in healthy competition among their peers. Last but not least, other than the activities describe in section 4.5, other extra-curricular activities known to improve students' motivation and enthusiasm include the industrial talks and seminars organized at Faculty and Programme levels, UTHM Starting School Program and Dean's List Award Ceremony.

Conclusions

The Faculty and University aspire to groom and develop graduate engineering technologists who are all-rounders, equipped with sound technical competencies and essential employability skills of the 21st century. Aligned with the maxim of "humans first and professional second", the continuous students' performance monitoring and enhancement system ensures a structured process of character-building throughout a student's 4-year course of study, intricately weaving professional mastery with non-academic but necessary skills to thrive upon graduation, in life and their respective careers.

Acknowledgements

Appreciation is due to the Faculty's **AA Team**, both academic and supporting staff, who literally worked round the clock in preparation of the accreditation documents. Kudos!

Moolc Design And Development Process For An Agglutinative Language: "Türkçe Öğreniyorum" Case

Özlem Ozan
Yasar University

Yasin Özarslan
Yasar University

Hilal Seda Yıldız Aybek
Yasar University

Abstract

Massive Open Online Courses (MOOCs) provides individuals with flexible, affordable, self-paced learning opportunity with fast-track completion option. "Türkçe Öğreniyorum (Learn Turkish)" is an example of a well-prepared language MOOC for the teaching of Turkish at A1 level. Although MOOCs have a decade of history and expanding literature, designing efficient language MOOCs is a relatively new era and has limited research. In this study, design and development know-how of "Türkçe Öğreniyorum (Learn Turkish)" will be shared to contribute filling the gap in the field of designing and developing MOOLC for an agglutinative language.

Keywords: MOOLC, MOOC, agglutinative language, Turkish, language, language learning, design, development, know-how

1. Introduction

In the last decades, various distance and open learning programs and online educational delivery models have been developed to address access, affordability, and personalized learning in higher education (Hill, 2012). Nowadays with the advent of Massive Open Online Courses (MOOCs), new online educational models have emerged that promise to offer flexibility, affordable access and fast-track completion for free or at a low cost for whoever is interested in learning (Yuan & Powell, 2013). In fact, MOOCs support the idea of distributed intelligence and lifelong learning, open learning, open educational resources and represent a new generation of online education that encourages the development and delivery of courses that are massive, open, participatory (Perifanou, 2016). In the last decade, MOOCs have diversified in the context of different design approaches, goals and types of interaction. The concept of MOOLC is also one of these MOOCs types. MOOLC is basically defined as MOOCs with customized designs for language learning.

Language MOOCs as an evolving and expanding area with new developments likely to offer a greater variety of courses and more innovative social learning pedagogies (Perifanou, 2014). Currently, practitioners, language teachers, instructional designers are exploring how to design efficient language courses that have the characteristics of open access and massiveness. On this basis, design and development know-how of "Türkçe Öğreniyorum (Learn Turkish)" MOOLC is presented in this study as an effort of experience sharing.

2. "Türkçe Öğreniyorum (I learn Turkish)" MOOLC

There is an increasing demand for learning Turkish as a foreign language over the last decade (Bayraktar, 2005; Büyükkız & Hazırcı, 2013; Yahşi Cevher & Güngör, 2015). Teaching Turkish as a foreign language abroad is coordinated by Yunus Emre Institute (YEI). According to YEI's annual report, 12.000 students were enrolled in courses offered by YEI to learn Turkish, and the number of students who took elective Turkish language courses in schools reached 8.000 (Yunus Emre Institute, 2016). The number of foreign students in Turkish higher education institutions is 125030 in the 2017-2018 academic year (The Council of Higher Education, 2018), and the number of those in primary and secondary education is 232714 (İBGİGM Migration Report, 2016: 43). According to Migration Authority, the number of foreigners in Turkey who has with a residential permit is 718297 as of August 2018. However, current digital learning materials are very limited in terms of both quality and quantity, and far from fulfilling this demand. There is a large gap especially in providing self-paced materials. There is two traditional distance education programs, and a comprehensive, well-structured, non-profit MOOLC. Distance education programs are provided by Anadolu University and Yunus Emre Institute, where the MOOLC is provided by Yasar University under the name of "Türkçe Öğreniyorum (I learn Turkish)".

The objective of "Türkçe Öğreniyorum" Project is to develop a worldwide distance learning platform, which is sensitive to individual differences and can differentiate the content according to the needs of the learner. The primary goal of "Türkçe Öğreniyorum" is to provide continuous access to qualified self-paced learning materials

for the Turkish language. It was developed under "the Differentiated Distance Education of Turkish as a Foreign Language" project, supported by TÜBİTAK with the project code of 115K270. It is limited by level A1, which is referenced in the Common European Framework of Reference for Languages

In "Türkçe Öğreniyorum", there are 53 chapters, each chapter bearing 5-minute lecture videos, 2-minute real-life drama videos, reading-listening-writing-pronunciation activities, approximately 40 games, one A1 level dictionary containing 1.500 vocabulary, approximately 6000 questions in total, a dictionary of rules, one forum and a virtual meeting application. Approximately 40.000 words of text in Turkish translated into English, Arabic, Russian and French language to offer support to learners. "Türkçe Öğreniyorum" runs on Sakai LMS, which is integrated with Kaltura Video Platform and Google Analytics. Learning analytics data is gathered from Diagnostics tool, Motivational Beliefs and Self-Regulated Learning Strategies Questionnaire (MLSQ), Logs of exercises, LMS Statistics, and Google Analytics. Diagnostics tool covers demographic information of learners, their primary and secondary languages, prior knowledge of Turkish, and home country. The aim of this tool is to collect data about learner profile in terms of the region they live in and the language they speak. MLSQ is used to detect cognitive and affective readiness of the learner in terms of intrinsic value, test anxiety, cognitive strategy use, and self-regulation (Pintrich & DeGroot, 1990). Logs of exercises record activity events of the learner (number of tries, given responses etc). Sakai CLE collects site usage statistics regarding learner visits, tool activity, and resource activity. Google analytics provides a rich source of data such as learner preferences (demographics, interest, age, geo, etc.), time spent on modules, page statistics (page view, page exits, behavior flow, etc.), preferred technology (device, browser, operating system, screen resolution, screen colors, etc.), video events (video view duration, numbers of play, pause and skip attempts, etc.).

Project team contains 2 instructional designers, 4 subject matter experts, 1 graphic designer, 1 video developer, 1 multimedia developer, 1 photographer, 1 system administrator, 1 software developer, 4 translators, 7 actors, 6 voice actors, 3 cameramen, 2 production specialists, 2 post-production specialists, 1 cinema director, 1 scriptwriter, 1 assessment and evaluation specialist and 2 consultants.

ADDIE [Analysis, Design, Development, Implementation, Evaluation; (Morrison et al., 2010)] was used as an instructional systems design model.

3. Analysis Phase

The main objective of the project is to provide flexible learning opportunities and continuous access to qualified self-paced learning materials. The central concern of the project is to differentiate the content according to the needs of the learner. Therefore, our focus in this phase was on diagnosing the learner profile and the explore most common linguistic errors they made to examine who struggles in which topics. A registration form -which contains gender, age, nationality, residency, mother language, the number of foreign languages that learner knows, education level, employment status, internet usage habits, reasons of learning Turkish, prior knowledge of Turkish - created to define learner demographics. In addition, one focus group discussion conducted, and 177 A1 level writing exam papers were analyzed. Focus group discussion conducted with 8 international students from China, Pakistan, Malaysia, Nigeria, India, Serbia and Bosnia who participated voluntarily. Learners were asked to share their experiences of learning Turkish, reasons of learning Turkish, the differences and similarities between their own cultures and Turkish culture, commonly used methods for learning Turkish, and what features a language MOOC should have. A1 level writing exam papers of 177 learners were analyzed to diagnose learners' needs. Linguistic error analysis techniques were used for error analysis. According to results, there was a relationship between error frequency and learner group (Arabic-Farsi, Turkic, Balkan and Other). The errors density varied as a function of the learner group. Therefore, it was decided that differentiation for teaching Turkish as a foreign language should be made according to learner group on the topics which they have high errors density.

4. Design Phase

In the design phase, the design of interfaces, content structure, lessons, assessment and evaluation processes, support and communication tools were performed.

4.1. Design of interfaces

This phase covers the interface design of the web page and Learning Management System (LMS). Graphic designers and researchers worked together in this step to design the web page, Figure 1, and customize Sakai CLE LMS's user interface, Figure 2.

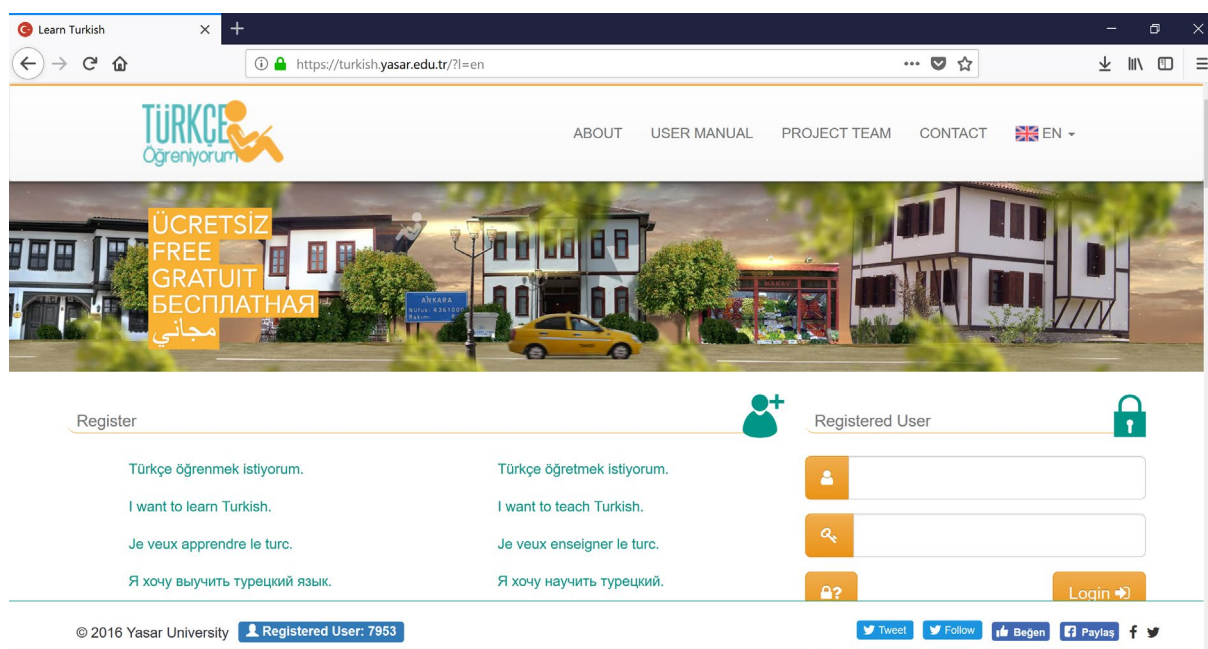

Figure 1: Web site Interface of "Türkçe Öğreniyorum"

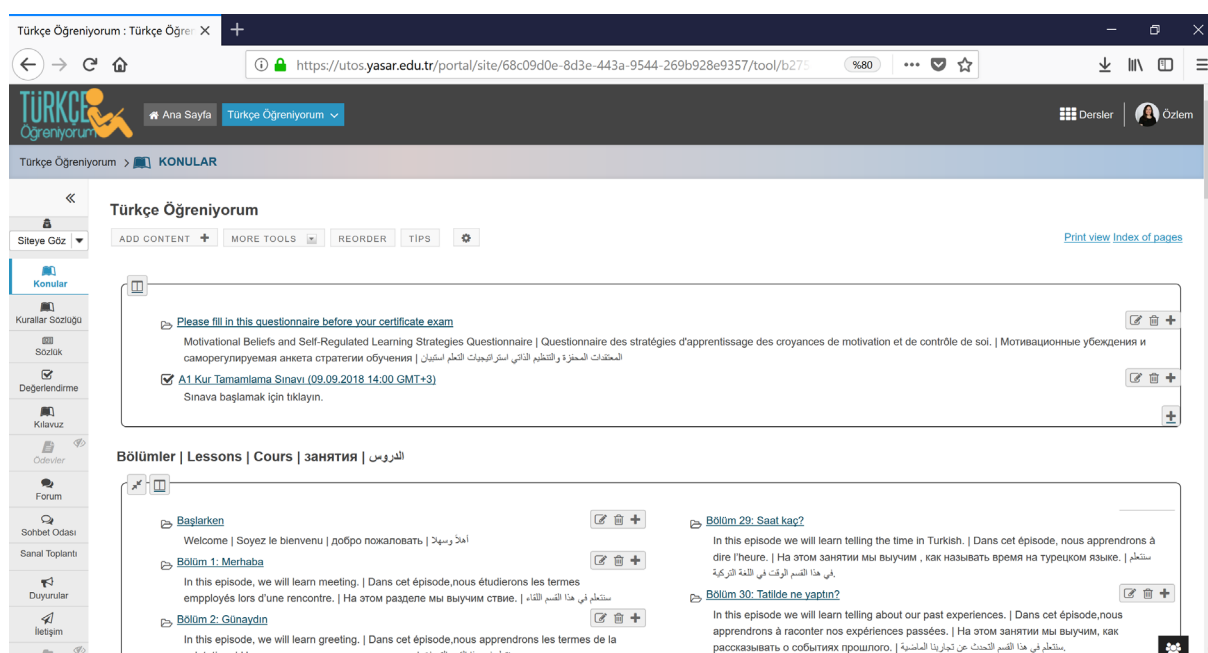

Figure 2: Customized Sakai LMS user interface of "Türkçe Öğreniyorum"

In the design process, green and orange colors were chosen for web interface and logo since green color has a strong association as a refreshing and peaceful color and orange is the color of joy, creativity, sense of general wellness and emotional energy, and warmth.

4.2. Designing structure of content

Structure of content of "Türkçe Öğreniyorum" was based on five theoretical approaches. First one is the theory of transactional distance, which establishes a relationship between dialog, structure, and learner autonomy (Moore, 2007). Second one is theory of self-regulatory learning, which is critical especially in distance education because of the absence of the very active role of the instructor and the requirement for high-autonomy (Hsu et al., 2009), goal setting, self-monitoring, self-evaluation, use of task strategies time planning and management (Dabbagh & Kitsantas, 2005). The third one is the Theory of Multimedia Learning (ToML). Forth one is Tomlinson's (2001) approach for differentiation of instruction. The final one is Notional-Functional Approach (Ellis, 2005; Halliday,

1986; Hymes, 1971) as second language teaching theory as shown in Figure 3. Based on this theoretical framework, "Türkçe Öğreniyorum" system consists of 53 lessons/modules. In addition, it comprises Dictionary, Dictionary of Rules, User Guide, Forum, Virtual Meeting and Certificate Exam Tool.

Figure 3: Theoretical background of “Türkçe Öğreniyorum” MOOLC

In this stage, the learning environment, constraints, the delivery options, and the timeline for the project were also considered. After a systematic process of specifying learning objectives, detailed storyboards and prototypes were done. The user-interface, content and learning materials determined based on the design phase was produced at the development phase.

Learning materials are designed and developed for target groups of learners. Course difficulty is pitched to the group's educational level, and examples or exercises are selected from the learner's environment. Materials obtained through collaboration with other institutions. Although the basic content of shared teaching and learning materials stays the same, the examples, arguments or explanations is adapted to differentiate depending on the learner group. All shared resources are reviewed to determine what changes are needed and supervise adapting the resources to the needs of learner groups.

3.2. Designing Lessons

Each lesson contains approximately 5 minutes of lecture video with relevant grammatical information, drama videos designed in the context of 1-2 minutes of daily dialogue, activities involving exercises and games to reinforce the learned subject, a book chapter end test that allows the learner to self-evaluation components, Figure 4.

GERİ İLERİ

Figure 4: Course structure

For each section, the learning objectives are determined firstly. In line with the objectives, raw content was written by subject experts for lecture video. After that, the instructional designer created a scenario based on that raw content. Each scene was designed carefully by the instructional designer. Tables, illustrations, photographs, off-voice narrations, dialogs were defined in separate excel files. Learning activities of “*Dinle ve görseli seç*” (*Listen and choose the image*), “*Görseli yaz*” (*Write the image*), “*Dinle ve seç*” (*Listen and choose*), “*Boşluğa yaz*” (*Fill*

in the blanks) were designed similarly based on that raw content. The differentiated content was also produced based on this raw content. Some examples of files used in the design and production process were shared in Figure 5.

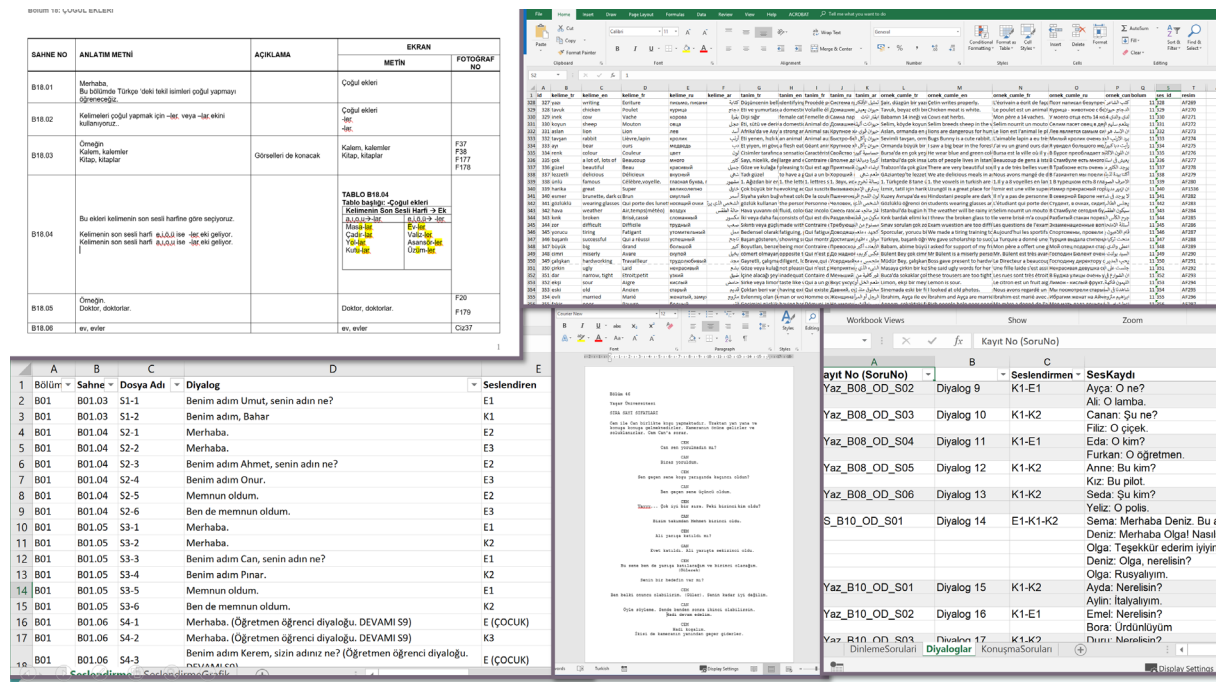

Figure 5: Some examples of excel file used in design and production process

Scenarios of drama videos are written by screenwriters, and they were controlled by the instructional designer and content experts. A book, which contains text of videos and vocabulary of the module, was also designed. Furthermore, a "User Guide" which includes short tutorials for learners about the use of the tools in the system was designed. In designing user guide, instructional designers defined the titles of the subjects and designed screens, screen texts and created video subtitles. A similar process has been done for the introduction video where basic information about the system is presented.

4.3. Designing the Assessment and Evaluation Processes

Self-assessment is tools should be provided in MOOC environments since it critical especially in MOOCs because of the absence of the role of the instructor and the requirement for high-autonomy. Learners in MOOCs are responsible for their own learning by arranging the time, pace and strategies. Therefore, self-assessment tests and feedback for each activity were placed in modules. The learner can take self-assessment tests multiple times, there is no time limitation in the test as well. Also, the *System Statistics* tool allow learners to track their learning process.

In this phase, questions and feedbacks were created by content experts for each module. After that, instructional designers edited the questions and eliminated the ones which were not compatible with LMS requirements.

4.4. Designing the Support Tools

Problems, which may encounter in the system and require support to learners, are determined as non-functioning /malfunctioning content such as broken link, "how-to" problems such as how to log in, a technical problem such as sound problems. Hence, the support content was divided into categories as shown in Figure 6.

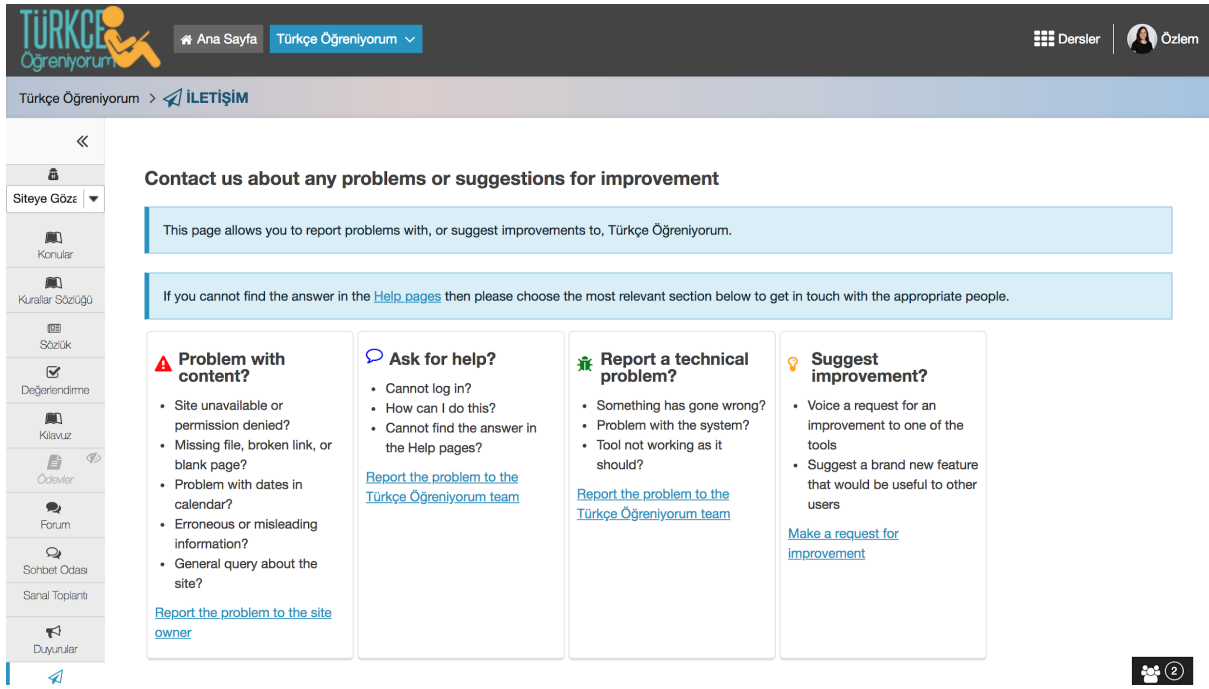

Figure 6: Support Tool

5. Development and Production Phase

In the production phase, the web page was developed, LMS was set up, video, analytics, and other services were integrated into LMS. After that, the content was developed and uploaded to the LMS platform. A customized web page created for registration of the user. The registration form was integrated to the web page. It collects demographic information of learners in four steps. At the final step, e-mail verification is used for approval of account information. This web page has multilanguage support.

Open source Sakai CLE was chosen as Learning Management System since it provides a wide variety of tools for activities and learner statistics. Kaltura MediaSpace was customized to serve as a repository for media collections. It is an open, flexible, and collaborative video platform and services for organizations. Kaltura offers the broadest set of video management and creation tools integrated with LMS. With a single video portal Kaltura MediaSpace, all our video/audio content is centralized and delivered in high quality to any device. We enriched our videos to make more engaging and discoverable experience by adding captions. It also provides localization configuration to adopt online content for regional specificity. Kaltura Built-In Analytics was used for user-level (which is the most viewed video or which videos were 100% play-through, which users watched the video and for how long/many times and their watching behaviors) and system reports (information per the OS, browser, or platform used). Kaltura and Google Analytics integration was made to track how users are engaging with content in different geographies and across different platforms (desktop, mobile etc.), operating systems and browsers.

Free web analytics tool Google Analytics offered by Google was used to track users and analyze their events in the learning environment. It provides a wide variety of information about the activity that takes place on LMS and MediaSpace of "Türkçe Öğreniyorum" Learning Environment. Google Analytics show data through metrics, which measure behavior, and dimensions. It helped us to describe who learners are and analyze their behaviors in the Learning Environment. In addition to analytics tool, MLSQ (Motivated Strategies for Learning Questionnaire) was integrated into the platform as a beginning module to measure the types of learning strategies and academic motivation used by learners.

Afterward, the production of the lecture and drama videos were conducted for 53 episodes in total. In the production of lecture videos, the following operations were carried out:

- Green screenshots
- Off-voice recordings for dialogues
- Photo shoots and procuring photos which could not be shot from stocks
- Drawing of illustrations or procuring them from stocks
- Designing of tables by the graphic designer in accordance with the screens
- Video editing
- Post-production.
- Uploading subtitles in Turkish, French, English, Arabic and Russian

Each section has drama videos that contain sample cases from everyday life. During the production of these videos, the following processes have been carried out:

- Venue selection
- Training of casts
- Making video shots
- Video editing
- Post-production.
- Uploading subtitles in Turkish

Figure 7: Behind the scenes images of video shootings.

Production of the lecture and drama videos were followed by the production of games, book, activities, dictionary, the dictionary of rules was conducted for 53 episodes in total. Photo shootings, illustrations, and sound recordings were performed in the same way for the activities (Dinle ve görseli seç, görseli yaz, dinle ve seç, boşluğa yaz), dictionary and dictionary of rules. Dictionary and dictionary of rules were translated into English, Arabic, Russian end, French. The books, which includes basic concepts, keywords, dialogues, and glossary in the videos, were prepared by the graphic designer. Next, User Guide and Introduction videos were prepared by screen recording method. Subtitles were also used for these videos. Finally, all the produced content was uploaded to the LMS, and usability tests were conducted.

6. Implementation phase

Following the design and development process, "Türkçe Öğreniyorum" MOOLC was launched and opened to the public use via <https://turkish.yasar.edu.tr/>. The official enouncement was made Yaşar University to universities, the ministry of education, the ministry of foreign affairs, embassies, social media was used for dissemination of the system as well.

7. Evaluation

In order to evaluate the system, user profile and learning behaviors are still being monitored by the means of Google Analytics, Analytics tool of Sakai LMS, MLSQ tool, registration form, and Analytics tool of Kaltura platform.

Conclusion

Learning in the 21st century is characterized by the tendency of time and space independence. The information and communication technologies play a central role in increasing the autonomy of individuals and facilitating fulfillment of learners' demands to take more of their differences and needs into consideration. The diversity of technologies and tools used for learning also makes it easier for individuals to address different learning needs and

preferences such as MOOCs. In this study, design, develop and implementation phases of "Türkçe Öğreniyorum" MOOLC was presented as an effort of know-how sharing. ADDIE was used as the instructional systems design model. In the analysis phase, our focus was on diagnosing a learning profile and the explore most common linguistic errors learners made to examine who struggles in which topics. In the design phase, the design of interfaces, content structure, lessons, assessment and evaluation processes, support and communication tools were performed. In the production phase, the web page was developed, LMS was set up, video, analytics, and other services were integrated into LMS. After that, the content was developed and uploaded to the LMS platform. In implementation phase "Türkçe Öğreniyorum" MOOLC was launched and opened to the public use. Learning analytics will be used in the evaluation phase.

Moral Attitudes Of High School Students

Blandina Sramova
Comenius University in Bratislava
sramovab@fedu.uniba.sk

Abstract

The paper is focused on finding the stage of moral development of contemporary high school students. The focus of the presented paper is to analyse the way of thinking about moral dilemmas by adolescents. The sample consisted of Slovak adolescents ($N = 250$) with average age of 16.5 years. Their task was to solve the dilemmas presented by us. The resulting findings pointed to the degree of moral reasoning, which is based on respecting the social rules. It also showed that dealing with moral dilemmas ties to the internal values of the adolescents. We also found relatively high competence of moral reasoning (per Piaget) by the participating adolescents.

Motivation And Rewards For Special Education Staff: A Focus Group Study On Greek Employees

Noula ALVANOUDI

Department Of Educational And Social Policy
University Of Macedonia, Greece
Noula@Uom.Edu.Gr

Miltiadis STABOULIS

Department Of Educational And Social Policy
University Of Macedonia, Greece
Staboulis@Uom.Edu.Gr

Abstract

The Aim Of This Study Was To Examine The Rewards For Special Education Staff And Its Importance For Their Motivation. For The Purpose Of This Study, A Focus Group Of Special Education Employees Was Set Up To Determine Their Perceptions, Feelings And Thoughts About Motivation And Rewards In The Work Environment. The Conceptual Research Framework Of Rewards Was Based On Total Rewards Model Of Towers Perrin, Which Embrace Everything That People Value In The Employment Relationship. Through The Focus Group, The Rewards That Were Provided In Their Work Environment And Were Important For Them And Their Motivation Were Identified, While Those Few That Were Not Included Were Determined. The Total Rewards Framework Proved To Be Appropriate And Useful In Understanding The Perspectives Of Special Education Staff On Rewards. The Findings Support The Notion That The Aspects Of Conceptual Research Framework That Concern The Work Environment Are The Rewards, Which Are The Most Important For Their Motivation, Followed By Those That Concern Benefits, Learning And Development. From The Focus Group We Draw Also Conclusions For The Factors That Affect Employee Motivation And The Rewards That Were Applied. The Significance Of Devotion To The Area Of Special Education And The Conscious Choice Of The Profession Were Highlighted By All The Participants. At The Same Time, The Focus Group Participants Completed The Motivation Work Scale (MAWS) Which Is Based On The Framework Of Self-Determination Theory (SDT). According To The Results, Intrinsic Motivation Has Scored High, Whereas External Motivation Proved To Be Less Important For The Participants. In National Level There Has Not Been Any Similar Study In The Field Of Special Education. The Usefulness Of The Results Lies In The Fact That The Holistic Study Of The Rewards Provided And Its Importance For Motivation Can Provide Feedback On Human Resource Management Decision Making Centers, Trade Union Representation, Employers And The Organization Of Curricula And Lifelong Learning. The Study Can, Also, Provide A Perspective For Future Research Through Total Reward Model Long-Term Exploitation.

Keywords: *Rewards, Motivation, Total Rewards, Special Education Staff, Motivation At Work Scale (MAWS), Greece*

Introduction

Employee Motivation Is One Of The Most Important Issues Of Management As It Is Linked To Human Behavior And Job Performance. Motivation Is Also One Of The Most Frequently Studied Subjects In Organizational Behavior. According To Baron (1991, P. 1) Motivation Is “An Internal Process That Activates, Guides And Maintains Behavior (Especially Goal- Directed Behavior)”. It Is Actually The Process That Explains The Intensity, The Direction And The Persistence Of An Individual's Effort Towards A Particular Goal (Robbins & Judge, 2007).

Furthermore, Rewards Have A Central Place In The Theoretical Models Of Human Resources Management (Storey, 1995). They Can Be Regarded As The Fundamental Expression Of The Employment Relationship (Armstrong, 2009). As Rewards Are Considered “The Benefits That Arise From Performing A Task, Rendering A Service Or Discharging A Responsibility” (Pitts, 1995, P. 13). The Reward System Of An Organization, As Henderson (2000, P. 17) Refers, “Includes Anything That An Employee May Value And Desire And That The Employer Is Able Or Willing To Offer In Exchange For Employer Contribution”. Rewards Are Commonly Categorized As Intrinsic And As Extrinsic (Deci, 1971).

Total Reward Is The Combination Of Financial And Non-Financial Rewards Available To Employees (Armstrong, 2009). It Emphasizes On All The Aspects Of Work Experience Value For Employees, And Not On Some Of Them Such As Pay And Benefits. It Aims To Mix The Financial And Non-Financial Elements Of The Reward Into A Single Set. This Approach Recognizes The Need For Financial Rewards But Also Emphasizes The Importance Of Providing Rewards Stemming From The Job They Are Doing, From The Work Environment, From How They Are Managed And The Opportunity To Develop Their Skills, And Their Careers (Armstrong & Cummins, 2011). As Defined By Manas And Graham (2003), Total Reward “Includes All Types Of Rewards – Indirect As Well As Direct, And Intrinsic As Well Extrinsic”. Each Aspect Of Reward, Namely Base Pay, Contingent Pay, Employee Benefits And Non-Financial Rewards, Which Include Intrinsic Rewards From The Work Itself, Are Linked Together And Treated As An Integrated And Coherent Whole. Total Rewards Combine The Impact Of The Two Major Categories Of Rewards: A) Transactional Rewards: Tangible Rewards Which Arise From Transactions Between The Employer And Employees Concerning Pay And Benefits, And B) Relational Rewards: Intangible Rewards Concerned With Learning And Development And The Work Environment (Armstrong, 2009). An Equally Wide Definition Of Total Rewards Is Offered By Prenzno And Griffith (2000) Who States That Total Rewards Are All The Available Tools That May Be Used To Attract, Retain, Motivate And Satisfy Employees. The Benefits Of Total Reward Approach Are:

- *Greater Impact:* The Combined Effect Of The Different Types Of Rewards Will Make A Deeper And Longer-Lasting Impact On The Motivation And Commitment Of People
- *Enhancing The Employment Relationship:* An Employment Relationship Based On Total Rewards Approach Makes The Maximum Use Of Relational As Well As Transactional Rewards And Will Appeal More To Individuals
- *Flexibility To Meet Individual Needs:* Through Total Rewards The Organization Can Better Meet The Special Individual Needs
- *Talent Management:* The Organization Can Become “An Employer’s Choice” And “A Great Place To Work” Thus Attracting And Retaining The Talented People It Needs (Armstrong, 2009).

Kerr (1997) Refers To The Following Features Of Ideal Rewards: A) Promote Both Efficiency And Equity, B) Meet Not Only Economic And Non-Economic Needs, C) Are Available, D) Everyone Has The Right To Participate In Them, E) Are Communicated To All Employees, F) Are Reversible. The Main Impact Of Satisfactory Rewards Is To Increase Incentives For Employees. Rewards And Incentives Play A Key Role In The Level Of Satisfaction That Employees Derive From Their Work. People Do Not Work Just For The Money. They Are Interested In An Organization That Has A Strong Vision, They Want Their Personal Development And To Give Value To The Organization. A Combination Of Basic Salary, Additional Benefits, Recognition Is Necessary For An Integrated Benefit Package (Zingheim & Schuster, 2000). A Compensation Plan Model For Direct Support Professionals Working With Individuals With Developmental Disabilities Integrates An Assortment Of Factors – Compensation, Benefits, Recognition And Incentives (Kuznia, 2008). Studies Have Also Shown That Teachers Appreciate Intrinsic Rewards, Such As Student Achievement And Positive Relationships With Them (Ashiedu & Scott-Ladd, 2012; Dilworth, 1991; Plihal, 1982; Taylor, Mcnane-Funk, Jardine, Lehman, & Fok-Chan, 2014).

A Number Of Surveys Have Been Carried Out About The Positive Role Of Rewards On Motivation (Deci, 1971; Milne, 2007; Nyakundi, 2012). In Parallel, Many Studies Were Conducted Concerning Employee Preferences In Terms Of Rewards Provided By The Organizations They Work And How These Rewards Can Positively Affect Their Motivation. The Most Important And Most Desirable Rewards According To The Literature Are: Good Salary (Ali & Ahmed, 2009; Dilworth, 1991; Harpaz, 1990; Kim, 2005, 2005; Wiley, 1997), Job Security (Jurkiewicz, Massey, & Brown, 1998; Kim, 2005; Wiley, 1997), Career Development (Ali & Ahmed, 2009; Allen, Shore, & Griffith, 2003; Kim, 2005; Nyakundi, 2012), Autonomy And Initiative (Reeve & Deci, 1996; Richer & Vallerand, 1995; Zuckerman, Porac, Lathin, & Deci, 1978), Good Relationships With Colleagues (Gkorezis & Petridou, 2012; Harpaz, 1990; Kim, 2005), Good Relationship With Supervisor (Evans, 1970), Interesting And With Variety Work (Ali & Ahmed, 2009), Recognition And Reward (Ali & Ahmed, 2009; Gkorezis & Petridou, 2012; Wiley, 1997).

Although, Rewards As A Mean Of Enhancing Motivation Has Been Also The Subject Of Research And Annotation In Education (Ali & Ahmed, 2009; Ashiedu & Scott-Ladd, 2012; Dilworth, 1991; Nyakundi, 2012; Plihal, 1982; Taylor Et Al., 2014), Not Many Studies Were Found Regarding Special Education. Additionally, A Need For A More Holistic Approach, Such As The One “Total Reward” Approach Offers, Exists.

The Study

For The Purpose Of This Study, A Focus Group Of Special Education Employees Was Set Up To Determine Their Perceptions, Feelings And Thoughts About Motivation And Rewards In The Work Environment.

The Conceptual Research Framework (Figure 1), That Was Used For The Focus Group And Concerned Rewards For Special Education Staff, Was Based On Towers Perrin Model Of Total Reward (Armstrong & Brown, 2009, P. 25).

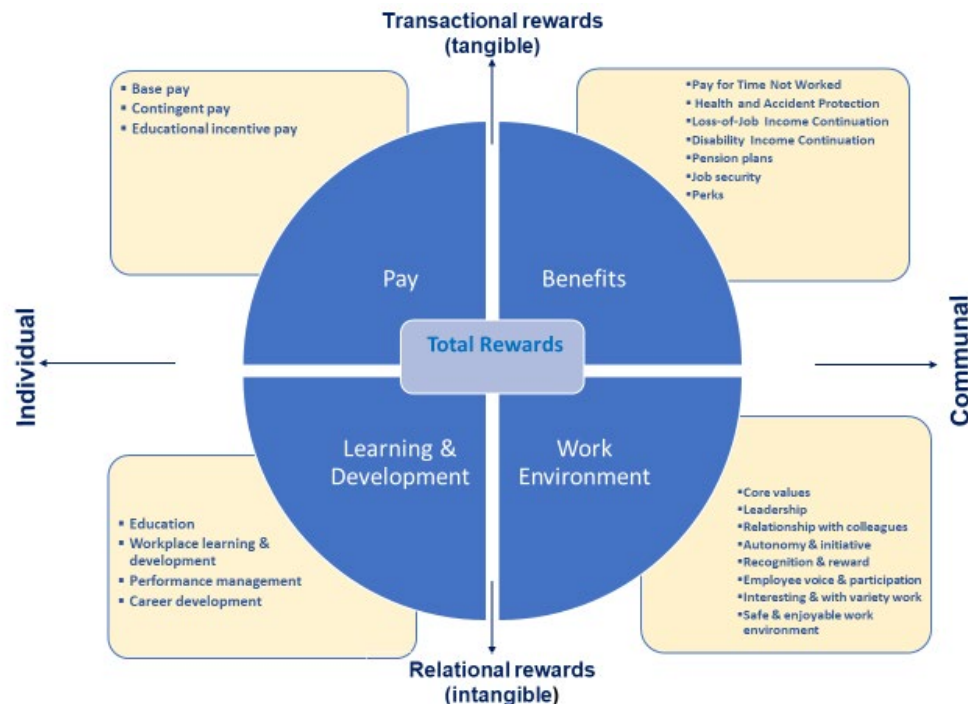

Figure 1: Conceptual Research Framework

The Conceptual Research Framework Embraced Everything That People Value In The Employment Relationship. The Upper Two Quadrants- Pay And Benefits- Represent Transactional Rewards. These Are Financial In Nature And Are Essential To Recruit And Retain Staff But Can Be Easily Copied By Competitors. By Contrast, The Relational (Non-Financial) Rewards At The Two Lower Quadrants Are Essential To Enhancing The Value Of The Upper Two Quadrants, Can't Be Easily Copied And Can Create An Advantage In Relation With The Human Capital And Its Management.

Aims

The Aims Of This Research Were To Determine The Views Of Special Education Employees On:

1. The Rewards That Applied
2. The Importance Of Rewards For Their Motivation

Focus Group

Since The Purpose Of This Research Was To Seek Insight Into The Perceptions, Feelings And Thoughts Of Special Education Staff The Data Required Was Essentially Qualitative. The Two Principal Means Of Collecting Qualitative Data In The Social Sciences Are Participant Observation, Which Typically Occurs In Groups, And Open-Ended Interviews, Which Typically Occur With Individuals (Morgan, 1997). Nevertheless, The Last Years Have Produced A Steady Increase In Social Scientists' Use Of Focus Groups, And There Is A Widespread Consensus That Focus Groups Are A Valuable Technique For Collecting Qualitative Data (Morgan, 1997). Focus Groups With Employees Have Been Helpful In Understanding The Perspectives Of Staff And Also In Identifying Or Testing Potential Policies Or Solutions Strategies (Krueger & Casey, 2000). Central To This Methodology Is To Gather Data On The Topic And Participants' Perceptions And Understanding (Kitzinger, 1994). Focus Groups Provide Also Access To Forms Of Data

That Are Not Obtained Easily With Individual Interviews Or Participant Observation (Morgan, 1997). The Intent Of The Focus Group Is To Promote Self-Disclosure Among The Participants. It Presents A More Natural Environment Than That Of An Individual Interview Because Participants Are Influencing And Influenced By Others- Just As They Are In Life (Krueger & Casey, 2000). The Comparative Advantage Of The Focus Group As An Interview Technique Lies In The Ability To Observe Interaction On A Topic And The Focus Group's Main Advantage In Comparison To Participant Observation Is The Opportunity To Observe A Large Amount Of Interaction On A Topic In A Limited Period Of Time (Morgan, 1997). The Focus Group Also Offers The Option To Not Respond, Which Is Not Available In Other Qualitative Methods. As Fern (1982) Mentions, A Concrete Demonstration Of The Strength That Focus Groups Offer Is That A Two Eight-Person Focus Groups Would Produce As Many Ideas As 10 Individual Interviews.

Participants

A Random Sampling Technique Was Used In The Recruitment Of The Participants. The Candidate Participants Were Special Education Employees With Experience In Public Primary And Secondary Education And Worked In Mainstream And Special Schools Of The Geographical Area Of Thessaloniki. Prior To The Focus Group, 15 Candidate Participants Were Individually Interviewed By Telephone With Regard To Some Demographics And Their Work Experience. Telephone Screening Interviews With Potential Participants Were Conducted A Month In Advance And A Very Short Questionnaire Was Used To See If The Candidate Participants Fit The Recruitment Strategy And If They Were Interested In Participating. The Telephone Screening Interviews And The Final Group Composition Of Participants Ensured That They Had Something To Say About The Research Topic And They Felt Comfortable Saying It To Each Other. The Focus Group Was Composed Of Eight People Who Did Not Know Each Other (Krueger & Casey, 2000; Morgan, 1997). Participants Were Similar To Each Other In A Way That Was Important To The Researchers And Served Focus Groups' Aims. The Focus Group Was Characterized By Homogeneity In The Sense That All Participants Were Public Sector Employees Who Work With Children With Special Needs. Besides, The Focus Group Was Characterized With Sufficient Variation Among Participants Concerning Mainly The Specialization, The Structures And The Work Experience, And The Employment Relationship. From The Seven Participants That Finally Took Part In The Focus Group, Six Were Females And One Was Male. There Were Three Participants That Belonged To The Age Group Of 41-50, Three That Belonged To The 30-40 Age Group And One That Was Under The 30 Years Old. All Of Them Had Special Education Studies, Whereas One Of Them Had Also A Two Years Reeducation In Special Education And Two Had Additionally A Master's Degree And A Phd. The Focus Group Consisted Of Four Special Education Teachers, Two Special Teaching Staff And One Kindergarten Teacher. With Regards To Teaching Experience, One Of The Participants Had Two Years In Special Education, For Five Of Them The Work Experience Varied Between 8 And 16 Years, While One Had 21 Years In Education, 8 Of Which Were In Special Education And 13 In General Education. With Respect To Their Current Position, Five Were In Primary Education, One Was In Secondary Education And One In Hospital School. Finally, Three Participants Had A Permanent Employment Relationship And Four A Temporary.

Instruments And Procedures

A Written Plan Was Developed And Included The Focus Group Purpose, A Background Information On Rewards And Motivation, The Conceptual Framework, A Plan Of Action, The Participants Information, The Research Team And A Questioning Route. A Brief Written Plan Was Send To The Participants Before The Focus Group Meeting And The Importance Of The Study And Their Participation Were Highlighted. Doing Something Like This Before Coming To The Focus Group Helps The Participants Prepare For The Group Discussion (Krueger & Casey, 2000). The Meeting Was Organized, Regarding The Day, The Time And The Location, So As To Be Convenient For The Participants And The Research Team. The Invitations Were Personalized, So As Each Participant To Feel That They Were Personally Needed And Wanted At The Interview And Their Participation Would Be Of Value In The Study. A Pilot Application Of The Questioning Route Preceded. An Introduction Opened The Meeting Which Included A Welcome, An Overview Of The Topic And The Ground Rules. The "Funnel" As A Compromise Approach Was Used, Which Is A Compromise Between Structured And Less Structured Approach (Morgan, 1997). The Focus Group Begun With A Less Structured Approach That Emphasized Free Discussion And Then Moved Toward A More Structured Discussion Of Specific Questions. The Questioning Route Was Arranged In Natural, Logical Sequence. More Specifically, Questions Moved From Broad And General To More Specific And Of Greater Importance To The Study And Were Categorized As Opening, Introductory, Transition, Key And Ending Questions. Clear, Simple, Easy To Say, And Open - Ended Questions Were Mainly Used For The Questioning Route. Questions That Engage Participants Were Also Used Such As Rating Items And Listing Things (Krueger & Casey, 2000), Whilst "Think-Back" Questions Were Preferred To Encourage Participants To Share Personal Experiences. The "Funnel"

Compromise Made It Possible To Hear The Participants' Own Perspectives In The Early Part Of The Discussion As Well As Their Responses To The Researcher Specific Interests In The Later Part Of The Discussion (Morgan, 1997).

The Focus Group Lasted About Two Hours As It Was Planned (Krueger & Casey, 2000). It Was Recorded In Three Ways: By A Tape Recorder, A Camera And With Written Notes. The Principal Mean Of Capturing Observations In A Focus Group Is Through Audio Taping (Morgan, 1997). Although Videotaping Is Very Little Recommended For Social Science Research (Krueger & Casey, 2000; Morgan, 1997), It Was Used To Ensure That Everything Was Recorded, To Determine Who Is Speaking And To Whom, And To Capture Facial And Nonverbal Details. During The Meeting, The Research Team's Involvement Was Moderate. The Goal Was To Create A Comfortable And Permissive Environment That Encouraged Participants To Share Perceptions And Points Of View And Interact With One Another, Without Pressuring Participants To Reach Consensus. The Interviewer Was Careful Not To Make Judgements About The Responses And To Control Body Language That Might Communicate Approval Or Disapproval. The Interviewer Also Tried To Give The Appearance Of Active Listening.

At The End Of The Focus Group, The Participants Were Asked To Complete The Motivation At Work Scale (MAWS). Particularly Were Asked To Indicate For Each Of The 12 Statements Of MAWS To What Degree They Presently Correspond To The Reasons They Are Doing This Specific Job, In A Scale From 1 (Not At All) To 7 (Exactly). The MAWS Was Developed With The Multidimensional Conceptualization Of Motivation Postulated In Self-Determination Theory (SDT). SDT Allows The Assessment Of Level And Type Of Motivation And Proposes Two Overarching Types Of Motivation: Intrinsic And Extrinsic. It Is A Dominant Theory Of Motivation In Social And Education Psychology Which Has Yielded Hundreds Of Empirical Publications Since The Early 80's (Gagné Et Al., 2010). Central To SDT Is The Distinction Between Autonomous Motivation And Controlled Motivation. Autonomous Motivation And Controlled Motivation Are Both Intentional And Together They Stand In Contrast To Amotivation, Which Involves A Lack Of Intention And Motivation (Gagné & Deci, 2005; Ryan & Deci, 2000). According To MAWS, Motivation Is Consistently Organized Into Four Types: Intrinsic Motivation, Identified Regulation, Introjected Regulation And External Regulation. As (Gagné Et Al., 2010) Mention:

Intrinsic Motivation Is Defined As Doing Something For Its Own Sake Because It Is Interesting And Enjoyable. *External Regulation* Refers To Doing An Activity To Obtain Rewards Or Avoid Punishments. *Introjected Regulation* Refers To The Regulation Of Behavior Through Self-Worth Contingencies Such As Ego-Involvement And Guilt. *Identified Regulation* Refers To Doing An Activity Because One Identifies With Its Value Or Meaning, And Accepts It As One's Own, Which Means That Is Autonomously Regulated. (P. 629)

Findings

The Meeting Of Focus Group Was Followed By The Video And Recording Transcription And The Data Analysis. Regarding Data Analysis, Two Stems Were Followed:

- *Qualitative Data Retrieval Of Focus Group*: It Included The Thematic / Topic Coding Of Data, The Indexing Of Qualitative Data Codes In Categories And The Cross Referral Of The Different Categories Of Qualitative Data
- *Focus Group Data Analysis*: It Included The Data Reduction, The Data Display And The Conclusions (Drawing And Verification) Which Took Place Before, During And After The Collection Of Qualitative Data (Miles & Huberman, 1994).

The Findings From The Focus Group With Special Education Staff Can Be Summarized Under Seven Major Headings Which Are:

- a. Motivation At Work
- b. The Importance Of Rewards At Work
- c. Rewards For Special Education Staff
- d. Rewards Not Included In The Conceptual Framework
- e. Important Rewards For Motivation
- f. Focus Group Clue
- g. Motivation At Work Scale (MAWS)

a. Motivation At Work

Motives For Profession Choice

Regarding Motivation At Work The First Question Had To Do With What Had Motivated Them To Choose The Specific Profession. In The Majority Of The Comments (6 Out Of 7 Participants), The Emphasis Was On The Conscious Choice Of Special Education, A Choice That They Did Not Regret, And Illustrated With Examples Such As The Following:

“Special Education Was A Very Romantic Choice. I Did Not Regret It”
“I Entered Special Education Which Always Had Some Appeal For Me...After 11 Years In General Education”
“It Was My First Choice...After A Visit To An Institution With People With Disabilities”
“I Entered Special Education Very Consciously. It Was My First Choice ...I Vividly Wanted It”
“My Big Love Was The Learning Difficulties, The Dyslexia ... So It Was A One-Way Street For Me, The Special Education And The Area Of Learning Difficulties”
“It Was Something I Really Liked. I Felt Like Contributing And I Could Change Things Through This Process”

A Participant Admitted That They Did Not Know The Area Of People With Disabilities, And Although This Was Chosen By Chance, It Was A Challenge And They Were Satisfied With This Choice.

Ease Or Difficulty To Motivate And Be Motivated: Factors That Affect It

As Far As Concerns The Ease Or Difficulty To Motivate And Be Motivated In Public Special Education, Although The Difficulty Was Emphasized, Some Ways To Succeed It Were Mentioned. These Had To Do With Passion, Good Mood, Core Values, Relationship With Colleagues And Recognition. The Following Examples Illuminate The Participants Point Of View:

“It Is Not So Easy To Motivate In Public Sector”

“It's Not Easy At All. But It Can Be Done ... And It's Done. Besides Me, It Needs Passion And Good Mood. In Public Schools You Don't Have All The Resources That You Need...There Are Many Shortcomings, Especially For Us Who Work As Integration Class Teachers And Each Year We Are In A Different School And Many Times We Should Prepare Everything From The Beginning”

“I Think Even Money Is Not An Incentive In Special Education. It's A Choice That Either You Want It Or Not. For Me A Motivation Was The Climate That Existed, It Was The Colleagues. I Was Fortunate To Work With Amazing People ... People Who Were Altruistic ...This Fulfills Me”

“In Public Sector Anyone That Does Not Want To Be Motivated, Can't Be Motivated In Any Way. Especially In Special Education, If You Didn't Choose It Because You Want It And You Chose It For Any Other Reason, You've Better Don't Go. If You Want, You Can Find Things That Motivate You”

“No Matter How Strange It Sounds...The Appreciation And Recognition That I Have Received From Parents And Children Was So Big”

“I Think There Is An Important Part... That You Can Actually Find Some People Around You To Work Together, Who Seem To Have Mood And Try...And Love It Anyway ... And They Are Motivated By Some Values. If There Was Collectivity, Which I Think Does Not Exist, This Would Have Made Me Work Better And With More Motivation. If There Were Collective Processes, Communication And Feedback...”

From The Focus Group We Draw Also Conclusions For The Factors That Affect Employee Motivation. These Factors Had Mainly To Do With Intrinsic Motivation And Work Environment. The Conscious Choice Of Special Education, The Passion And The Good Mood For The Job Itself, The Devotion To Special Education And The Personal Values Were The Incentives Mentioned That Intrinsically Motivate Them. The Significance Of Devotion To The Area Of Special Education And The Conscious Choice Of The Profession Were Highlighted By All The Participants. Factors That Had To Do With The Work Environment And Are Highlighted As Important For Their Motivation Were The Recognition From Parents And Children, The Relationship With Coworkers, The Organizational Climate, The

Collectivity, The Communication And The Feedback, And The Available Resources To Do Their Work In The Best Way.

b. The Importance Of Rewards At Work

Recognition Of Contribution -Rewards

With Regard To Their Feelings To Be Recognized And Rewarded For Their Contribution At Work, Participants Expressed Themselves Without Hesitation. Most Of The Participants Expressed Their Satisfaction For Their Work Recognition. Examples Are Given Below:

"I Think An Employee In Special Education Has So Many Reasons To Feel Lucky And That He/She Is Really Rewarded. So Even The Financial Rewards Count And The Fact That A Little Step That A Child Did, Will Raise You To The Heavens"

"I Believe That In Special Schools, Your Contribution Is Recognized. It Is Acknowledged But This Happens Slowly Because It's The Kind Of Work...That You Have To Do With A Specific Social Group Of Children. I Believe That The Greatest...The Most Important Reward, At Least For Me, Is The Slightest Student's Progress You See Because The Financial Rewards Do Not Exist. It Is Even When The Child Sits Down And Catches A Bottle To Pick It Up...This Can Change Your Whole Day. And Then You Say To Yourself: So, I Did Well That I've Chosen Special Education ...I Do Not Mind That There Are No Plasticines"

"I Want To Say That In Hospital Schools The Satisfaction Is Enormous. For The Financial Rewards Apply The Same As In Other Structures Of Special Education. But...In A Hospital School Satisfaction Is Immediate. Playing Even A Jigsaw Puzzle With A Child, The Smile, The Joy, That They Have Escaped From The Healing, That They Feel Like Being In A School Environment, That They Have Forgotten Their Illness. And, Also, The Joy Of The Parents Themselves"

Moreover, It Was Highlighted The Possibility For The Special Education Employees To Experience Some Difficult Situations And Problems (For Example Problems With Parents And Colleagues) That Can Disappoint Them And Make Them Feel That Their Contribution Is Not Recognized. An Example Follows:

"I Believe In Special Education You Feel Very Often...That You Are Not Rewarded. There Are Days That Something Went Wrong...Something With The Parents Mainly, Something With A Colleague, A Problem In The School...And Then You Say: It Is Not Worth It. We Feel That We Don't Get Back, That The Results Are Coming Very Slowly. When You Feel Rewarded ... You Do It Better"

c. Rewards For Special Education Staff

Through The Focus Group, The Rewards That Were Provided In Their Work Environment Were Identified.

Pay

With Respect To **Pay** Rewards, Apart From **Base Pay**, **Contingent Pay**, Which Is Connected With Required Qualifications, Years Of Work Experience, Studies And Children, Was Mentioned As A Reward Provided For Both Categories Of Employees, Permanent And Temporary. The Allowances Were Included In This Reward As Well. Respecting **Educational Incentive Pay**, This Is A Reward That Could Be Provided Only To Permanent Public Employees And Not To The Temporary. An Example Follows:

"There Is A Difference Between Permanent And Temporary Employees. There Is Not Any Educational Incentive Pay That Your Employer, Your Organization Pays For You...With Regards To Temporary Employees"

One Of The Participants Highlighted A Personal Experience:

"My Employee, Public Sector I Mean, Paid 2 Years For My Training, My Studies. And This Was Very Important For My Career Development. I Don't Know If I Could Have Done This By My Own"

Benefits

Among The Benefits Mentioned And Discussed During The Focus Group There Was The **Pay For Time Not Worked**. This Includes The Holidays, The Vacations, The Paternity/Maternity Leave, The Marriage Leave, The Regular Leave, The Personal Leave, The Funeral Leave, The Time Off To Vote, The Blood Donation, And The Sabbatical Leave, All Of Which Are Benefits Provided To All The Participants For Time Not Worked. With Reference To The Sick Leave And The Family Illness Leave, The Temporary Employees That Participated Agreed That There Is Not An Equal Treatment Between Them And The Permanent Staff And They Don't Actually Enjoy This Privilege. An Illustration Is Given Below:

"There's A Major Sticking Point For The Temporary Employees. If We Get Sick We'll Lose Half Of The Day Wage... And If We Take The Day As A Regular Leave We'll Lose A Whole Day Wage From The Unpaid Leave Allowance We Get In The End Of Each School Period...In The Summer. Which Means That We Can't Get Sick"

In Relation To The Lunch And Rest Periods, Most Participants Agree That They Have Some Free Time During A Work Day. A Representative Example Is The Following:

"The Break Is The Same For The Whole School, And If You Are Not On Duty, It Is Actually Your Free Time To Eat, To Go To The Restrooms Etc., Regardless That Anybody Can Ask For Your Help During The Break"

Somewhat In Contrast, It Was Strongly Mentioned That The Special Assistant Personnel Can't Actually Have A Break And Enjoy This Benefit. An Example Follows:

"The Special Assistant Personnel Can't Have A Break For Lunch And Rest As We Have To Be All The Time With The Child We Assist...Also During Its Break For Food. You Can't Even Go To The Restrooms...Unless You Have A Good Colleague- Teacher Who Wants To Help You And Take Care Of The Child For 5 Minutes"

Other Benefits That Are Provided Are The Following:

Health And Accident Protection: It Includes Medical, Hospital And Surgical Insurance-For Self And Dependents- Resulting From An Accident Or Illness, Prescription Drugs, Daily Maternity Allowance, One-Off Childbirth Allowance, Etc.

Loss-Of-Job Continuation: It Includes Unemployment Insurance, Severance Pay, Etc.

Disability Income Continuation: It Includes Short-Term Disability, Sickness And Accident (S & A), Long-Term Disability (LTD), Etc.

Perks: They Include I) **Flexible Perks** Such As Unpaid Leave, Half-Day Occupation, Ii) **Other Perks** Such As Parking, Transportation To And From Work-Commuting Assistance, Free Entrance To Museums And Archaeological Places, Tickets To Entertainment Events

Among The Benefits Recognized By All The Participants Were Also The **Pension Programs. Job Security**, As A Benefit, Mentioned, As It Was Expected, Only By The Permanent Employees.

Learning & Development

Regarding **Education**, Most Of The Permanent Employees Recognized The Training Opportunities They Have To Acquire New Knowledge And Develop Skills, Whereas The Employee Of The Hospital School Highlighted That No Education Is Provided Regarding Hospital Schools:

"There Is No Education For Hospital Schools"

Among The Participants With Temporary Employment Relationship There Was A General Agreement That Not Enough Training Opportunities Exist For Them And In Some Cases This Only Happens After The Employees' Personal Initiative. The Development Of Work And Personal Skills And Knowledge With The Help Of The Boss And Colleagues (**Workplace Learning & Development**) Was Acknowledged By All The Participants As A Reward. With Reference To The **Performance Management** Some Participants Emphasized The Need For Specific Performance Goals And Expected Results, And Others The Significant Factor Of Constructive Feedback. It Is Worth Noting That In Many Cases The Available Resources (Time, Knowledge, Skills, Human Resources, Physical And Technical Means) Are Not Enough For The Best Performance Management. In Relation To **Career Development**, It Was Acknowledged That There Are Career Prospects And Opportunities For Career Development In Public Special Education But These Are For Few Available Positions And Not For The Temporary Staff.

Work Environment

What The Findings Suggest Is That The Rewards Which Are Related To The Work Environment Vary According To The School, Where The Special Education Staff Will Be Assigned To Each Year. There Was A Consensus Among Participants That There Is A Differentiation From School To School, From Year To Year. Among The Rewards Mentioned In Relation With The Work Environment Were The Following:

Core Values: They Include The Employment In An Organization With A Distinct And Good Profile And The Identification With The Organization's Values

Leadership: It Includes A Supportive And A Flexible Leadership That Inspires Trust And Faith To Others With The Power And Enthusiasm Of A Vision, A Leadership That Gives A Sense Of Purpose And Pride, A Leadership That Manages Through Goals And Offers Constructive Feedback On The Results Of The Work. Some Examples Are Given Below:

“The Director Plays A Very Important Role...The Director Should Also Be A Leader. It Is So Difficult For Someone To Be A Good Director And Inspire The Whole Staff”

“The Person Always Plays A Role. There Are Directors Who Have No Ears To Hear, There Are Others Who Have”

Relationship With Colleagues: It Includes A Good Cooperation With Colleagues, A Constructive Social Relationship With Colleagues, An Environment Where Trust, Friendship, Teamwork, Loyalty Exist With Respect To An Environment Where Trust, Friendship, Teamwork, Loyalty Exist, The Majority Of The Participants Referred That It Can't Be Found Totally. One Of Them Distinctively Mentioned:

“It Does Not Exist In All Levels. I Believe That This Could Have Been A Very Important Incentive”

Autonomy And Initiative: It Includes The Flexible Work Scheduling, The Freedom Of Movement In The Workplace, The Adequate Control Of The Job, The Sense Of Responsibility Of Work Results

Recognition And Reward: It Includes The Recognition And The Reward Of The Employee As A Useful And Valuable Contributor, The Recognition Of Good Performance And Offer

Employee Voice And Participation: It Includes The Provision Of Opportunities For Participation In Decision-Making Processes, The Employee Voice On How To Perform The Work

Two Significant Factors Mentioned That May Affect The Employees' Voice In The Organization. These Were The Work Experience And The Employment Relationship (Temporary And Permanent). An Example Can Be Found In The Following Statement Of A Participant With Temporary Employment Relationship:

“I Want To Emphasize Something That I Feel Very Strongly. When You Are One Year In This School And One Year In Another You Can't Have Voice. Now That I Am 5 Years In The Current School, I've Started To Speak And To Be Heard. In The First Year I Did Not Speak For Myself, In The Second Year I Was Speaking Just A Little Bit More ...In 5 Years I Can Speak And I Feel Confident. But They Do Not Easily Give Voice To A Temporary Employee”

Interesting And With Variety Work: It Includes An Interesting And Important Work, A Work With Variety And Many Challenges, A Work That Requires Sufficient Attention And Effort, A Meaningful Work

Safe And Enjoyable Work Environment: It Includes A Safe And A Pleasant Work Environment That Minimizes Work-Related Stress And Pressure. A Good Example Is Given Below:

“I'm In A Kindergarten And It's Really Very Pleasant. I Have A Lot Of Fun”

Somewhat In Contrast, The Employee Of The Hospital School Questioned The Existence Of An Enjoyable Work Environment As A Reward:

“The Hospital Environment Is Not Pleasant, Not At All Pleasant, It Is Arduous”

d. Rewards Not Included In The Conceptual Framework

Through The Focus Group, Two Rewards That Were Not Included In The Conceptual Framework Were Determined. Both Of Them Were Related To The Work Environment And Are Described Below.

Psychological And Emotional Rewards: These Are Rewards With Respect To The Relationship With Children And Parents And Include The Contact With The Child (For Example A Smile, A Hug), The Child Development, The Moral Satisfaction For The Provided Help To Children And Parents

Collectivity: It Includes Frequent And Diffused Collective Processes Of Pedagogical Practices And Pedagogical Policy

The Importance Of These Rewards Was Highlighted By The Majority Of The Participants.

e. Important Rewards For Motivation

Through The Focus Group, The Rewards That Were Important For Them And Their Motivation Were Identified. The Findings Support The Notion That The Aspects Of Conceptual Research Framework That Concern The Work Environment Are The Rewards Which Are The Most Important For Their Motivation, Followed By Those That Concern Learning And Development And Benefits (Table 1).

Table 1: Rewards In Order Of Priority

Total Reward Aspects	Rewards In Order Of Priority	Illustrations
Work Environment	Psychological And Emotional Rewards	<i>"Relationship With Children And Parents"</i> (4 Participants) <i>"Child Development"</i> (4 Participants) <i>"Moral Satisfaction"</i> (4 Participants) <i>"A Smile, A Hug"</i> (3 Participants)
	Safe And Enjoyable Work Environment	<i>"Pleasant Work Environment"</i> (1 Participant) <i>"Enjoyable Environment-Pleasant"</i> (1 Participant)
	Relationship With Colleagues	<i>"Collaboration With Active And Hearty Colleagues"</i> (2 Participants)
	Collectivity	<i>"Frequent And Diffused Collective Processes Of Pedagogical Practices And Pedagogical Policy"</i> (1 Participant)
	Recognition And Reward	<i>"Employee's Work Recognition"</i> (1 Participant)
Learning & Development	Performance Management	<i>"Available Resources"</i> (2 Participants)
	Education	<i>"Educational Opportunities"</i> (1 Participant)
	Workplace Learning And Development	<i>"Workplace Learning And Development: Training Policies For Hospital Schools"</i> (1 Participant)
Benefits	Job Security	<i>"Stable Work Environment"</i> (2 Participants) <i>"Permanent Employment Relationship"</i> (1 Participant) <i>"Job Security"</i> (1 Participant)
	Pay For Time Not Worked	<i>"Work Benefits (Pay For Time Not Worked, For Example Sick Leave)"</i> (1 Participant)
Pay	Base Pay	<i>"Salary"</i> (1 Participant)

	Contingent Pay	<i>"Maybe An Allowance For The Summer, When We Do Not Work" (1 Participant)</i>
--	----------------	---

Regarding Work Environment The Most Important Rewards For Participants Motivation Had To Do With The Psychological And Emotional Rewards, The Safe And Enjoyable Work Environment, The Relationship With Colleagues, The Collectivity, The Recognition And Reward. With Respect To Learning And Development The Most Important Rewards For Their Motivation Were Related To The Performance Management, The Education And The Workplace Learning And Development. As Far As Concerns The Benefits, They Had To Do With The Job Security And The Perks. The Less Important Rewards Were Those Connected To Pay, Such As The Base Pay And The Contingent Pay.

f. Focus Group Clues

The Focus Group Finished By Asking Each Participant To Reflect On What They Considered To Be The Most Important Issue That Had Emerged From The Discussion. These Clues Can Be Summarized, According To The Frequency That Were Mentioned By The Participants, As Follows: The Very Positive Experience Of Participating In The Focus Group, The Passion, The Devotion And The Conscious Choice Of Special Education, The Difficulties Of Working In Special Education, The Consistency Of Views And Values For Special Education Staff.

g. Motivation At Work Scale (MAWS)

The Descriptive Statistics (Minimum, Maximum, Mean And Standard Deviation) For Each Subscale Of MAWS Can Be Found In Table 2. According To The Results, Intrinsic Motivation And Identified Regulation Have Scored High, Whereas Introjected And External Regulation Proved To Be Less Important For The Participants, Regarding The Reasons They Are Doing The Specific Job. Specifically, Intrinsic Motivation Of The Participants Proved To Be Almost Very Strong (Mean 5.9), The Identified Regulation Was Between Strong And Very Strong (Mean 5.3), Whereas Identified And External Regulation Were Found To Be Between Low And Moderate (Mean 3.42 And 3.47 Respectively). Regarding The Total Descriptive Statistics Of The 12 Statements Of MAWS For All The Participants, The Mean Was 4.55 (Between Moderate And Strong), With Minimum And Maximum 3.5 And 5.25 Respectively, While The Standard Deviation Was .60.

Table 2: Descriptive Statistics For Each Subscale Of MAWS

	N	Minimum	Maximum	Mean	Std. Deviation
Intrinsic Motivation	7	5.33	6.67	5.9048	.49868
Identified Regulation	7	3.67	6.33	5.3810	.84828
Introjected Regulation	7	2.00	5.00	3.4286	1.18187
External Regulation	7	2.33	4.00	3.4762	.71640

Below Are Presented The Participants Answers In The Four Subscales Of MAWS: Intrinsic Motivation, Identified Regulation, Introjected Regulation And External Regulation. The Answers To The 12 Statements (3 For Each Subscale) Ranged From 1 (Not At All) To 7 (Exactly) Concerning The Degree That The Statements Presently Correspond To The Reasons They Are Doing This Specific Job.

Intrinsic Motivation

The First Three Statements Of The MAWS Concerned Intrinsic Motivation:

<i>Intrinsic 1</i>	Because I Enjoy This Work Very Much
<i>Intrinsic 2</i>	Because I Have Fun Doing My Job
<i>Intrinsic 3</i>	For The Moments Of Pleasure That This Job Brings Me

The Answers Varied From Strongly (5) To Exactly (7). The Majority Of The Participants Chose Very Strongly (5) For These Statements, Followed By Strong (5) And Exactly (7). The First Statement (*Intrinsic 1*) Has Scored Higher (Mean 6.28) Than The Other 2 Statements Of The Subscale.

Identified Regulation

The Statements From 4 To 6 Concerned Identified Regulation:

<i>Identified 1</i>	I Choose This Job Because It Allows Me To Reach My Life Goals
<i>Identified 2</i>	Because This Job Fulfills My Career Plans
<i>Identified 3</i>	Because This Job Fits My Personal Values

The Answers In This Subscale Varied From Very Little (2) To Exactly (7). The Majority Of The Participants Answered Very Strongly (6), Followed By Strongly (5). The Participant That Answered Very Little (2) And Little (3) In The Statements 4 (*Identified 1*) And 5 (*Identified 2*) Respectively, Belonged To The Special Teaching Staff Who, According The Results, Does Not Have Many Opportunities For Education And Development. The Sixth Statement (*Identified 3*) Has Scored Higher (Mean 6.14) Than The Other 2 Statements Of The Subscale.

Introjected Regulation

The Statements From 7 To 9 Concerned Introjected Regulation:

<i>Introjected 1</i>	Because I Have To Be The Best In My Job, I Have To Be A "Winner"
<i>Introjected 2</i>	Because My Work Is My Life And I Don't Want To Fail
<i>Introjected 3</i>	Because My Reputation Depends On It

In This Subscale A Greater Dispersion Is Found In The Degree That The Statements Presently Correspond To The Reasons They Are Doing This Specific Job. The Answers Varied From Not At All (1) To Very Strongly (6), Whereas No Exactly (7) Answer Was Given. The Majority Of The Participants Answered Moderately (4) In The Statements Of This Subscale. The Eighth Statement (*Introjected 2*) Has Scored Higher (Mean 4) Than The Other 2 Statements Of The Subscale.

External Regulation

The Statements From 10 To 12 Concerned External Regulation:

<i>External 1</i>	Because This Job Affords Me A Certain Standard Of Living
<i>External 2</i>	Because It Allows Me To Make A Lot Of Money
<i>External 3</i>	I Do This Job For The Paycheck

In This Subscale Likewise, A Great Dispersion Is Found In The Degree That The Statements Presently Correspond To The Reasons They Are Doing This Specific Job. The Answers Varied From Not At All (1) To Strongly (5), Whereas No Very Strongly (6) And No Exactly (7) Answer Were Given. The Majority Of The Participants Answered Moderately (4) In The Statements Of This Subscale. The Tenth Statement (*External 1*) Has Scored Higher (Mean 4.43) Than The Other 2 Statements Of The Subscale.

MAWS Results Correlation With Focus Group Results

According To The Participants Statements It Is Not Very Easy To Be Motivated In Public Special Education, Which Is Strengthened By An Almost Moderate Mean (4,55) In MAWS Total Results For Their Motivation. Participants Are Mainly Intrinsically Motivated By Their Passion, Their Good Mood And Their Devotion To Special Education And The Choice Of The Profession Came Consciously. According To The MAWS Results, Intrinsic Motivation, Which Has To Do With A Likeable And Entertaining Job With Moments Of Joy, Was Strong For All The Participants (Mean: 5,9). Financial Incentives Were Not Included To The Factors That Can Affect Their Motivation, Something That Is

Confirmed By The Low Mean Score (3,47) In The Subscale Of External Regulation Which Had To Do With Money And Standard Of Living.

Comparing What Motivated Them To Choose The Specific Profession And What Now Motivates Them To Do The Job They Are Doing Significant, Similarities Can Also Be Found. These Similarities Can Be Identified Between The Participants' Answers About The Motives Of Profession Choice (The Passion, The Good Mood And The Devotion To Special Education) And Their Answers For The Intrinsic Motivation Subscale. Besides, A likeness Can Be Identified Between Their Answers For The Identified Regulation Subscale And Other Motives Mentioned Such As The Conscious Choice Of The Profession, The Career Plans And The Personal Values. This Is Reinforced By The Fact That For All The Participants The Subscales Of Intrinsic Motivation And Identified Regulation Have Scored High. The Latter Can Be Also Compared To The Motives For Profession Choice.

From The Comparison Of MAWS Results With The Important Rewards For Motivation, It Can Be Inferred That The Most Important Rewards For Their Motivation Had Mainly To Do With Their Intrinsic Motivation And Secondly With Identified Regulation. It Is Worth Noting That The Few Rewards That Were Related With External Regulation (Pay) Were Mentioned By The Participants With Temporary Employment Relationship.

Conclusions

This Research Offers An Important Window On The Special Education Staff' Perspectives On Rewards And Motivation At Work Environment. In National Level There Has Not Been Any Similar Study In The Field Of Special Education. The Total Rewards Framework Proved To Be Appropriate And Useful In Understanding The Perspectives Of Special Education Staff On Rewards. Nevertheless, It Is Proposed That A Revised Version Of The Conceptual Framework, That Would Include The Two Rewards That Emerged From The Focus Group Meeting (Psychological And Emotional Rewards, And Collectivity), Should Be Used In Future Studies For Special Education Staff Rewards. Furthermore, The Findings Of This Study Advanced Our Knowledge Of Rewards Provided And Highlighted The Rewards That Can Mainly Affect Their Motivation. In Line With The Results, The Relational Rewards That Concerned Work Environment And Learning And Development Were The Most Important For The Motivation For Both Permanent And Temporary Special Education Employees. The School Environment And The Working Conditions Were Also Very Important Rewards For Other Teachers Of Public Sector In Australia (Ashiedu & Scott-Ladd, 2012). A Dynamic Work Environment That Fosters Creativity Was Highly Valued As An Important Reward In Another Study (Taylor Et Al., 2014). Moreover, The Reward System And The Training Highly Affect Teachers' Motivation In Public Secondary Schools, While The School Environment Should Be Conducive For Them To Ensure Their Motivation, By Providing Them With Adequate Teaching And Learning Resources (Nyakundi, 2012).

Without Exception, All The Participants Were Primary Intrinsically Motivated, And Psychological And Emotional Rewards, Such As Their Relationship With Children And Parents, The Child Development And The Moral Satisfaction For The Help They Provide To Children And Parents, Seem To Be For The Majority Of Them Of Great Importance. Findings Of Two Previous Studies Indicated That Intrinsic Rewards Were Key Factors In Contributing To Teacher Retention And Longevity Within The Profession (Ashiedu & Scott-Ladd, 2012; Taylor Et Al., 2014). In One Of The Previous Mentioned Studies (Ashiedu & Scott-Ladd, 2012) Most Public Sector Teachers, That Participated, Cited Intrinsic Motivators As The Reasons For Joining The Teaching Profession. Moreover, According To Plihal (1982), The Enjoyment Of Elementary School Teachers' Interaction With Students And The Feeling Of Being Instrumental In Students Accomplishments Were The Two Major Types Of Intrinsic Rewards. Intrinsic Rewards, Such As The Fulfillment Of Having Successfully Contributed To Child's Development, Were Also More Important Than The Extrinsic Rewards In Another Study For Teachers (Dilworth, 1991). Additionally, As Stated By Taylor Et Al. (2014) Teachers Had An Innate Desire To Help Children In Their Overall Development And Impact Their Lives In A Positive Way, And They Valued Building Relationships And Making A Difference In The Lives Of Their Students As The Main Rewards Of Teaching.

Financial Incentives Were Not Included To The Factors That Could Affect Their Motivation And Were Not Among The Most Important Rewards For Their Motivation, Whereas A Low Mean Score Was Found In The Subscale Of External Regulation In MAWS, Which Had To Do With Money And Standard Of Living. As Reported By Pinto (2011) There Is No Direct Connection Between Pay And Motivation And As Stated By Dilworth (1991) Teachers Don't Take So Much Satisfaction From The Extrinsic Rewards Such As Compensation And Position.

Finally, The Results Shed Light On The Rewards That The Temporary Staff Can't Actually Enjoy. These Were Not Only Relational Rewards Such As Education, Workplace Learning And Development, And Employee Voice And Participation, But Transactional As Well, Such As Benefits (Sick Leave) And Job Security. Job Security Was The One That Can Be Logically Justified Given The Permanent Nature Of Their Employment Relationship.

The Usefulness Of The Results Lies In The Fact That The Holistic Study Of The Rewards Provided And Their Importance For Motivation Can Give Feedback On Human Resource Management Decision Making Centers, Trade Union Representation, Employers And The Organization Of Curricula And Lifelong Learning. The Study Can, Also, Provide A Perspective For Future Research Through Total Reward Model Long-Term Exploitation.

The Focus Group Composition Proved To Be Satisfactory To Capture The Perceptions, Feelings And Thoughts Of Special Education Staff About Motivation And Rewards In The Work Environment And Satisfied The Study Aims. The Constraint On The Variety Of Specialties Participation Of Special Teaching Staff Could Be Considered As A Limitation Of This Study.

Abstract

The purpose of this study is to examine the mediating role of friend support in relation to motivational self-talk and mental toughness in athletes. The study group consisted of a total of 200 athletes (agemean: 21,08 + 1,44), 113 women (Agemean: 20,47 + 1,61) and 87 men (Agemean: 21,86 + 3,96). The subscales of friendship support, mental toughness scale, subscale of multidimensional social support scale and self-talk Scale's motivational self-talk subscale were used for the collection of research data. Pearson correlation analysis was used first to determine the relationships between the variables, PROCESS macro regression analysis was used to determine the influence of friend support between motivational self-talk and mental toughness in the analysis process of the data. Analyzes were performed at 95% confidence interval and the Sobel z test was used to test whether the mediation was meaningful. SPSS 22.00 package program was used for the analysis of the research. According to research findings, motivational self-talk levels of athletes were found to be positively linear with both friendship support and mental toughness levels. In addition, according to the findings of friendship support, which is the basic hypothesis of the research, about the mediator role of friend support in relation to motivational self-talk and mental toughness, it has been found that the positive effect of motivational self-talk on mental toughness increases with the support of friends. As a result, it can be concluded that the athletic mental toughness is positively correlated with the motivational self-talk levels, friend support can be used to increase motivational self-talk effect in terms of mental toughness performance.

Keywords: *Motivational Self Talk, Mental Toughness, friend support, Athlete*

Introduction

Mental toughness seems to be one of the most significant psychological constructs related to good sports performance, and therefore in recent research, it has become a focus of attention (Bull et al., 2005, Connaughton et al., 2008, Gucciardi et al., 2009, Jones et al., 2007). Although initial research on mental toughness suffers from some natural weaknesses, recent researches are trying to articulate the conceptual concept of mental toughness (Crust, 2008, Jones et al., 2007). Even though some conceptual differences remain unclear, there seems to be a general idea that mental toughness is a multidimensional structure (Gucciardi et al., 2009, Sheard, 2009). Among the basic qualities that characterize mental toughness are many situations, such as dealing with pressure and troubles, getting rid of failures, insisting or being persistent, being insensitive or having an unwavering grasp on self-control (Crust, 2008).

To date, most of the research on mental toughness has been qualitative and aims to clarify some of the early conceptual uncertainties. While qualitative studies lead to a better understanding of what is mental toughness, most of the reported related variables have not yet been supported by the quantitative methods. Moreover, it can be said that the primary focus given to qualitative research is causing that the development of reliable and valid measures of mental toughness is not given enough importance (Sheard, 2009). In the studies on the level of mental toughness, the variables such as high-intensity exercise (Clough et al., 2002), pain tolerance / physical endurance (Crust & Clough, 2005), sports injury rehabilitation (Levy, Polman, Clough, Marchant and Earle, 2006), optimism and coping (Nicholls, Polman, Levy and Backhouse, 2008), Self-talk (Bayköse et al., 2017), and life satisfaction (Şahin et al., 2017) are discussed.

When it is thought that the theoretical foundations of the concept of mental toughness are based on psychological toughness bases (Kobasa, Maddi, and Kahn, 1982), it has been suggested that there are other factors affecting

psychological toughness in the environment and society in which the individual lives. The presence of an adult providing support and social support outside the home is a protective factor for children and adolescents at high risk (Werner and Smith, 1982; 1992; Benard, 1991; Grizenko and Pawliuk, 1994; Gordon and Song, 1994; Gilligan, 2000; Smokowski, Reynolds and Bezruczko, 2000). In this direction, it can be predicted that friend support is related to mental toughness.

In a similar way to this information and findings, it is thought in our research findings that friend support is also one of the protective or supportive factors in the increase of motivational self-talk which is a positive psychological skill about mental toughness.

In this context, our research hypothesis is defined as follows; H1: Friendship support plays a determining role between the motivational self-talk and the mental toughness in the sportsmen.

The research methodology of the research hypothesis, which has been established within the main objective of the research, is explained in detail below.

Method

Research Model

This study is a survey of relational screening types designed to examine the intermediary role of perceived friend support levels between motivational self-talk and mental toughness. Karasar (2009) defined relational screening search models as “research models aimed at determining the presence and degree of change between two or more variables”. This model examines the mediating role of friend support levels in the relation between athletes' motivational self-talk and mental toughness levels. Within the scope of the research, hypothesis models are given below;

Figure 1: *Research Model*

Research group

The research group consists of a total of 200 (Age mean: 21,08 + 1,44) athletes in active sports life, 113 women (Age mean: 20,47 + 1,61), and 87 men (Age mean: 21,86 + 3,96).

Data collection tools

For the collection of research data, the subscale of friendship support of the Multidimensional Scale of Social Support, the Mental Toughness Scale, and the Self-Talk Scale's motivational self-talk subscale was used. In addition, personal information about the athletes was obtained through the personal information form created by the researchers.

Multidimensional Scale of Social Support

Multidimensional Scale of Perceived Social Support (MSPSS) is a recognized social support measure developed by Zimet, Dahlem, Zimet et al., (1988) in the United States and the adaptation, validity and reliability studies in

our country are carried out by Eker and Arkar (1995), Çakır and Palabıyık (1997), Eker, Arkar and Yıldız (2001). MSPSS is a user-friendly, 12-item measure that evaluates the adequacy of social support from three different sources (family, friends and a private person) in a subjective way. It includes three groups of sources of social support, each consisting of four items. Suggested subscale structure includes support from "family", "friend" and "special person". Factor analysis supports the three-factor structure (Kazarian and McCabe, 1991; Zimet et al., 1988; Eker and Arkar, 1995). Internal consistency and test-retest correlations of the scale and subscales are adequate. Three groups forming the sample of the Eker et al's study (2001) consists of a group of 150 people of psychiatry, surgical patients, and regular people. The reliability (Cronbach's Alpha) of the entire sample, MSPSS, was calculated as $\alpha = .89$. In the same study, the internal consistencies of the MSPSS and its subscales were found to be acceptable. Each item on the scale uses a 7-point scale ranging between Absolutely no = 1, Absolutely yes = 7. In the study, subscale scores were obtained by summing the scores of the four items in each subscale, and the total score of the scale was obtained by summing all subscale scores. The high score obtained indicates that perceived social support level is high.

Sports Mental Toughness Questionnaire (SMTQ)

In this study, the Sports Mental Toughness Questionnaire developed by Sheard et al. (2009) was used for research purpose. The adaptation of the Sports Mental Toughness Questionnaire to Turkish culture was conducted by Altıntaş and Koruç (2016). The Sports Mental Toughness Questionnaire is a measure of three subscales (Confidence, Control, and Constancy) consisting of a total of 14 items. Total scale score was used in the study. The scale has a 4-point evaluation system. The lowest score that can be earned from the scale is 14, while the highest score is 56.

Self-Talk Questionnaire (STQ)

In this study, Self-Talk Questionnaire developed by Zervas et al. (2007) was used for research purpose. The adaptation of the Self-Talk Questionnaire to Turkish culture was carried out by Engür (2011). The Self-Talk Questionnaire is a measure of two sub-scales (Motivational and Cognitive) consisting of a total of 11 items. Only the motivational self-talk subscale was used in the study. There is a total of 7 items on the motivational self-talk subscale. The scale has a 5-point evaluation system. The lowest score that can be taken from the scale is 7 while the highest score is 35.

Personal information form

In the personal information form created by the researcher, questions were selected to obtain information on the age and gender of the athletes participating in the survey.

Data Analysis

In the data analysis, Pearson correlation analysis was used first to determine the interrelationships of the variables with each other, and PROCESS macro regression analysis was used to determine the influence of friend support on motivational self-talk and mental toughness.

Findings

Table 1: The relationship between friend support, motivational self-talk, and mental toughness

		Motivational Self Talk	Mental Toughnes	Friend Support
Motivational Self Talk	Pearson Correlation	1		
	p			
	n	200		
Mental Toughness	Pearson Correlation	,577**	1	
	p	,000		
	n	200	200	
Friend Support	Pearson Correlation	,219**	,276**	1
	p	,004	,001	
	n	200	200	200

** . Correlation is significant at the 0.01 level (2-tailed).

When Table 1 was examined, it was found that the relationship between friend support and motivational self-talk ($r: .219$) was significant ($p < 0.05$), that the relationship between friend support and mental toughness ($r: .276$) was significant, and that the relationship between mental toughness and motivational self-talk ($r: .577$) was significant ($p < 0.05$).

Research Model

Figure 2: The Mediating Role of the Athletes' Perceived Levels of Friend Support in the Relationship Between Motivational Self-talk and Mental Toughness

Determining that there is a meaningful and positive relationship between motivational self-talk and mental toughness enables the testing of the predicted intermediary relationship. PROCESS macro regression analysis was conducted to test whether friend support played a mediating role between motivational self-talk and mental toughness. In the first step of PROCESS macro regression analysis, only the predictive effect of motivational self-talk on friend support was examined, and it is observed that motivational self-talk ($\beta=.35$, $t= 3.15$, $p<.05$) reveals 5% of the total variance for friend support ($R=.22$, $R^2=.05$, $F(1,877) = 9.93$, $p<.05$).

To determine whether friend support plays a mediating role between the motivational self-talk and mental toughness, the predictive influence of motivational self-talk on mental toughness has been investigated in the second stage of PROCESS macro-regression analysis. When findings were examined, it is seen that self-talk ($\beta = .12$, $t = 2.94$, $p < .05$) explains 35% of the level of mental toughness ($R=.60$, $R^2=.35$, $F(0.155) = 9.27$, $p<.05$).

In the third step of the PROCESS macro-regression analysis, to determine whether friend support plays a mediating role between motivational self-talk and mental toughness, friend support added in the PROCESS macro-regression analysis and it was found to contribute 5.4% to the explanation of mental toughness. In this respect, it was found that the friend support explained 36% of the total variance in the determination of mental toughness through friend support ($R = .60$, $R^2 = .36$, $F(0.155) = 54.616$, $p < .05$). In the third stage of the analysis, the predictive effect of self-talk on mental endurance decreased ($\beta = .30$, $t = 9.26$, $p < .05$). Therefore, it can be said that friend support ($\beta = .22$, $t = -6.73$, $p < .05$) is fully mediator in this relationship. The results obtained from the Sobel z test ($Z = 1.99$, $p < .05$) to determine whether the mediating role of friend support show that this mediating relationship is statistically significant.

Table 3: Findings regarding the direct and indirect effect of friend support on mental toughness

Direct Effect			Effect	S. E	LLCI	ULCI	t	p
Motivational Self Talk	Mental Toughness		.303	.0327	.2386	.3676	9.268	.000
Indirect Effect			Effect	S. E	LLCI	ULCI	t	p
Motivational Self Talk	Friend Support	Mental Toughness	.0192	.0085	.0064	.0414	9.95	.000
Total Effect			.322	.0324	.2584	.3862		
Normal Theory Test for indirect effect								
Effect: .0192		s.e: .0097		z: 1.9878		p: .0468		

Table 5 shows that the total effect of motivational self-talk on the mental endurance (direct effect + indirect effect) is positive ($\beta: 0.303 + 0.0192 = 0.322$) and statistically significant ($p = 0,000$). The Z score (1.9878) for this model is larger than 1.96 and meaningful, so it can be said that the mediator effect exists. Moving from this finding, the hypothesis H1 (friend support has an intermediary role in the influence of motivational self-talk on mental toughness) has been accepted.

Conclusions

This study was a survey of relational screening types designed to examine the intermediary role of perceived friend support levels between motivational self-talk and mental toughness. A total of 200 athletes participated voluntarily in the survey, 113 men and 87 men, who were active in their sports lives. After the research, it was determined that the relationship between friendship support and motivational self-talk was meaningful, the relationship between friend support and mental toughness was meaningful. It was also determined that the relationship between mental toughness and motivational self-talk is significant. When this type of information is examined in the literature, the research findings made by Bayköse et al. (2017a) on the sample of athletes trained in sports sciences show similar results to our research findings.

Based on our research findings, it has been determined that motivational self-talk has a positive effect on total mental toughness and it is statistically significant. According to the results obtained, it can be said that the friend support has a mediator role. Moving from this finding, it has been determined that friend support has an intermediary effect on the influence of motivational self-talk on mental toughness. In these findings, social support has become a major issue in the literature of coping (Andersen & Williams, 1999; Hardy, Richman and Rosenfeld, 1991; Petrie, 1992, 1993a; Smith et al., 1990). Malecki and Demaray (2003) state that overall perceived support or exceptional supportive behaviors or social environment can guard individuals from adverse consequences. In this context, it can be said that this information supports our research results. In other words, it is supported by the findings that friendship support between mental toughness and motivational self-talk is a positive factor. Because of the basic characteristics that characterize spiritual toughness, we have noted that there are many situations, such as dealing with pressure and troubles, getting rid of failures, insisting or being persistent, being insensitive or having an unwavering grasp on self-control (Crust, 2008).

As a result, it can be said that the mental toughness of athletes is positively correlated with the motivational self-talk levels, and the friend support can be used to increase the motivational self-talk effect for the mental toughness performance.

Author Note

This study is the improved version of the oral communication presented at the International Conference on New Horizons in Education, which took place between 18-20 July 2018.

Abstract

This research aims to study components of Multicultural Education management in a Thai private international school, and the development of a Multicultural Education management model at Mataneedol School. This study involved research and development and was split into 3 phases. Phase 1; studied document synthesis and in-depth interviews by seven qualified experts designated for each specific group. Instruments used structured interviews and content analytics. Phase 2; developed a model using best practices from three outstanding schools and Multi-Attribute Consensus Reaching (MACR) by a group of ten experts who selected specific instruments, using best practices study, critical assessment, and content analytics. Phase 3; studied and evaluated the model by putting it into practice at Mataneedol School beginning in the 2nd semester of the academic year 2017. Actioned research using participatory observation, interviews, meeting notes, teachers lesson plans, student appraisal work, and quality of Multicultural Education management 'assessment by using synthesis and quantitative data content, with consideration to process and results dimension, improve data and present Multicultural Education at Mataneedol School, researchers found the following: Multicultural Education management model of an international Thai private school consisted of 7 elements. (1) Vision and commitment to the education of everyone (2) Development of a global curriculum (3) Learning activities focused on the construction of knowledge (4) Creation of a climate conducive to learning, social structure, and culture within the school (5) Teaching based on social justice (6) Prevention of prejudice against the rights and equality of everyone (7) Enhancement of multicultural, collaboration, and student achievement. The relationship between components in the Multicultural Educational management model at Mataneedol School under the schemes enterprise, environment, relationship, and challenge was divided into 7 elements which included 34 practical indicators. The overall quality of Multicultural Education at Mataneedol School is in the ranges of "Most" ($\mu = 4.58$, $\sigma = 0.56$). The overall administrative quality of Multicultural Education of Mataneedol School is in ranges of "Most" ($\mu = 4.57$, $\sigma = 0.58$).

Keywords: *Multicultural Education Management Model, International School, Thai Private School, Mataneedol School*

Introduction

Educational management in schools with students from different ethnic and cultural backgrounds. Most of them cannot meet the needs and the style of learning which varies by race, religion, and culture, resulting in unsuccessful students who suffer in school, both emotionally and socially. This can lead to a lack of suitable life skills and academic achievement. (Jenks, Lee & Kanplo, 2001) Therefore, it is essential that educational institutions and teachers consider an appropriate educational management model in line with the cultural diversity of the learners it serves. It is paramount that students are educated in an environment where democracy, equality, freedom, and justice, prevail and where students feel confident to develop positive ideas. Students should be encouraged to show respect for and acceptance of multicultural differences. (Grant & Ladson – Billings, 1997) All educational establishments should adopt and promote an atmosphere of mutual respect and fairness among its multicultural students. (Banks, 2001)

Education in schools with children from different cultures is called "Multicultural Education", which means that school administrators, teachers, and parents create school and classroom environments which are conducive to learning and aware that racial or ethnic backgrounds, languages, religions, traditions, and lifestyles all affect a student's ability to learn. We must learn to accept cultural differences, without showing prejudice or discrimination. (Yongyaun, et al., 2010) Learning the culture of others in terms of beliefs, values, behaviors, and traditions is an important starting point for peace and harmony among human beings. Educators are of vital importance in preparing the new generation to be ready to live and learn in a multicultural community of different cultures. (Wan, 2006)

Multicultural education in Thailand is required in order that we can comprehensively manage and develop models of multicultural education which are clearly understood in our schools. Administrators and teachers in the education system of the educational reform era, are expected to have the potential to become a significant force within Thai society. Researchers study the components of multicultural education based on the concept of educators, synthesized the elements that can be used as a Multicultural Education management model within the

Thai private school system consisted of 7 elements. **(1) Vision and commitment to education of everyone** (Banks, 1994; Grant & Sleeter, 2003; Ameny-Dixon, 2004; Rios, 2012) **(2) Development of global curriculum** (Banks, 1994, 2001, 2002, 2008, 2016; Grant & Sleeter, 2003; Ameny-Dixon, 2004; Gates, 2006; Rios, 2012; Ford, 2014; Yongyaun, et al., 2010) **(3) Learning activities focused on construction of knowledge** (Banks, 2001, 2002, 2008, 2016; Gates, 2006; Yongyaun, et al., 2010) **(4) Creation of a climate conducive to learning, social structure, and culture within schools** (Banks, 1994, 2001, 2002, 2008, 2016; Grant & Sleeter, 2003; Gates, 2006; Yongyaun, et al., 2010) **(5) Teaching based on social justice** (Banks, 1994, 2001, 2002, 2008, 2016; Grant & Sleeter, 2003; Ameny-Dixon, 2004; Gates, 2006) **(6) Prevention of prejudice against rights and equality of everyone** (Banks, 1994, 2001, 2002, 2008, 2016; Ameny-Dixon, 2004; Gates, 2006; Ford, 2014) **(7) Enhancement of multicultural, collaboration, and student achievement.** (Banks, 1994; Grant & Sleeter, 2003; Ameny-Dixon, 2004; Rios, 2012)

Therefore, the development of a Multicultural Education management model within an international school in the Thai private school system can improve the overall success of student achievement. This is due to the dimension of the viewpoints of school administrators as a guideline for education that is consistent with the development problems within the country, encourage the Multicultural Education management model in context in schools to bring their schools up to the world-class standard, and distributed to schools with a similar context, has applied to develop the students to be good citizens of the future.

The Study

This research aims to show the components of a Multicultural Education management model of an international school in the Thai private school system and the development model of Multicultural Education management at Mataneedol School.

This study included research and development, and was split into 3 phases:

1) Phase 1 was a study of the components of Multicultural Education at international schools in the Thai private school system by incorporating document research and expert interviews. It consists of two steps:

1.1) Synthesis of elements of Multicultural Education by synthesizing the literature and related research. The researcher studied the components of multicultural education based on the concepts of Banks (1994, 2001, 2002, 2008, 2016); Grant & Sleeter (2003); Ameny-Dixon (2004); Gates (2006); Rios (2012); Ford (2014); Yongyaun, et al. (2010), synthesized the elements that can be used as Multicultural Education management model within Thai private schools consisted of 7 elements. (1) Vision and commitment to the education of everyone (2) Development of a global curriculum (3) Learning activities focused on the construction of knowledge (4) Creation of a climate conducive to learning, social structure, and culture within the school (5) Teaching based on social justice (6) Prevention of prejudice against the rights and equality of everyone (7) Enhancement of multicultural, collaboration, and student achievement.

1.2) Feasibility study Multicultural Education management at an international school in the Thai private school system by utilizing in-depth interviews with 7 specific experts and purposive sampling. Instruments used in the research were semi-structured Interviews, using content analysis.

2) Phase 2 was the development of a Multicultural Education management model of an international school in Thai private school system. A study using best practices of organizations which performed well on the subject, and Multi-Attribute Consensus Reaching (MACR), consisting of two steps:

2.1) Study of promotion factors and obstacles, then draft a Multicultural Education management model of an international school in the Thai private school system. By using best practices from a sample of schools in multicultural education was selected to be successful of three specific outstanding schools. Instruments used in this study were interviews, observation, and study document forms used content analysis.

2.2) Development of Multicultural Education management model of an international school in the Thai private school system by using Multi-Attribute Consensus Reaching, selected expert group based on the concept of Kanchanavasi (2003), 10 selected experts were divided into 5 academics and 5 practitioners. Instruments used in this study was an assessment of the importance of Multicultural Education of an international school in the Thai private school system, data were analyzed by using basic statistics such as frequency, percentage, and mean.

3) Phase 3 was an evaluation of the Multicultural Education management model at Mataneedol School, by putting the model into practice at the school, to evaluate the feasibility of using Multicultural Education management model, consists of two steps:

3.1) Examine suitability and feasibility of the Multicultural Education management model at Mataneedol School, using action research methods and putting the model into practice in the first semester of the

Mataneedol school year, by purposive sampling. Operation in the second semester of the academic year 2017, was divided into two loop cycles with 8 steps, 4 steps per cycle.

3.2) Evaluation of Multicultural Education management model at Mataneedol School, used participatory observation, interviews, meeting notes, Teacher lesson plans, examination of student tasks, and evaluation of the quality manuals and the Multicultural Education management model at Mataneedol School. Then synthesize information, improve the Multicultural Education management model at Mataneedol School again, with consideration of process and output dimensions. Data were analyzed using content analysis and basic statistics such as frequency, percentage, and mean.

Findings

1) The Multicultural Education management model of an international school in Thai private school system consisted of 7 elements with 30 indicators; (1) Vision and commitment to the education of everyone, consisted of 4 indicators (2) Development of global curriculum, included 5 indicators (3) Learning activities focused on knowledge construction, included 3 indicators (4) Creation of a climate conducive to learning, social structure, and culture within school, had 5 indicators (5) Teaching based on social justice included 4 indicators (6) Prevention of prejudice against rights and equality of everyone, had 4 indicators (7) Enhancement of multicultural, collaboration, and student achievement, had 5 indicators.

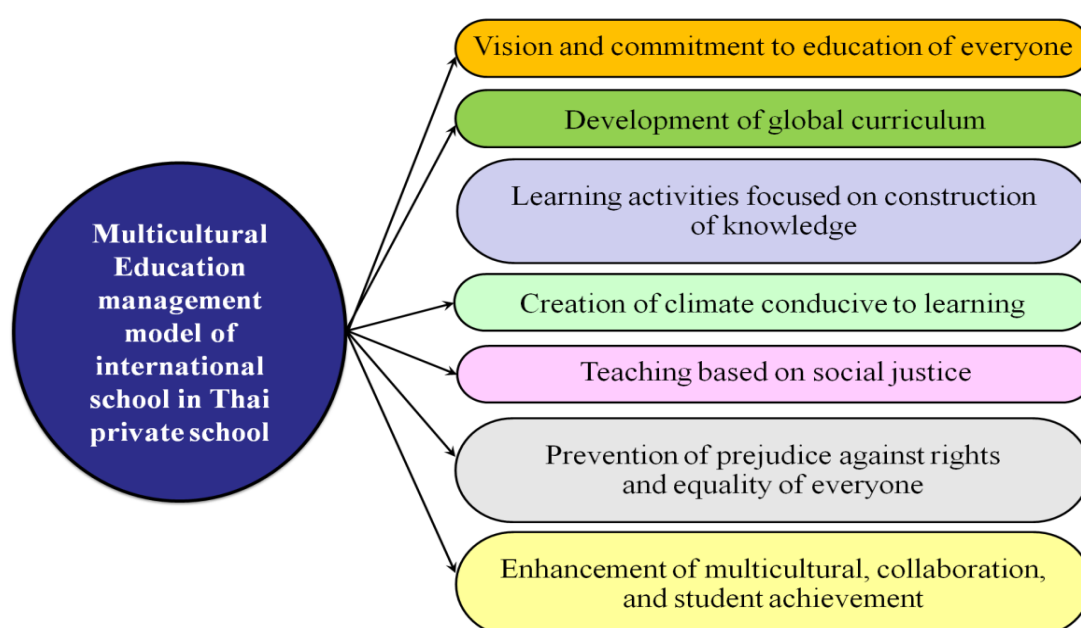

Figure 1: The graphic shows the Multicultural Education management model Of an international school in the Thai private school system.

2) The Multicultural Education management model of an international school in Thai private school system; in each issue had an average score ranging from 88.00 to 98.00 and there was a range of scores between the two experts' groups, i.e. the academic group and the practice group from 0.00 to 16.00. Show that all aspects of Multicultural Education management model was "most important" and had a range different "less".

3) The relationship between components in Multicultural Educational management model at Mataneedol School under schemes enterprise, environment, relationship, and challenge was divided into 7 elements with 34 practical indicators; (1) Vision and commitment to education of everyone, includes 4 indicators (2) Development of global curriculum, includes 5 indicators (3) Learning activities focused on knowledge construction, includes 3 indicators (4) Creation of a climate conducive to learning, social structure, and culture within school, includes 6 indicators (5) Teaching based on social justice, includes 5 indicators (6) Prevention of prejudice against the rights and equality of everyone, includes 5 indicators and (7) The enhancement of multicultural, collaboration, and student achievement, includes 6 indicators.

Figure2: The graphic shows the Multicultural Educational management model at Mataneedol School under schemes enterprise, environment, relationship, and challenge.

The overall quality of Multicultural Education at Mataneedol School are in ranges of “Most” ($\mu = 4.58$, $\sigma = 0.56$). The overall administrative quality of Multicultural Education of Mataneedol School is in ranges of “Most” ($\mu = 4.57$, $\sigma = 0.58$).

Conclusions

1) The Multicultural Education management model of an international school in the Thai private school system consisted of 7 elements. (1) Vision and commitment to education of everyone (2) Development of global curriculum (3) Learning activities focused on knowledge construction (4) Creation of a climate conducive to learning, social structure, and culture within school (5) Teaching based on social justice (6) Prevention of prejudice against the rights and equality of everyone (7) Enhancement of multicultural, collaboration, and student achievement. Because of Multicultural Education' elements were related to six components of the education; (1) purpose (2) curriculum (3) teacher (4) student (5) instructional process and (6) administration. This corresponds to the concept of Banks (1994, 2001, 2002, 2008, 2016); Grant & Sleeter (2003); Ameny-Dixon (2004); Gates (2006); Rios (2012); Ford (2014); Yongyaun, et al. (2010). In addition, seven in-depth interviews were developed following the Hypothesis Model. Mostly, study methodology was used for interviews, surveys, group discussions, etc. The results of the study will be used to determine the components or variables in the model, including the nature of the relationship between the elements or variables, or the sequence of preceding elements in the form. In this stage, the principle of rationality is essential. (Pengsawat, 2010)

2) The Multicultural Education management model of an international school in Thai private school system; In each issue averages a score in the range of 88.00 to 98.00 and there was a range of scores between the two experts' groups, i.e. The academic group and the practice group from 0.00 to 16.00. Reveals that all aspects of the Multicultural Education management model was "most important" and had a range difference "less". Because the model was drafted by studying the Best Practice models of three international schools, to achieve the Multicultural Education management model at Mataneedol School. This is a case study of real situations and problems found whilst developing this Multicultural Education Model, the opinions of experts by interview, group discussions, and case studies of the organization which performs well in the study and is based on the concept of Pengsawat (2010). Then set-up meetings for Multi-Attribute Consensus Reaching (MACR), was used to consider the importance and necessity of the Multicultural Education management model at Mataneedol School by writing a score on the scoreboard. Evaluation scores were based on the concepts of King, et al. (2001).

3) The relationship between components in the Multicultural Educational management model at Mataneedol School under schemes enterprise, environment, relationship, and challenges are divided into 7 elements with 34 practical indicators; (1) Vision and commitment to education of everyone, includes 4 indicators (2) Development of a global curriculum includes 5 indicators (3) Learning activities focused on knowledge construction includes 3 indicators (4) Creation of a climate conducive to learning, social structure, and culture within school, includes 6 indicators (5) Teaching based on social justice, includes 5 indicators (6) Prevention of prejudice against the rights and equality of everyone includes 5 indicators (7) Enhancement of multicultural, collaboration, and student achievement includes 6 indicators. The overall quality of Multicultural Education at Mataneedol School are in ranges of "Most" ($\mu = 4.58, \sigma = 0.56$). The overall administrative quality of Multicultural Education of Mataneedol School is in the ranges of "Most" ($\mu = 4.57, \sigma = 0.58$). Because this phase incorporated an action and a study of the research collaboration within the organization was needed by focusing on the work involved during all stages of research from defining the problem, choosing a solution, and developing the solution. This is inline with String's (1996) concept that participatory action research evaluation was an important tool in creating new knowledge and practical sharing in every step. The concept of Kemmis & McTaggart (1998) was that operational research is a cyclical process of planning, action, observing, and reflecting. Including the evaluation of the quality of Multicultural Educational management model at Mataneedol School in this institution, researchers evaluated their approach to the National Quality Award (TQA). Based on the concept of the National Quality Award Office (2011), a new quality management technique was used in both the business and government sectors.

Suggestions

The suggestions for using the research results are as follows: (1) The Office of the Private Education Commission (ECDC) has proposed the policy on Multicultural Education that is consistent with the developmental problems of the country. (2) Private schools collate research results to help in the future with new elements of Multicultural Education that will fit into the context of international schools in Thailand. (3) School administrators of private schools can utilize research results and use them as a guideline for planning Multicultural Education management in other international schools.

Suggestions for the next research; (1) there should be quantitative research, to help enhance the knowledge and diversity, such as the need to explore, the need for assessment of the structural model, etc. By utilizing the results of this research as a guide. (2) There should a comparative study of the elements of multicultural education in international schools under the Private Education Commission and under the Government Education Commission guidelines for promoting Multicultural Education in international schools should match their organizations in order

to properly develop the policy. (3) They should study the components of Multicultural Education in other international schools. In addition to this research, such as organizational culture Resource management, etc., to gain more relevant factors in promoting Multicultural Education in international schools. (4) There should research on non-institutional organizations, to determine whether each context of the organization has elements of Multicultural Education difference.

Abstract

The purpose of this research was to examine the structural equation model (SEM) of factors that affecting teachers' learning innovation in schools using multi-level methodology. Researchers employed a mixed mode design utilizing qualitative and quantitative methods to collect data. A total of five experts and practitioners were involved in in-depth interview at the first phase to identify the factors that affecting teachers' learning innovation. Qualitative findings from the first phase coupled with the literature reviews assisted researchers proceed to second phase using SEM with a total samples of 1,621 principals and teachers from 416 schools that affiliated to the Thailand Office of Basic Education Commission using multi-stage random sampling technique. Qualitative data was analyzed by using content analysis while quantitative data was analyzed using M-Plus program. A survey was employed at the second phase using questionnaire as an instrument. Findings from the first phase indicated that there are seven primary factors, 26 secondary factors, and 73 indicators of teachers' learning innovation. The quantitative findings indicated that the structural equation model of teachers' learning innovation factors has goodness fit with evident data with $\chi^2 = 1,012.203$, $df = 568$, $p = .052$, $\chi^2/df = 1.801$, $CFI = .953$, $TLI = .932$, $RMSEA = .010$, and $SRMRw = .181$, and $SRMRb = .242$.

Keywords: *Educational policy; professional learning community; self-efficacy; school leadership; teachers' learning innovation*

Introduction

In recent decades, global trends in cultural and economic development have brought forth reforms in the ways teachers design the curriculum (Naz & Murad, 2017). Therefore, teachers are professionals who can think about and look for innovative solutions when they face new problems but not technicians who implement the educational ideas and approaches of others only (Paniagua, 2018). Teachers play a crucial role in the interpretation of an innovative design and its translation to educational practice (Könings, Brand-Gruwel, & van Merriënboer, 2006). It is essential that educational innovations have to recognize the need of teachers' learning because they are the most important agents in shaping education for students and in bringing about change and innovation in educational practices (Bakkenes, Vermunt, & Wubbels, 2010).

Commitment to continuous teachers' learning innovation is crucial for the success of education reform, instructional improvement, and students' achievement (Bae, Hayes, Seitz, O'Connor, & DiStefano, 2016). Current educational policies are more concerned about equality of opportunity for education and employment opportunities for graduates (Teichler, 2004). As a result, Thailand's strategic plan for the Second Decade of Education Reform (2009-2018) has emphasized the importance on the quality of life-long learning among Thai people. Teachers' learning innovation is believed would be a strong foundation to improve the quality of education which in line with the standard and the transformation of the society (Aritatana, Sirisooksilp, & Tang, 2016). This is further supported by Somprach, Tang, and Popoonsak's (2017) study. Somprach et al. found that effective school principals have to foster and manage school cultures to develop collaborative working relationships and support on-going learning for students and teachers. This implies the importance of school leadership to promote teachers' learning innovation.

Owen (2015) interviewed teachers from three innovative case-study schools to investigate whether there are links between students' learning achievement and teachers' learning within professional learning communities. Owen had successfully provided specific examples of professional learning communities learning processes with regard

to co-planning, co-teaching, and co-assessment. Owen's findings revealed that professional learning communities are supported teachers' changes in their teaching practices that relevant to innovative contexts by utilizing the research instruments such as students' work samples and achievement data as well as teachers' observations and self-reports. Furthermore, teachers indicated that their participations in innovative professional learning communities had successfully increased students' learning outcomes in term of achievement, social skills, emotional aspects, more independence and creativity. The overall key impacts arising from professional learning communities operating within innovative contexts have improved the well-being of teachers and students. Finally, Owen concluded that teachers' innovative teaching approaches require changes to the traditional teacher role towards operating as co-facilitators, co-learners, and working in teacher teams, with considerable innovative professional learning communities.

Hsiao, Chang, Tu, and Chen (2011) found that teachers' self-efficacy is associated with their adoption of innovation. Moreover, their results showed that teachers' self-efficacy can predict their goals and attitudes toward innovation and change. They concluded that teachers with high efficacy are more likely to undertake more challenging activities that involving more creative practices. Cachia, Ferrari, Ala-Mutka, and Punie (2010) reported that many teachers and education experts felt that the curriculum in their countries is insufficient to encourage creativity and innovation mainly because they themselves are not clear how creativity should be defined and how it should be treated in learning and assessment. This situation become worse when curriculum are overloaded with content, which reduces the possibilities of creative and innovative learning approaches in practice.

Literature Reviews

Naz and Murad (2017) aimed to investigate the use of teachers' innovative strategies to respond to students' diversity at higher education level in public and private sector of Pakistan. Their findings showed that if teachers who used innovative teaching methods, can work effectively on students' diversity and will be able to enhance their performance. Moreover, their findings indicated that the innovation is more applied in private-sector universities than the public-sector universities. In addition, they found that the use of innovative strategies is more and highest in the discipline of humanities through mathematics subject. This implies that different disciplines of teachers perceived innovative learning differently. Teachers of humanities find the innovative strategies are more effective and easy to use particularly in mathematics teaching. Finally, they found that the class size decreases the effect of innovative strategies of teaching. In other word, the larger class size, the less impact of innovative teaching.

Barrett and Breyer (2014) found that school leaders must instill passion in teachers and provide effective leadership to motivate teachers to be innovative to engage and energize their students while they are teaching. Their study was focused on how modeling instructional strategies by school leaders to influence teachers' implementation of innovative strategies that promote greater student engagement and learning. They suggested that effective leadership and modeling can sustain teachers' passion for teaching and also provide them with the motivation to engage students in their lessons.

Cheng and Wu (2016) studied the learning experiences of teachers' professional development in Chinese secondary schools under a socio-cultural framework. Their findings revealed that social and individual affordances are very important to teachers' professional development and is prerequisite to the sustainable growth of teacher learning community. Cheng and Wu's findings were supported by past researchers such as Bae, Hayes, Seitz, O'Connor, and DiStefano (2016) and Morgan, Farkas, Hillemeier, and Maczuga (2016) who pointed out the importance of teachers working in professional learning communities to implement reformed teaching as they share knowledge and resources, critically examine and reflect on one another's practices, and use innovative evidence from student work and classroom observation to inform instruction.

Educational policy can be an important factor to cultivate a creative and integrative teacher. Therefore, South Korea has adopted a new national curriculum to promote flexibility and creativity of teachers on how the students address the new challenges of the 21st century (Cho & Huh, 2017). Moreover, there are six key competencies as the core skills for Korean students in the new educational policy, namely self-management, knowledge and information processing, creative thinking, aesthetic sensibility, communication skills, and civic competency. These competencies are found to be in line with Thailand Second Decade of Educational Reform (2009-2018) that highly emphasize the importance on the quality of life-long learning (Ariratana, Sirisooksilp, & Tang, 2016).

Research Objectives

Based on the literature reviews above, researchers would like to study the multi-level structural equation model of teachers' learning innovation at schools which affiliated to the Office of Basic Education Commission in Thailand. The following are the specific objectives of this study:

- i. To explore the primary factors, secondary factors, and indicators of teachers' learning innovation in a multi-level structural equation model.
- ii. To examine the congruence of the structural model with empirical data.

Methodology

This research consisted of two phases employing a mixed mode design to collect the qualitative data and quantitative data respectively. The in-depth interviews were the technique used to elicit a vivid picture of the five experts or practitioners' perspective on the factors of teachers' learning innovation. Researchers used qualitative research paradigm that was in-depth interview for the first phase in order to identify teachers' learning innovation factors of structural equation model. Purposive sampling technique was employed for the first phase for the identification and selection of information-rich cases for the most effective use of limited resources (Patton, 2002). This involves identifying and selecting individuals that are especially knowledgeable or experienced with this phenomenon of interest (Cresswell & Plano Clark, 2011). In addition to knowledge and experience, Bernard (2002) noted the importance of availability and willingness to participate, and the ability to communicate experiences and opinions in an articulate, expressive, and reflective manner.

After researchers conducted the in-depth interviews with the five experts or qualified practitioners to examine how they viewed the teachers' learning innovation factors and further to examine if they agreed with the results. Mixed mode design is referred as a combination of different modes of collecting data for a single research. Researchers intend to use the qualitative data analysis from the in-depth interviews to assist in explaining and interpreting the findings of the quantitative data at second phase (Creswell, 2014). At the second phase, a survey quantitative method was employed to 1,621 principals and teachers from 416 schools that affiliated to the Office of Basic Education Commission utilizing a multi-stage random sampling technique. Sample size was determined based on Meyers, Gamst, and Guarino's (2006) rules of thumb because Meyers et al. proposed that suitable sample sizes depend upon the numbers of items available for factor analysis. The unit of analysis of this study was school using questionnaire as an instrument.

The interviews were audio recorded and partially transcribed, then coded using a theme analysis approach (Miles & Huberman, 1994). During coding, key themes related to research questions were identified, such as concrete primary factors, secondary factors, and indicators were identified. After the first round of coding, similar themes were grouped into larger categories (Strauss & Corbin, 1990). Exact quotes representing each frequently occurring theme were then fully transcribed based on the audio recordings. To ensure participant anonymity, participants' quotes are identified only by symbol R. The identified factors further discussed and made the final decisions by the five experts or qualified practitioners. The research instrument for the first phase was a semi-structure interview protocol and data was analyzed using content analysis.

At the second phase, researchers utilized the quantitative data and analyzed using SEM in order to fit the model with empirical data. SEM is suitable to use because the theoretical constructs of this research are represented by the latent factor. The relationships between the theoretical constructs are represented by regression or path coefficients between the factors. The SEM implies a structure for the covariance between the observed variables. Confirmatory Factor Analysis (CFA) is used to validate the structural equation model. Secondly, SEM directs around fitting the structural model by measuring the significance of the relationship between latent variables, which is accomplished through path analysis (Kaplan, 2000). CFA was used as a desirable validation stage preliminary to the main use of SEM to identify the causal relations among latent variables (Schumacker & Lomax, 2004).

Findings

Findings of this study are presented according to the research questions as indicated above.

Qualitative findings of primary factors, secondary factors, and indicators of teachers' learning innovation

Qualitative findings from the five experts or qualified practitioners revealed that there are seven primary factors, 26 secondary factors, and 73 indicators included as the multi-level structural equation model. The macro or organizational level variables consisted of educational policy, school leadership, and professional learning community while the micro or individual level variables comprised of self-efficacy, creativity, and achievement motive.

Quantitative findings of identified factors of teachers' learning innovation in a structural relationship model

CFA was used to validate to identify the causal relationships among the latent variables from the first phase. An overview of teachers' learning innovation as indicated in Table 1 below shows that each factor had its loading

value ranging from 0.670 to 0.820 and 0.646 to 0.883 within and between levels respectively at significant level as 0.01. As a result, all the identified factors of teachers' learning innovation are found to be important construct either at micro (individual) or macro (organizational) levels. Table 1 shows the factor loading value and reliability of each factor in the multi-level structural equation model.

Table 1: Factor loading value and reliability of each factor in the multi-level structural equation model

Notes: * $p < .05$, ** $p < .01$

Table 2 shows that the total effect of factors between level to teachers' learning innovation was 81.4 percent ($R^2 = .814$) and within level was 75.9 percent ($R^2 = .759$). School leadership had direct and indirectly effect but educational policy and professional learning community only have direct effect to teachers' learning innovation at between level. Additionally, school leadership found to have direct effect to professional learning community and educational policy. On the other hand, creativity had direct effect but self-efficacy had indirect effect to teachers' learning innovation. Only achievement motive had both direct and indirect effects at within level. In addition, self-efficacy and achievement motive has direct effect to creativity of teachers.

Findings from the corrections between the factors of teachers' learning innovation could be evaluated in the standard component score (β) which indicated significantly high and positive correlations at 0.01. On top of that, it was found that the structural equation model has a goodness fit with evident data, with $\chi^2 = 1,023.203$, $df = 568$, $p = .052$, $\chi^2/df = 1.801$, CFI = .953, TLI = .932, RMSEA = .010, SRMRw = .181, and SRMRb = 0.242. Finding shows that the structural relationship model of teachers' learning innovation were consistent with empirical data as shown in Figure 1 and Table 2 below.

Discussion

This research was designed to provide insight into the multi-level structural equation model of teachers' learning innovation in schools that affiliated to the Office of Basic Education Commission in Thailand. Owing to it is not always possible to deal with single level data structures, researchers have to check the model adequacy as an important step in the model building process through interviewing the five experts or qualified practitioners. The initial phase is made to estimate the factors to fit the multilevel structural equation model (Brown, Mason, Spokane, Cruza-Guet, Lopez, & Szapocznik, 2009).

Teachers' learning innovation in the model includes the values for causal factor analysis, as shown by the high values of factor loading for the six factors. This case has turned into an outcome based on two fundamentals driver, namely macro (organizational) and micro (individual) drivers. The developed multi-level structural equation model fit to the exact empirical data. All empirical data were consistent with the criteria of Diamantopoulos and Siguaw (2000). In addition, these factors were likewise as per the exploration of Songmunuaykun (2005), who utilized the Mplus software for preparing data with all factors as per the predetermined criteria. Be that as it may, they were not in accord with Tochat, Chanpeng, and Meemak (2012), whose χ^2 indicated factual essentialness that was not as per the determined criteria.

All factors in the multi-level structural equation model at both individual and organizational levels could clarify the effect of teachers' learning innovation and portray the teacher individual characteristics such as creativity, self-efficacy, and achievement motive coupling with organizational characteristics such as school leadership, educational policy, and professional learning community. The multi-level structural equation model could be used to describe the relationship of the cause and effect of teachers' learning innovation for both individual and school organizations. This model could be utilized as a means of detailing the underlying model and the results of its creation.

The multi-level structural equation model fit construct validity when considering the causal effect value affecting the teachers' learning innovation, as mentioned above. Alternatively, the empirical data fit with the theoretical model. At the macro level, school leadership affected teachers' learning innovation through educational policy, in which the direct, indirect, and total effects were at .378, .263, and .641, respectively and statistically significant at .01. School leadership also affected teachers' learning innovation through professional learning community, in which the size of direct, indirect, and total effects were at .378, .160, and .538, respectively and statistically significant at .01. This implies that school leadership is the process by which school administrators try to exert their power to gain rapport, respect, and hence have an influence to merge the differences exist among teachers' thought, interest, and want. Thus, the inferiors of teachers will make them willing and enthusiastic to do what the school administrators want. In this respect, teachers' learning innovation is one of the school's target used by the school administrators to motivate, encourage, and support their teachers for creation of innovations in their teaching. The finding is in accordance with Barrett and Breyer's (2014) and Somprach's (2014) findings who found that one of the key roles of school administrators is to encourage the creation of classroom innovations.

Educational policy affected teachers' learning innovation with the direct effect of .354 and statistically significant at .01. This implies that educational policy is a tool the school administrators use to set the direction and goal

towards success. It is the guidelines for establishing implementation means from the current situation towards the future including the school plans that will lead to emergence of teachers' learning innovations. This finding is in line with Lertnaisat and Charoensuk (2014) who highlighted that educational policy is the factor that supports potential and innovation development. Professional learning community affected teachers learning innovation with the direct effect as .207 and statistically significant at .05. This finding is supported by previous researchers such as Giles and Hargreaves (2006) and also Somprach et al. (2017) who emphasized that professional learning community model can lead to a greater strength of the school's general activities and innovations.

At the micro level, creativity found to be successfully affected teachers' learning innovation with the direct effect as .697 and statistically significant at .01. This implies that creativity is the ability that enables teachers to see the relationships among various conditions thus stimulates their ideas and thinking. This finding is correlated to Naz and Murad's (2017) finding. Naz and Murad believed that individual creativity is an important element behind innovation creation for the success of an organization. In addition, Chimthongdee and Kaemkate (2015) who conducted a causal model of teachers' ability to create innovation also found that creativity had direct effect on teachers' ability to create innovation.

Self-efficacy was found to affect teachers' learning innovation with the direct, indirect, and total effects as .041, .585, and .626, respectively and statistically significant at .01. This implies that self-efficacy enables teachers to work efficiently and influences their creation of learning innovations. Hsiao et al. (2011) stated that self-efficacy is related to creative problem-solving and innovation construction, and self-efficacy has positive correlation with innovation creating. Achievement motive was found to be significant factor in the model with direct, indirect, and total effects as .125, .019, and .144, respectively and at statistically significant at .05. This implies that achievement motive is teachers' expression that demonstrates their wants and needs for success and has positive impact on the creation of learning innovation. This finding is agreed by past researchers such as Chimthongdee and Kaemkate (2015) and Zennouche (2014).

Finally, researchers would like to suggest to Thailand Ministry of Education to conduct training which incorporating all the factors that affecting teachers' learning innovation. Our findings suggest that human resource department at the Ministry of Education needs to recruit school administrators who have potential for promote professional learning communities as a means to facilitate teacher individual characteristics such as creativity, self-efficacy, and achievement motive in order to encourage teachers' learning innovation. Other practical consideration may involve the facilitation of an increasing understanding and appreciation of research evidence to help basic education school administrators specifically and teachers generally on how to develop innovative abilities and promote maximum innovative performance in their teaching.

Abstract

Piyano eğitimine başlangıç aşaması kadar piyano eğitimine hazırlık dönemi de özellikle erken yaş çocukluk döneminde önemli bir yere sahiptir. Erken yaş dönemi için yazılmış ve piyano eğitimine hazırlık olması hedeflenen metotlar piyano eğitimcileri tarafından yazılmaya başlanmıştır. Bu dönemde kullanılan metotlar küçük yaş çocukların gelişimi için önemli olduğu kadar ortalama yaş piyano eğitimine hazır bulunuşluk sağlamak açısından da önemlidir. Buradan yola çıkılarak bu çalışmada erken yaş piyano eğitimini hedefleyen My First Piano Adventure (Faber ve Faber, 2006) - Lesson Book A, Lesson Book B, Lesson Book C metotlarının görsel, teknik, teorik ve müzikal yönden incelenmesi amaçlanmaktadır. Araştırmacı tarafından görsel, teknik, teorik ve müzikal yönden metotları incelemek amacıyla hazırlanan inceleme kriterleri uzman görüşüne sunulmuştur ve yeniden düzenlenerek son halini almıştır. İlgili metotlardan elde edilen verilerin analizinde içerik analizinden yararlanılmaktadır. Belirlenen kriterler doğrultusunda incelenen metotlar araştırmacı tarafından yapılan tablo yardımı ile sunulacaktır. Araştırmanın veri analizleri devam ettiği için bulgu ve sonuçlar ilerideki süreçte paylaşılacaktır.

The primer level of piano training is very important for all ages of children. These methods are generally written to answer the demand for a course of study designed especially for students who are 3 and up years. It seems important for the further stages of piano education how these methods prepare to students. Based on this idea, selected primary level piano methods will be analyzed. For this study, My First Piano Adventure (Faber and Faber, 2006) – Lesson Book A, Lesson Book B, Lesson Book C were chosen. This study is a qualitative research. The purpose of this research is analyze the methods in terms of visual, technical, theoretical and musical expression. The data collected will be analyzed by descriptive analysis. The data will be presented in tables. Since the research is on the analysis process, the findings and results will be presented later on.

Naslardan Hüküm İstinbatı Sürecinde Arap Dilinin Tesiri

Fatih ORHAN

Çukurova Üniversite İlahiyat Fakültesi Balcalı Sarıçam/Adana, Türkiye
forhan@cu.edu.tr

Özet

Kendisine has bazı hususiyetleri olan Arap dilinin İslam Hukukunun oluşması sürecinde önemli bir araç olarak kullanılmış olması fıkıhın teşekkülünde oldukça etkili olmuştur. Elbette dilin içtihadı faaliyetine ve dolayısıyla fıkıh ilmine olan etkisi, Arap dilinin taşıdığı olduğu lengüistik özelliklerine göre farklı şekillerde tezahür etmiştir. Biz de dilin İslam Hukukundaki etkilerinin nasıl ve ne ölçüde olduğunu gösterebilmek için Arap dilinin hususiyetlerinden birisi olan “Hurûfu’l-Meânî” konusunu merkeze almayı tercih ettik. Bu çerçeveden hareketle şer’î hükümlerin oluşumunda müçtehitlerin dili nasıl kullandıklarını, naslarla olan irtibatlarını nasıl kurduklarını ve müçtehidin naslardan hüküm istinbat ederken dil unsurundan ne kadar etkilendiğini ortaya koymayı amaçlıyoruz.

Anahtar Kelimeler: *İslam Hukuku, Hurûfu’l-Meânî, Fıkıh, Dil.*

Giriş

Fıkıh ilmi tafsîlî ve şer’î delillerden istinbat edilen hükümler manzumesi olan bir ilimdir. Bu sebeple fıkıhın en başat delillerini, Şâri’nin hitabı olan hükmü ifade ediyor oluşu nedeniyle kitap ve sünnet oluşturmaz. Müçtehid tüm gayretini nasları anlama ve yorumlama gayretine sarf eder. Nasların anlaşılmasında birçok farklı etmen etkili olduğu kadar tabiatıyla nasların lafızlardan müteşekkil olması lafzın anlaşılması adına dil hususiyetlerini de önemli kılmaktadır. Biz bu çalışmada Şâri’nin hitabına anlamada dolayısıyla fıkhi görüşlerin oluşumunda Arap dilinin tesirini yansıması adına Hurûfu’l-Meânî konusu üzerinde duracağız.

Arapçada kelime isim, fiil ve harf diye üç kısma ayrılır. Arapçadaki harfleri de kendi içerisinde iki kategoride toplamak mümkündür. Bunlardan birincisi, Türkçedeki harf kullanımıyla aynı olan kısımdır. Yani kendi başına bir anlamı olmayan ve “ و ” kelimesindeki “Vav” harfi gibi kelimenin oluşmasında yapı taşı olarak kullanılan harflerdir. Usûlcüler bu kategorideki harflere “Hurûfu’l-Mebânî” ismini vermişlerdir. İkincisi ise, Türkçede tam karşılığı edat olan harflerdir. Yani “ قام زيد و عمرو ” cümlesindeki “Vav” harfi gibi başkasına muhtaç olmakla birlikte kendi başlarına bir anlam taşıyan harflerdir. İşte bu ikinci kategorideki harflere usûlcüler “Hurûfu’l-Meânî” demişlerdir. İsimler ve fiiller yerine göre hakikat ve mecaz anlamlarda kullanıldığı gibi harfler de bazen hakikat bazen de mecaz anlamlarda kullanılabilir. İşte harflerin fıkhi ihtilaflar konu oluşu bu kullanım farklılığından kaynaklanmaktadır.

Edat anlamındaki harflerin sayısı ve bunlara ilişkin malumatın oldukça fazla olması buna karşılık tebliğin sunumu için ayrılan sürenin kısıtlı olması nedeniyle biz iki harf üzerinden konuyu izah etmeye çalışacağız.

A. “İzâ” Harfi Ve Kullanıldığı Anlamlar

1. Zaman ve Şart

“İza” harfi zaman ve şart anlamlarında kullanılmaktadır. Fakat dilciler ve fakihler, “İza” harfinin bu anlamları aynı anda mı yoksa duruma göre sadece birini mi ifade ettiği hususunda ihtilaf etmişlerdir. Ebû Hanîfe’ye göre, “İzâ” harfi hem zaman anlamını hem de şart anlamını müştereken taşır. Fakat cümle içerisinde, bu anlamlardan sadece birisi için kullanılır. Diğer, o esnada kullanılmaz. Yani şart anlamında kullanıldığında vakit anlamı düşer ve “İn” harfinin içerdiği manada sadece şart harfi olur. Ayrıca şart için kullanıldığında ceza cümlesi de gerektirir. Vakit için kullanıldığında ise, şart anlamı düşer ve sadece vakit anlamı için kullanılır. Kûfeli dilciler de Ebû Hanîfe’nin görüşünü desteklemektedirler. Onlara göre de “İza” harfi bu iki anlamı müştereken taşımaktadır (Teftâzânî, t.z.; Zerkeşî, 1993; İbn Melek, t.z.).

İmameyne ve Şâfi’ye göre ise, “İzâ” harfi zaman için kullanılır ve istikbal manasındaki fiil cümlesinin başına gelir. Bazen de tıpkı “Meta” harfi gibi mecazen şart için de kullanılır ki o durumda da “zaman anlamı” kaybolmaz. (İmameyne göre, “Meta” harfi zaman içindir ve bu anlam şart için kullanıldığında bile devam eder.) Şîrâzî’ye göre de, “İzâ” harfinin hükmü “Meta” harfinin hükmüyle aynıdır. Mesela, “ متى القتال ” “Savaş ne zaman?” sorusuna, “ شئت اذا ” demekle, “ متى شئت ” demek arasında bir fark yoktur. “Meta” harfi ile aralarındaki tek fark şudur; “Meta” harfi “İzâ” harfine göre, zamana delaleti bakımından daha geneldir. Bu konuda Basralı dilciler İmameyn ile aynı fikirdedirler (Teftâzânî, t.z.; Zerkeşî, 1993; İbn Melek, t.z.).

2. Hal

“İzâ” harfi yemin cümlelerinden sonra “ و الليل اذا يغشى ” “İnsanların sükûna vardığı geceye and olsun ki” (Duha 93/2) ayetinde olduğu gibi hal olarak gelir. Örnek; “İzâ” harfi hal olduğunda şart manasından soyutlanır. Çünkü şart anlamı taşıdığına, şartın cevabı ya cümlede zikredilmesi gerekir, ya da “İzâ” harfi önceki cümlelerin şart olduğuna delalet

eder. Bu ayette ise, ne cevap zikredilmiştir ne de “İzâ” harfi önceki cümlelerin şart olduğuna delalet etmektedir. Bu yüzden şart anlamı verilmemektedir (Zerkeşî, 1993).

B. İzâ Harfinden Kaynaklanan Fıkhi İhtilaflar

1. Her Namaz İçin Abdest Almanın Hükümü

“إذا قمتم إلى الصلوة فاغسلوا وجوهكم و ايديكم إلى المرافق و امسحوا برؤسكم ارجلكم إلى الكعبين” “*Namaza kalktığınız zaman, yüzlerinizi, dirseklere kadar ellerinizi ve –başlarınızı sıvayıp- topuklarınıza kadar ayaklarınızı yıkayın.*” (Maide 5/6) ayeti bizlere namaz kılacak kişi için abdest almanın farz olduğunu ifade etmektedir. Bu konuda bir ihtilaf mevcut değildir. Fakat her namaza kalkmanın abdest almayı gerektirip gerektirmediği hususunda fakihler ihtilaf etmiştir.

Cumhura göre, abdest bozulmadığı sürece her namaz için ayrı abdest almak gerekmez (Râzî, 1995). Bu konuda selef ve halef arasında bir ihtilaf yoktur. Ayrıca lafızda namaz için kalktıktan sonra abdestin tekrar edilmesini gerektiren bir durum da mevcut değildir. Ayette yer alan “İzâ” harfi ise, her namaz için kalkmadan sonra abdest almanın vacip olması hususunda umum anlam ifade etmez. Çünkü “İzâ” harfi Arap dilinde tekrar gerektirmez. Mesela, bir kimse hanımına “انت طالق اذا دخلت الدار” “*Eve girdiğinde boşsun*” dese, hanımı da bir kere eve girse boş olur. Daha sonra hanımı, ikinci kez eve girse, karısı ikinci kez boşanmış sayılmaz. İşte bu örnek, “İzâ” harfinin umum ifade etmediğine delalet eder. Başka bir örnek ise, bir kimse, “اذا دخل زيد الدار فاعطه درهما” “*Zeyd eve girdiğinde ona dirhem ver*” dese ve Zeyd bir kere eve girse, dirhemi almaya hak kazanır. Başka bir defa daha girse bir şey hak edemez. Bu örnekten anlaşılıyor ki, ayetteki “İzâ” harfi her namaz için kalkmanın tekrarıyla abdestin tekrar etmesinin zorunlu olduğuna delalet etmez (Cessâs, 1335; Râzî, 1995). Cumhurun dayandığı ikinci delil ise, Hz. Peygamber’in Mekke’nin fethinde bir abdestle günün bütün namazlarını kılmasıyla ilgili olan âhad haberdur (Râzî, 1995).

Zahiri kaynaklardan Muhallâ’ya baktığımızda bununla ilgili bir görüşe rastlayamadık fakat Râzî’nin Zahirilere yaptığı isnatta Zahirilere göre, her namaz için ayrı abdest almak vaciptir (Râzî, 1995). Râzî’ye göre, Zahirî mezhebinin bu görüşü benimseme nedeni ise, “إذا قمتم إلى الصلاة” ayetinin zahiridir. Yani onlara göre ayetin takdiri, her namaz kılmaya niyetlendiğiniz de abdest alın şeklindedir. Ayetten anlaşılan budur. Çünkü ayetteki “İza” harfi umum ifade eder (Râzî, 1995). Zahiriler “izâ” harfinin tekrar ifade etmediğine dair Cumhurun verdikleri örneklerin tekrar ifade etmemesini olayı kuşatan karinelere bağlamış ve haklı bir örnek olmadığına kanaat getirmişlerdir. Oysa Kuran’da varit olan mükellefiyetlerin temeli, tekrara dayanmaktadır. Bu sebeple söz konusu ayetteki “İzâ” harfi de umum ifade etmelidir (Cessâs, 1335; Râzî, 1995).

2. Talak Cümlesindeki “İzâ” Harfinin Hükümü

Bir kişinin hanımına, “اذا لم اطلقك فأنت طالق” “*Seni ne zaman boşamazsam o zaman boşsun*” demesi halinde talağın ne zaman gerçekleşeceği hususunda Hanefî âlimler ihtilaf etmişlerdir. Ebû Hanefî’ye göre talak ancak birinin ölümüyle gerçekleşir, aksi takdirde gerçekleşmez. Çünkü Ebû Hanife’ye göre, “İza” harfi yukarıda belirttiğimiz gibi hem şart hem de zaman ifade etmek için kullanılır. “İza” harfi şart için kullanıldığında zaman anlamı düşer ve sadece şart ifade eder. Tıpkı “İn” harfi gibi görev görür ve cümle “إن لم اطلقك” şeklinde denmiş gibi olur. Dolayısıyla kişi hanımını boşanmayı, onu boşamama şartına bağlamış olur. Onu boşamama ihtimali de ikisinden birisi ölünceye kadar devam eder. Bu yüzden birisi ölünce boşama gerçekleşir.

Ebû Yusuf ve Muhammed’e göre ise talak, konuşmadan hemen sonra gerçekleşir. Onlara göre “İza” harfi belirttiğimiz gibi mecazen şart anlamında kullanılır. Bu durumda ise zaman anlamı kaybolmaz. Bu yüzden “Meta” harfi gibi görev görür. Bu durumda cümle tıpkı “متى لم اطلقك” denmiş gibi olur. Dolayısıyla adam boşamayı, talaktan hâli olan bir vakte izafe etmiştir. Bu vakit ise, kişi sustuğunda mevcut olur ve boşama gerçekleşir. İmam-ı Şafii’ye göre de, “İza” harfi vakit için olduğundan bu örnekte boşama konuşmadan hemen sonra gerçekleşir. Çünkü konuşmadan sonraki zamanda boşama gerçekleşmemiştir.

Buradaki ihtilaf şart veya zamana niyet edilmeksizin kullanılan “İza” harfi hakkındadır. Eğer kişi, “İzâ” harfinin bu iki anlamından birine niyet ederse, o zaman ittifakla niyet edilen mana geçerli olur. Eğer “İza” harfi ile şart kastettim derse, ikisinden birisi ölmedikçe talak gerçekleşmez. Tıpkı “İn” harfi ile söylenmiş gibi olur. Eğer zaman kastettim derse, boşama hemen gerçekleşir. Bu durumda da “Meta” harfiyle söylenmiş gibi olur (Serahsî, 1984; Zerkeşî, 1993; İbn Melek, tz.).

A. “Min” Harfinin Kullanıldığı Anlamlar

1. İbtidâu’l-Gâye

“Min” harfi “İlâ” harfinin aksine “İbtidau’l-Gaye” için kullanılır (Gazzâlî, 1980; İbn Rüşd, tz.; Bâcî, 1989; İsnevî, 1985; Zerkeşî, 1993; Neseî, 1986; Hilâlî, 1986; Zelemî, 1983). Ali b. Süleyman, Müberred, İbn Sıraç, Süheyli ve bir grup dilciye göre “Min” harfi sadece “İbtidau’l-Gaye” için kullanılır. Aşağıda anlatacağımız anlamlarda kullanılmaz. Bu görüşü Uşfur da teyit etmektedir. “Gaye”nin başlangıcı olarak kullanıldığı cümledeki yerine “الذى” konulduğunda cümlelerin doğru olmasından anlaşılır (Sübkî, 1981). Min harfinin “İbtidau’l-Gaye” anlamında kullanılması “من المَسْجِدِ”

”مِنْ أَوَّلِ يَوْمٍ أَحَقُّ أَنْ تَقُومَ فِيهِ فِيهِ“ (İsra 17/1) ayetinde olduğu gibi ya mekân yönünden olur, ya da “مِنْ أَوَّلِ يَوْمٍ أَحَقُّ أَنْ تَقُومَ فِيهِ فِيهِ” (Tevbe 9/108) ayetinde olduğu gibi zaman yönünden olur (Sübkî, 1981; Zelemî, 1983).

Dilciler, “Min” harfinin mekânlar için “İbtidau'l-Gaye” olduğu hususunda ittifak etmişlerdir. Fakat zamanlar için “İbtidau'l-Gaye” olup olmadığında ihtilaf etmişlerdir. Sibeveyh'e ve Basralı Cumhura göre, zamanlar için “Gaye”nin başlangıcı olamaz. Onlara göre sadece mekânlar için

“Gaye”nin başlangıcı olur. Zamanlar için “Gaye”nin başlangıcını bildiren “منذ” harfidir. Ahfeş, Müberrek, İbn Mâlik ve Kûfeli dilcilere göre ise, “لِلَّهِ الْأَمْرُ مِنْ قَبْلُ وَمِنْ بَعْدُ” (Rum30/4) ayetinde olduğu gibi “Min” harfi zaman bakımından da “Gaye”nin başlangıcı olabilir. Bunu destekleyen daha birçok örnek mevcuttur (Zerkeşî, 1993).

Bazen ise “Min” harfî, “من محمد رسول الله إلى هرقل عظيم الروم” “Hz. Muhammed'den büyük Rum kralı Heraklius'a” örneğinde olduğu gibi mekân ya da zamanın dışındaki bir durumda da “İbtidau'l-Gaye” için kullanılabilir (Sübkî, 1981).

2. Tebyin

“Min” harfî, öncesinde bir âmm lafzın gelmesi, sonrasında ise bir has lafzın gelmesi koşuluyla (Zerkeşî, 1993) bazen “Tebyin” görevi görür (İbn Rüşd, tz.; Sübkî, 1981; Zerkeşî, 1993). Mesela, “فَاجْتَنِبُوا الرِّجْسَ مِنَ الْأَوْثَانِ” (Hacc 22/30) ayetinde pis durumdan kaçınmak emredilmektedir. “الرِّجْسَ” Âmm bir lafızdır, “Min” harfî de kendinden sonra gelen hass lafızla pis olan durumu açıklamaktadır.

Ebû Hayyan, mensubu bulunduğu mezhebin çoğunluğunun, “Min” harfine “Tebyin” görevini yüklediklerini ve bu anlamı yüklemeyi de uygun bulmadıklarını ifade etmiştir. Onlara göre, “Min” harfî hiçbir zaman bu anlama gelmez. Yukarıda ifade edilen ayetteki “Min” harfî onlara göre, “Gaye”nin hem başlangıcı hem de sonudur. Çünkü putlar demirden, bakırdan, altından ya da başka bir şeyden şekillendirilerek yapılan şeylerdir. Dolayısıyla bunlar zatı itibarıyla pis olan şeyler değildir. Ayette emredilen kaçınma, putlardan değil, onlara ibadet etmekten kaçınmadır. Dolayısıyla ayetteki “Gaye”, putlara tapınmaktan kaçınmaktır. Bu kaçınma eylemi ise, putlara tapmanın hem başını hem de sonunu kapsadığı için “Min” harfî bu ayette, “putlara tapınmaktan kaçınmak” “Gaye”sinin hem başlangıcı hem de sonudur (Sübkî, 1981).

Serahsî ise, bu örneği “Min” harfinin “Sıla” olarak kullanılmasına örnek vermiştir. Gerekece olarak da vaz olunduğu hakikat anlamına ya da mecaz anlamlara hamletmenin imkânsız oluşunu ve cümlede bu harfe ihtiyaç duyulmasını delil göstermiştir (Serahsî, 1984).

3. Teb'iz

“Min” harfinin kullanıldığı anlamlardan birisi de “اخذت من الدراهم” “Dirhemlerden bazılarını aldım” örneğinde olduğu gibi “Teb'iz” anlamıdır (Cessâs, 1985; Cüveynî, 1999; Gazzâlî, 1980; Bâcî, 1989; İsnevî, 1984; İsnevî, 1985; Zerkeşî, 1993; İbn Melek, tz.). Bu örnekten, dirhemlerin tamamının değil bir kısmının alındığı anlaşılır. “Min” harfinin “Teb'iz” anlamında kullanılıp kullanılmadığı, onun yerine “بعض” kelimesinin getirilmesi ve bu kelimenin cümle anlamını bozmamasıyla anlaşılır. Mesela bir kadına, “طَلَقِي نَفْسَكَ مِنْ ثَلَاثٍ مَا شِئْتَ” “Üç talaktan dilediğin kadar boşa” dense, kadının bir yada iki boşamayı kullanma hakkı vardır. Üç talakın hepsini de kullanamaz (İsnevî, 1984).

İbn Duhan, bazı âlimlerden “Min” harfinin “Teb'iz” anlamında kullanılması için “بِأَمْرِ اللَّهِ يَنْقُصُ مِنْهُمُ مَنَّا وَمِنْهُمْ مَنَّا فَصَصْنَا عَلَيْكَ وَمِنْهُمْ مَنَّا نَقْصُصُ عَلَيْكَ” “Onlardan bazılarını Mü'min'dir ve çoğunluğu fasıktır” (Âli İmran 3/110) ayetine dayanırlar.

Âlimlerin çoğunluğuna göre böyle bir şartın olmaması gerekir. “مِنْهُمْ مَنْ قَصَصْنَا عَلَيْكَ وَمِنْهُمْ مَنْ نَقْصُصُ عَلَيْكَ” “Ve onlardan bazılarını sana anlattık ve bazılarını anlatmadık” (Mü'min 40/78) ayetinde olduğu gibi bunu ispatlayan birçok ayet de mevcuttur (Zerkeşî, 1993).

4. Umum-u Te'kid

“Min” harfî bazen “Umum-u Te'kid” anlamında kullanılır. Bu durumda “Cins-i Nefyetme” anlamı içerir (Gazzâlî, 1980). Konuyla alakalı olarak Sibeveyh, şu örneği ifade etmektedir; “ما جاءني رجل” “Bana bir adam gelmedi” cümlesi umumdur fakat “ما جاءني رجل بل رجلان” “Bana bir adam gelmedi fakat iki adam geldi” şeklinde teville ihtimali vardır. Fakat “ما جاءني من رجل” “Bana hiçbir adam gelmedi” cümlesi ise umumdur ve “Min” harfinden dolayı tevil ihtimali olmaksızın adam cinsinin hepsini nefyetmektedir (Cüveynî; İsnevî, 1985).

Âlimler, yukarıda anlatılan dört anlamdan hangisinin, “Min” harfinin asıl anlamını olduğu hususunda ihtilaf etmişlerdir. Birinci görüşe göre, “Min” harfinin asıl anlamı “İbtidau'l-Gaye” dir. Diğer anlamlar ise bu anlama tabidir. Cürcanî'nin de belirttiği gibi, “Min” harfî “İbtidau'l-Gaye” anlamını hiçbir zaman yitirmez. “Teb'iz” ve “Cins-i Beyan” anlamları karineler yardımıyla bilinir. Bu yorum, lafızlara müşterek anlam vermekten ya da kelimeyi mecaz yapmaktan daha geçerlidir. Bu görüşün destekçisi olan İbn Arabî, bu anlatılanların doğru olduğunu belirttikten sonra şunları demektedir; Her “Teb'iz” anlamı, “Gaye”nin başlangıcıdır. Fakat her “Gaye”nin başlangıcı “Teb'iz” değildir.

İkinci görüşe göre, “Min” harfinin gerçek anlamı “*Tebyin*”dir. Yani “*Cins-i Beyan*” dır. Diğer anlamlar bu anlama tabidir. Bu anlam, bütün anlamlar arasında müşterek anlam olarak kullanılır. Mesela, “سرت من الدار الى السوق” “*Evden çarşıya kadar yürüdüm*” cümlesinde, yürümenin başlangıcı beyan edilmiştir. Diğer örnekler de bunun gibidir.

Üçüncü görüşe göre, “Min” harfinin asıl anlamı “*Teb'iz*”dir. Bu görüş dilcilerin fazla rağbet etmemesinden dolayı tercih edilen bir görüş olmamıştır.

Dördüncü görüşe göre, “Min” harfinin asıl anlamı “*Teb'iz*” ya da “*Gaye*” anlamlarıdır. Yani bu iki anlamdan birisi için kullanılır. Hangisi için kullanılırsa, kullanıldığı o anlam, “Min” harfinin asıl anlamı olur (Zerkeşi, 1993).

5. Kullanıldığı Diğer Anlamlar

“Min” harfi bazen “كَلَّمَا أَرَادُوا أَنْ يَخْرُجُوا مِنْهَا مِنْ غَمٍّ...” *Üzüntüden dolayı oradan her çıkmak istediklerinde*” (Hacc 22/22) ayetinde olduğu gibi “*Ta' lil*” anlamında kullanılır (İsnevî, 1984; İsnevî, 1985; İbn Melek, tz.; Hilâlî, 1986). “يَنْظُرُونَ” “*Göz uçlarıyla baktıklarını...*” (Şura 42/45) ayetinde olduğu gibi, bazı yerlerde “*Be*” harfi anlamında kullanılır (İsnevî, 1985; Hilâlî, 1986; Zelemî, 1983). Bu ayetin takdiri “بَطْرَفٍ خَفِيٍّ” şeklindedir. “Min” harfi bazı kullanımlarda ise, “أَرُونِي مَاذَا خَلَقُوا مِنَ الْأَرْضِ” “*Bana yerden ne yarattıklarını gösterin*” (Fâtır 35/40) ayetinde olduğu gibi, “*Fi*” harfine uygun bir anlamda kullanılır (Hilâlî, 1986; Zelemî, 1983). Zerkeşi’ye göre, “Min” harfi bu ayette “*Fi*” harfi anlamında değil “*Beyanü'l-Cins*” olarak görev yapmaktadır (Zerkeşi, 1993).

“Min” harfinin, “*Alâ*” harfiyle aynı anlamda kullanıldığı durumlar da mevcuttur (Cüveynî; Gazzâlî, 1980; İsnevî, 1985; Hilâlî, 1986; Zelemî, 1983). Mesela; “وَنَصْرَنَاهُ مِنَ الْقَوْمِ” “*O topluma yardım ettik*” (Enbiya 21/77) ayeti, “عَلَى الْقَوْمِ” şeklinde takdir edilir. Suyuti’ye göre, “لَنْ تُغْنِي عَنْهُمْ أَمْوَالُهُمْ” “*Malları onları korumayacaktır*” (Âli İmran 3/10) ayetinde olduğu gibi “Min” harfinin “*İnde*” harfinin kullanıldığı anlama yakın bir anlamda kullanılması da mümkündür (Hilâlî, 1986; Zelemî, 1983).

İsnevî, “Min” harfinin yukarıdaki anlamların dışında “*Fasl*”, “*Bedel*”, “*An*” ve “*Bima*” harfleri anlamında da kullanılabileceğini ifade etmiştir. Fazla kullanılmaması nedeniyle olsa gerek, bu anlamları sadece isim olarak zikretmekle yetinmiştir. Örnek verme ihtiyacı hissetmemiştir (İsnevî, 1985).

B. Min Harfinden Kaynaklanan Fıkhi İhtilaf

Teyemmüm Edilecek Şeyler

“وَإِنْ كُنْتُمْ مَرَضَىٰ أَوْ عَلَىٰ سَفَرٍ... فَلَمْ تَجِدُوا مَاءً فَتَيَمَّمُوا صَعِيدًا طَيِّبًا فَامْسَحُوا بِوُجُوْهِكُمْ وَأَيْدِيكُمْ مِنْهُ” “*Eğer hasta veya yolculukta iseniz yahut biriniz tuvaletten gelmişse veya kadınlara yaklaşmışsanız ve su da bulamamışsanız, tertemiz toprağa teyemmüm edin ve yüzlerinize ve ellerinize sürün. Allah affeden ve bağışlayandır.*” (Maide 5/6) ayetiyle teyemmümün ne zaman yapılacağı bildirilmiştir. Fakat âlimler teyemmüm yapılacak şeyin neler olduğu hususunda ihtilaf etmişlerdir. Bu ihtilafın kaynağında ise konuyla ilgili hadislerin yanında teyemmüm ayetindeki “Min” harfinin anlamıyla ilgili yapılan yorumlar ve “*Said*” kelimesine verilen anlamlar yatmaktadır.

Ebû Hanife’ye göre kum, taş, kireç, kırmızı çamur gibi yeryüzü cinsinden olan her şeye teyemmüm yapılabilir. Ebû Yusuf ise sadece toprak ve kum üzerine teyemmüm yapılabileceğini söylemiştir (Cessâs, 1335; Şirbînî, tz.). Ebû Hanife’ye ait görüşün delilleri şunlardır:

1. Teyemmüm Ayetindeki “Min” harfi “*İbtidau'l-Gaye*” anlamındadır (Zerkeşi, 1993; Şirbînî, tz.). Yani ayetteki “Min” harfi teyemmümün yerin bir kısmıyla yapılmasını değil, teyemmüme elleri yere vurarak başlanmasını ifade etmektedir. “Min” harfinden “*Gaye*”nin, yerin bazı kısımlarına hamledilmesi gerekir” anlamı çıkarılamaz. Dolayısıyla kişi sert bir kayayı veya taşı meshetse yeterlidir. Çünkü yeryüzünden başlanmıştır. Şayet bir hayvanı veya elbiseyi meshetseydi yeterli olmazdı. Çünkü bunlar yeryüzünün kapsamına girmez (Zerkeşi, 1993).
2. Cassas ise, bu anlamla ilgili olarak şöyle bir yorum yapmaktadır; ayette vurgulanmak istenen, mesh için niyetin vacip olduğunu tekit etme anlamıdır. Çünkü “Min” harfi bazen “خرجت من الكوفة” “*Kufe’den çıktım*” sözünde olduğu gibi “*İbtidau'l-Gaye*” anlamında kullanılır. Buna göre ayetin tevili “işe yerden başlayıp ellere ve fasılaj olmaksızın yüze ulaşın” şeklindedir. Fakat mesh ile yerden başlama arasında fasıla bulunmaktadır. Dolayısıyla niyet hükmü kesintiye uğramaktadır. Bu yüzden niyetin yenilenmesi ihtiyacı hâsıl olur. Mesela, “توضأ” “من النهر” “*Nehirden abdest al*” cümlesi, abdesti almaya nehirden başlanılmasını ve kesinti olmaksızın abdest organlarına ulaşılmasını ifade eder. Ayrıca ayetteki “منه” kısmının Şafiilerin dediği gibi “بعض منه” şeklinde de anlaşılması mümkündür. Bu durumda ise, kendisine mesh edilebilecek şeyler için kullanılır. Bunlar ise yeryüzü cinsinden olan her şeyi kapsar. Çünkü Allah cc. toprağı suya bedel kılmıştır. Yani teyemmüm için, suyun yerine toprağı temizleyici kılmıştır. Yeryüzündeki şeyleri suyun yerine bedel kılmamız bizim yetkimiz dâhilinde değildir. Bunlar ancak tevkifi olarak bilinebilir. Hz. Peygamber “yeryüzü bana mescit ve temiz kılındı.” ve de “toprağı bizim için temizdir.” buyurmuştur. Bu da bize yeryüzünün tamamının bedel kılındığını gösterir. Altın, gümüş ve inci gibi şeyler teyemmüme uygun sayılmaz. Çünkü bunlar yeryüzünün tab’ından değildir. Bunlar yere emaneten bırakılmış madenlerdir. Hz. Peygambere madenler hakkında sorulduğunda şöyle demiştir; “Altın ve gümüş

Allah'ın yeryüzünü yarattığı günde yarattığı şeylerdir. İnci ise Sedeften çıkarılır. O da su hayvanıdır. Kül ise odundur." Dolayısıyla bunlar yeryüzünün tab'ından ve özünden değildir. Aynı şekilde pamuk ve kar gibi şeyler de teyemmüme uygun olmaz. Çünkü bunlar da yeryüzünün cinsinden değildir (Cessâs, 1335).

3. Ayette geçen "Sâid" Ebû Bekir'e göre yeryüzünün kabuğunu teşkil eden bütün parçaların adıdır. Bu ise özel olarak toprağın tahsis edilmesini gerektirmez. Aksine yeryüzünün bütün cüzlerini kapsar ve hepsine teyemmüme müsait kılar. İbn Arabî'den gelen rivayet de bu yöndedir. Ayetin zahirine göre yerin bütün cüzlerine mesh etmek caizdir (Cessâs, 1335).

4. Ebû Hüreyre'den yapılan rivayet; "Çöl halkından bir grup kimse Hz. Muhammed'in yanına gelerek şöyle dediler: "Bizler üç dört ay kumluklar arasında kalıyoruz. Aramızda cünüp, loğusa ve hayızlılar oluyor. Bizler su bulamıyoruz." Peygamber efendimiz şöyle buyurdu: "عليكم بأرضكم" "Size bulunduğunuz yer yeter" Hadiste tavsiye edilen yer kumlu bir bölgedir. Kum ise yeryüzünün bir cüzüdür. Bu da sadece toprağa hasredilmenin yanlış olduğunu aksine, yeryüzünün cinsinden olan her şeyin teyemmüme uygun olduğunu gösterir (Cessâs, 1335; İbn Kudame, tz.; Zühaylî, 199).

İmam-ı Şafii'ye göre teyemmüm sadece ele bulaşacak şekilde tozu bulunan (Cessâs, 1335; İbn Kudame, tz.; Şirbînî, tz.) ve yanmamış toprak üzerine yapılabilir. Bundan başka bir şey üzerine teyemmüm yapılamaz. Şafiiler buna ilaveten tozu bulunan kuma da teyemmüm yapılabileceğini ifade etmişlerdir (Cessâs, 1335; İbn Kudame, tz.; Şirbînî, tz.; Zühaylî, 1994). Ebû Yusuf da bu görüşü savunmaktadır (Cessâs, 1335; İbn Kudame, tz.). Şâfiilerin delilleri ise şunlardır:

1. Ayetin "فَامْسَحُوا بِمِئْتَةٍ" kısmındaki "Min" harfi "Teb'iz" anlamındadır. Zemahşerî, ayetteki "Min" harfinin "Teb'iz" anlamında olduğu göstermek için "مَسَحَ بِرَأْسِهِ مِنَ الدُّهْنِ" "Biraz yağ ile başını meshetti" sözünü delil gösterir. Arap olan bir kimse bu sözden ancak "Teb'iz" anlamı anlar. Ayetteki "Min" harfinin "Teb'iz" anlamında olduğu anlaşıldığına göre, teyemmümün yeryüzünün bir parçasıyla yapılması gerekir. Yeryüzünün teyemmüme uygun olan kısmı ise, tozu bulunan şeylerdir. Çünkü teyemmüm bir taharettir. O halde bu taharete temizleyici olan unsurun, başın meshinde olduğu gibi taharet yerine ulaştırılması gerekir. Bu da ancak tozu olan şeyle mümkün olur.¹

2. Hz. Peygamberden yapılan rivayet; "Yeryüzü bana mescit, toprağı da temiz kılındı." Bu hadise göre teyemmüm yapılacak şey topraktır. Çünkü toprağın temiz kılındığı bu hadisle anlaşılmaktadır (Şirbînî, tz.).

Sonuç

Harflerin fûru fıkıh konularındaki ihtilaflara olan etkisi kendilerine yüklenen anlamların çeşitli oluşu ve naslardaki kullanımlarında bu anlamlar üzerinde bir ittifakın bulunmamasıdır. Harflerin taşıdığı anlama ilişkin iki temel ihtilaf noktası vardır. Bunlardan ilki harflerin taşıdığı bu anlamlardan hangisinin hakikat hangisinin mecaz anlam olduğunu tespit hususudur. Bir grup usûlcüye göre harfin hakikat olan anlamı diğer gruba göre mecaz anlamı olabilmektedir. Mesela, bir grup usûlcü "Min" harfinin hakikat anlamının "İbtidau'l-Gaye" olduğunu iddia ederken başka bir grup hakikat anlamının "Teybin" olduğunu iddia etmiştir. Bu şekildeki ihtilafa bağlı olarak "Min" harfinin hakikat anlamı için dört farklı anlam dile getirilmiştir. Hakikat anlamının tespiti hususunda usûlcülerin yaşadıkları bir başka ihtilaf nedeni ise, harfin hakikat anlamında ittifak etmekle birlikte bu anlamın mahiyetini tespitteki görüş ayrılıklarıdır. Mesela usûlcüler "Vav" harfinin hakikat anlamının "cem" olduğunda ittifak etmekle birlikte, her bir ekol "cem" anlamının mahiyetini farklı biçimlerde algılamışlardır. Hanefiler, "cem" anlamını mutlak olarak (tertib ve maiyyet gerektirmeksizin) algılamak, Şâfiiler "tertibe uygun cem" şeklinde yorumlamışlardır. Malikiler ise "maiyyete göre cem" anlamında olduğunu iddia etmişlerdir. Bir

Harflerin hakikat veya mecaz anlamlarına bağlı olarak yaşanan ihtilafın ikinci şekli hakikat anlam üzerinde ittifak edilmesine karşın cümle içerisinde kullanıldığında hakikat anlamında mı yoksa mecaz anlamında mı kullanıldığının tespit edilmesinde tezahür eder. Bu harflere ilişkin ihtilaf nedenleri arasında en sık rastlanılan durumdur. Mesela, "Ev" harfinden kaynaklanan fıkhi ihtilafı anlatırken belirttiğimiz gibi, bir ekol ayetteki "Ev" harfinin mecaz anlamda kullanıldığını söylerken, diğer ekol hakikat anlamında kullanıldığını söylemiştir. Tabi ki bu durum farklı görüş ve hükümlerin verilmesine neden olmuştur.

Harflerin neden oldukları bir başka ihtilaf çeşidi, taşıdıkları anlamdan ziyade cümlede kullanılmasının uygun olup olmamasından kaynaklanan ihtilafıdır. Bazı harfler, taşıdığı anlamın kullanıldığı cümlelerin konusuna uygun olmaması sebebiyle bazı usûlcülerce o tip cümlelerde kullanılması hoş karşılanmamıştır. Mesela, "tahyir" anlamı taşıyan bir harfin mehir yahut vekâlet cümlesinde kullanılması uygun bulunmamıştır. Çünkü tahyir, mehrin veya vekâlet verilen kişinin bilinmemesine neden olur. Bu da mehrin tespitine yahut vekilin tayinine engel olur. Fakat bazı fakihler bu harflerin bazı şartlar altında bu cümlelerde kullanılmasına vermiştir. Dolayısıyla bu tip cümlelerde izin vermeyen fakihler cümleden farklı bir hüküm çıkarırken, izin veren fakihler daha farklı hükümler çıkarmışlardır.

¹ Zerkeşî, 1993; Şirbînî, tz.; Zühaylî, 1994;

Bazı harflerin taşıdıkları anlamların mahiyetini tespitteki ihtilaflar da fıkhi ihtilaflara neden olmaktadır. Mesela, gaye anlamı taşıyan “İla”, “Hatta” ve “Min” harflerinin bu gaye anlamını hangi sınırlar içerisinde taşıdığı hususunda usulcüler ve fakihler ihtilaf etmişlerdir. Bir grup gayenin muğayyaya dâhil olduğunu söylemiş, bir grup da dâhil olmadığını söylemiştir. Fırû meselelerinde de ona göre hüküm çıkarmışlardır.

Bütün bu durumlarda usulcüler kendi savundukları anlamın geçerliliğini kanıtlamak için yine harflerin Arap dilindeki kullanımlarını gerekçe göstermişlerdir. Bu da bize usulcülerin ve fakihlerin, harflerin anlamlarını tespit ederken Arap dilindeki anlamlarına sadık kaldıklarını yeni bir Şer’i anlam yükleme çaba ve gayreti içerisinde olmadıklarını göstermektedir. Bunun yanında ayetlerdeki kullanımları da kendilerine dayanak almışlardır. Fıkhi meselelerde de ise, görüşlerini kanıtlamak için Hz. Peygamber’in uygulamalarını delil göstererek fikirlerini desteklemeye çalışmışlardır.

Abstract

We describe a path which came into being after it was noted that Italian primary school children (aged 6-11 years) have difficulty in understanding the necessity for using different numerical sets depending on the problem they are dealing with. We decided to use a mostly visual support which would be simple, engaging and able to evolve over time. Thus, the poster “Nat and his friends” was born, where the characters appear, for the first time, in the moment in which a problem requires it in the five years of Italian primary school. Besides “Nat” (the set of natural numbers), “Ra” (the set of rational numbers), “Rel” (the set of relative numbers), other characters were necessary, that is, “Al”, “Geo”, “Misu”, “Alea”. “Geo” and “Alea” represent two areas, respectively that of geometry and that of mathematics of uncertainty; “Al” is the “depository” of procedures, while “Misu” steps in when there are problems of measurement. Lastly, there is “Logic the Traveller”. This character, given that she is a “traveller”, is not on the poster; she is mostly used when dealing with problems of classification.

1. Introduction

At Italian primary school level (5 years: from first to fifth year, with children aged 6-11 years), mathematics aims to provide tools to investigate and explain many of the phenomena of the world which surround us, favouring a rational approach to the problems that reality sets (see MIUR, 2018; see also Canetta, Manara & Marchi, 1986, and Angeli, D’Amore, Di Nunzio & Fascinelli, 2011). This happens for the natural number, in both cardinal and ordinal aspects: The first aspect stems from the spontaneous and “natural” operation of counting and translates, first via concepts and then symbols, the relationship of equipotency between finite sets of concrete objects; the second aspect may be reached through elementary operations of comparison between sets of different cardinality or using “natural” intuition in linear ordering or alignment. The first moment of construction of the natural number is therefore that of carrying out a comparison between finite sets which leads to the construction of an abstract concept.

The aim of primary school is to widen the learners’ fields of interest and, as a consequence, there are more and more things to learn about the world outside: Thus, from handling concrete sets which have a finite number of elements, requiring the use of natural numbers, we arrive at the presentation of problems with solutions in other numerical sets. Therefore, the foundations are created for the necessity for new cognitive and expressive “worlds”, which will be the subject for study after primary school.

Obviously, difficulty in comprehension and, correspondingly, didactic difficulty increase. It should be said that the difficulties encountered by the learners, in their experiences with numbers, are the same as those of human beings through the centuries, in the historical evolution of the concept of the number, as the various numerical systems were introduced in response to differing questions regarding means to control certain situations. If the subject of natural numbers seems to be managed (quite) well, difficulties arise with handling and understanding the significance of rational numbers (and their representations) and continue to increase when, at secondary school level, real numbers, not to mention complex numbers, are dealt with.

2. The Research Project

The project illustrated here was born in the context of our research group (“Nucleo di Ricerca in Didattica della matematica”, Department of Mathematics and Earth Science, University of Trieste, Italy), comprising a mixed group of teachers from nursery, primary, middle and high school level (who teach children and young people between 3 and 19 years old), led by university teachers involved in many activities to promote and improve mathematics teaching at the various school levels. In the course of the periodical group meetings, difficulties, gaps, and misconceptions are highlighted and together we try to find strategies and approaches of “prevention” and “solution”. Our activity is also “outward-looking” whereby we organize events to promote mathematics for children and young people and initial training or refresher courses for teachers; among these activities we should

remember “La matematica dei ragazzi”, which has been held every two years since 1996 this year being the twelfth time (see Leder, Scheriani & Zuccheri, 2002, and Zuccheri & Zudini, 2014).

The idea for the present research came from the observation over a period of years by one of the authors of this paper (a primary school teacher since 1996 in Trieste) that primary school children experience great difficulty in recognizing that an entity belongs to a certain numerical set (in particular, distinguishing between natural and rational numbers) or other mathematical fields (for example, geometry, measurement, ...).

In the specific context of our project, we believe that the research experience presented here has importance both for preventing the formation of misconceptions and for limiting the difficulties encountered by the children. According to the project, the experience would be expected to start right in the first year of primary school and to run throughout the whole period of primary school, ending in the fifth year.

With regard to the present state of the research, begun in the first year of the Primary School “G. Foschiatti” of Trieste (15 pupils) in 2015, we are now at the end of the third year (June 2018).

3. “Nat And His Friends”

3.1 The Birth Of The Poster

Previous experience of one of the authors of this paper (over a period of more than 15 years) demonstrates that the use, right from the first year of primary school, of a poster which shows a picture of nine children, the “Children of Mother Grammar”, allows all pupils, even the ones who have some difficulty, to recognize the nine parts of speech of Italian grammar.

The drawing (see Figure 1) is based on the fact that every child-character, who represents a part of speech (noun, article, verb, adjective, adverb, preposition, pronoun, exclamation, and conjunction), has his/her own colour and “is doing” something related to his/her grammatical function. For example, “Article” (drawn slightly smaller than “Noun”) holds hands with “Noun”, who, in turn, holds hands with “Adjective”: In Italian grammar, these agree, or “get on with each other”.

Figure 1. The poster “Mother Grammar” (Figure and photo by D. Leder)

If the methodology works for learning Italian grammar, why not then use the same sort of visual aid (poster) for mathematics and try creating a poster with characters relating to it?

3.2 Characters Of The Poster

In the first year of the Primary School “G. Foschiatti of Trieste, the following characters were born in 2015 (listed in order of appearance), each of whom are depicted as a boy/girl, identified with a colour and the characteristics accessible to the pupils at the present state of the research (that is, at the end of the third year, June 2018):

1. “Nat” (coloured blue), representing natural numbers; in line with his prerogative, he does not write anything and counts pointing (cardinal and ordinal aspects of the natural number) (see Figure 2).

Figure 2. “Nat” (Figure and photo by D. Leder)

2. “Al” (coloured white, perhaps because he is acknowledged as “cutting across” various fields), representing the writing of numbers; Nat’s precise and fussy brother, in line with his prerogative, he puts everything in order and records by writing down (he compares, orders, writes, and enables the consultation of the algorithms of operations) (see Figure 3). The children, for the time being, have understood more the operative aspect rather than that of the writing.

Figure 3. “Al” (Figure and photo by D. Leder)

3. “Ra” (coloured red), representing rational numbers; in line with her prerogative, she shares out a bar of chocolate (see Figure 4). “Ra” has appeared a little earlier than usual in the school syllabus but in this way the learners arrive, with greater familiarity, at decimal numbers and fractions.

Figure 4. “Ra” (Figure and photo by D. Leder)

4. “Misu” (coloured green), representing measurement. In line with his prerogative, he compares two equal baskets which contain quantities of fruit to decide if they are equal or, if not, which one is lesser or greater

than the other (see Figure 5); when he has decided, he might need “Nat” and then, if “Nat” cannot help him, he calls “Ra”.

Figure 5. “Misu” (Figure and photo by D. Leder)

5. “Geo” (coloured brown), representing geometry; in line with her prerogative, she traces paths and identifies the shapes of the fruit and leaves and dreams about an ice cream and a witch’s hat (in order to have solid figures, such as cones and cylinders, represented also in other contexts) (see Figure 6). “Nat” and “Ra” are very friendly and close with her, even if she often has to ask for help also from “Al” (for example, for calculating a perimeter).

Figure 6. “Geo” (Figure and photo by D. Leder)

All these characters are drawn in a wood, on the poster of “Nat and his friends” (see Figure 7)

Figure 7. The poster “Nat and his friends” (Figure and photo by D. Leder)

Starting from the first year, whenever there is a need or a necessity, these child-characters are “called”. For example, if I have a cake and I want to divide it up into 6 equal parts, who shall I call? Surely “Nat”! And also “Al” and maybe even “Ra”.

Further characters have been added:

6. In the third year (this year), Mrs. “Logic” has appeared; she is a traveller. She is the twin sister of the “Logic” used in Italian and is multi-coloured, like a rainbow (as she is recognized as “cutting across” various fields and therefore not part of the poster) (see Figure 8). The choice of her name is due to her interventions with “and”, “or”, “not”, while remaining clear that she is to be distinguished from her twin sister who intervenes in Italian.

Figure 8. “Logic the Traveller” (Figure and photo by D. Leder)

7. At the end of the third year, also “Alea” (“die” in Latin) has appeared as an objective necessity for the problematic situation to be solved, representing probability and statistics; in fact, she plays with dice. “Alea” does not have a colour, but her clothes have the same markings as a die (see Figure 9). She is not yet on the poster, but she will appear at the beginning of the fourth year (September 2018).

Figure 9. “Alea” (Figure and photo by D. Leder)

8. Instead, “Rel” has shyly appeared in the third year, representing relative numbers; he wears red and black clothes and has in his hand a notebook and a pen to record losses and gains (see Figure 10). He has been informally introduced because the children became curious about “numbers with minus in front”, mentioned by adults during some very cold days, therefore linked to measuring temperature in degrees Celsius. This provided an opportunity to explain that the numbers on the thermometer and the numbers represented by “Rel” are two different things. “Rel” has shyly appeared because it was not yet the right moment to introduce him mathematically and it has not yet been explained why he is dressed as he is, nor why he is holding that notebook...that will be for future discussion... for the moment we have only ruled out that he is a Milan football fan (whose players and fans are identified by the colours red and black). We can disclose that the colours red and black relate to the method of accounting (red is used for outgoings and black for incomings).

Figure 10. “Rel” (Figure and photo by D. Leder)

It should be made clear that the names of the characters make way for the “real” names which the learners will encounter (formally) later on, at middle and high school (for example, “Nat” leads to “natural numbers”, “Ra” to “rational numbers”).

4. First Assessment Of The Poster As A Teaching Support

It is still early to make an objective assessment inasmuch as we are at the end of the third year, only a little over halfway through the experimental period. The children have had time to get to know the characters better and better as they themselves consolidated their knowledge in the field of mathematics.

The fact that they could discuss together in class has allowed for possible doubts to come out and then new stimuli to introduce or develop the subject (see Pontecorvo, Ajello & Zuccheromaglio, 1999). To give an example, we have discussed who we should “call” when meeting an apparent fraction: “Ra” or “Nat”? Or again, for zero...is “Nat” alright or “Ra”, or both? Or, furthermore, can “Al” stand alone?

Certainly, the children have been very taken by these characters, so much so that at the end of the third year (June 2018), of their own volition, they performed a short show for the parents, playing the parts of the characters and showing how they “function”, i.e. setting problematic situations which the parents had to solve “calling” the correct (appropriate) characters. It was a useful experience where everybody, even the pupils who have difficulty, took active part.

4.1 Recognition Of The Character Required By The Situation

At the end of the third year, first specific tests were held to ascertain if the children were able to link correctly the character/s with the context provided, showing awareness of the problematic situation that they were dealing with. There were two types of test: In the first type (“PROVA 1”) the children were presented with numbers, operations, and measurements which they had to circle, using the colours of the characters and thus showing that they recognized by colour the character/s which needed to be “called” (graphic test); in the second type of test (“PROVA 2”), which dealt with problematic situations (in the form of a text), the pupils were required to choose the characters (more than one) to “call” putting an “X” on the characters which were written beside.

If, during the curricular lessons, there was always someone in the group who verbally found the right correspondence, in the written tests, in the situations where the pupils just have to call a single character (it does not matter whether it is “Nat” or “Ra”, given that “Al” cannot stand alone, and “Misu” and “Geo” rarely appear alone), 98% of the children identify “Nat”, while 87% identify “Ra”.

Clearly, a problematic situation which requires the consideration of more than one aspect at the same time (i.e. calling more than one character) can be more difficult for 8-year-old children (as is seen from the results obtained regarding, for example, “Nat” and “Ra”: only 84% of the children recognize “Nat” and 53% “Ra”). The ability to take into account simultaneously various aspects is, after all, a skill which should be fostered in relation to the pupils’ cognitive development; we can work towards this to help acquire a greater awareness of the difficulties of the problematic situations and to develop a positive attitude towards it (without fear).

4.2 Future Developments In Research

We have seen how the characters and their personalities have evolved since the beginning of the research, acquiring over time features and prerogatives as the children, bit by bit, encountered increasingly complex problematic situations.

This will presumably also happen as the research continues (starting up again in September 2018, with the beginning of the fourth year, and continuing until the end of the fifth year), where we might reasonably suppose that the characters will be better defined and discussed in their peculiarities in relation to new learning situations. It will be useful to evaluate step by step, through suitably-prepared tests, the competencies which the pupils develop in recognizing that an entity belongs to a certain numerical set or to other mathematical fields. After modifying their text accordingly, the same tests may be given, with the cooperation of teachers who are part of our research group, also to learners in schools of higher level, in order to check the correspondence with our results.

Abstract

This research was aimed to investigate the current and desirable supervision conditions and thus develop a draft model that enhancing critical thinking of science teachers in expansion schools. This is followed by evaluating the developed draft model. A total of 384 science teachers were selected as respondents using a multi-stage random sampling technique. Researchers employed a quantitative survey design. This research utilized two types of instruments namely questionnaire and evaluation form. Descriptive statistics such as percentage, mean score, and standard deviation and also the formula Modified Priority Needs Index were used to analyze the data. Findings of this research revealed that the current supervision condition to enhance critical thinking is at moderate level whereas the desirable supervision condition is at highest level. Subsequently, finding of the development model needs for supervision demonstrated in descending order as follows: (i) principles of supervision; (ii) work evaluation and improvement, and (iii) knowledge distribution and learning methods. Finally, the developed draft model ATOMS to enhance critical thinking was comprised of five factors namely assessment of context, teaching and learning methods, objectives, mentoring and coaching, and summative evaluation and improvement.

Keywords: *Coaching; critical thinking; primary school; supervision model*

Introduction

In recent years, there has been a shift in many countries including Thailand in their national educational curriculum policy statements from an emphasis on knowledge to an emphasis on higher order thinking skills (Fung, Townsend, & Parr, 2004). In Thailand, critical thinking is considered to be an important educational goal at all levels of schooling. However, there appears to be little agreement about the importance of increasing critical thinking ability, there appears to be little agreement in what is it, how critical thinking should be done, and how to facilitate students. In general, the major difficulty in educating for critical thinking is lack of a synthesized understanding about what is meant by the term, and what an effective critical thinking supervision model to enhance critical thinking for science teachers in particular becomes urgency to investigate.

The foundation for critical thinking (n.d.) clarified the importance of evaluating instruction for critical thinking is to improve students' abilities to think their way through content, using disciplined skill in reasoning. Critical thinking issues such as how to define critical thinking, how to teach critical thinking, and whether critical thinking should be taught or learned through social interaction plague science teachers who think about enhancing the critical thinking skills of their students (Choy & Cheah, 2009). Tang (2018) defined critical thinking as a skill that is taught at school and university but its main purpose is to better equip the students to understand the world, to make more sense of the vast amount of information that is available to us and to avoid, being manipulated. This is further supported by Prasertcharoensuk, Tang, and Tuksino (2017) as life skill.

Critical thinking, in a broad sense, is the thinking that alerts and guides science teachers to examine the quality of their thinking as well as that of others so that science teachers become more certain of whether they are making a good choice of what to believe and do. In a strict sense, when science teachers engage in critical thinking they want to put themselves in a position to distinguish good thinking from faulty thinking, and also in a position to identify what has made it good or faulty. Through critical thinking science teachers want to enhance our thinking ability so that they can respond to problems and opportunities in ways that facilitate individual and collective well being and growth.

Thailand 4.0 model is currently promoted by current Thai government to lead the country to its innovation economy stage, with the aim to elevate potentially to be a wealthy and secure developed nation of the first world in the context of a 4th phase economic revolution (Chantarasiri, 2017). Sungchai (2009) emphasized that school administrators have to emphasize the learning processes that enabling the development of critical thinking, problem-based learning, and knowledge implementation skills for real life situation in accordance with the

National Education Act of Thailand. This is further highlighted by Nillapun (2011) stated that the concept of 21st century skills including two main skills namely critical thinking and problem-solving as well as creative and innovative skills. These skills are vital for students to be independent learning with a high level of critical thinking when comprehending information.

Research Objectives

The main aim of this research was to investigate the supervision model seeking to enhance critical thinking for science teachers in expansion schools, Thailand. To achieve this aim the following specific objectives were formulated to guide the research:

- i. To investigate the current and desirable conditions of supervision to enhance critical thinking for science teachers in expansion schools.
- ii. To evaluate the developed draft supervision model to enhance critical thinking for science teachers in expansion schools.

Method

Researchers employed survey questionnaire as a method to collect quantitative method. A total of 7,063 Grade 7 science teachers who are working in expansion schools under the administration of Primary Educational Service Areas, Office of the Basic Education Commission were the population of this research. The required sample size was 364 samples according to Krejcie and Morgan's Table at 95 percent confident level using multi-stage random sampling technique.

The research instruments used were a questionnaire and an evaluation form. Both instruments were administered in Thai language to ensure that the respondents were clear about the statements. The questionnaire was constructed to enquire on current and desirable conditions of supervision that enhancing critical thinking. Furthermore, respondents' responses towards the needs of the supervision model to enhance critical thinking, a five-point Likert scale was utilized, ranged from most, much, moderate, less, and least.

Other than the survey questions in the form of questionnaire, an evaluation form was used to measure the suitability of the developed draft supervision model by the nine experts. This methods benefits this study in terms of obtaining data more efficiently as time, energy and costs could be minimized (Sekaran 2006), provides an excellent means of measuring attitudes and orientations in a large population which can, therefore, be generalized to a larger population (Babbie 2002).

According to Chueachot, Srisa-ard and Srihamongkol's (2013) interpretation of opinions toward current and desirable conditions of supervision that seeking to enhance critical thinking were analyzed using the formula of Modified Priority Needs Index (PNI_{Modified}). As a result, researchers determined its level as shown in Table 1. Data was analyzed using descriptive statistics include percentage, mean score, and standard deviation. This is followed by the analysis and priorities the needs for supervision seeking to enhance critical thinking for science teachers in expansion schools were prioritized (The Institute for Promotion of Teaching Science, Mathematics, and Technology, 2014).

Table 1: Interpretation of mean range

Mean range	Interpretation
1.00 – 1.50	The least level of comments
1.51 – 2.50	The less level of comments
2.51 – 3.50	The moderate level of comments
3.51 – 4.50	The much level of comments
4.51 – 5.00	The most level of comments

Results

The initial result is the descriptive results related to the characteristics or backgrounds of the respondents that derived from the Section 1 of the questionnaire. This is followed by results about the current and desirable conditions of supervision seeking to enhance critical thinking for science teachers in expansion schools. Next, the needs required conditions as well as the PNI reading on development supervision model are presented. Finally, an evaluation was conducted on the developed ATOMS model.

Descriptive results

Majority of the respondents (67.9%) are female, 40.19 percent of them aged between 36 to 45 years old. On top of that, all the respondents are holding the position as specialized teachers. A total of 50.09 percent of the respondents obtained a master's degree or higher academic qualification and 68.54 percent of them have

experience related to critical thinking training or have been trained in any program related to critical thinking (38.63%).

Results about current and desirable conditions of supervision

Results of respondents' opinions on current and desirable conditions of supervision seeking to enhance critical thinking for science teachers were categorized into two groups: (i) Current and desirable conditions of supervision seeking to enhance critical thinking; (ii) Current and desirable conditions of science teachers' abilities and behaviors related to critical thinking, as shown in Table 2.

Table 2: Current and desirable conditions of supervision

Supervision to enhance critical thinking	Current			Desirable			Needs index	Level of need index
	Mean	SD	Interpret	Mean	SD	Interpret		
Factors of supervision model to enhance critical thinking								
Principles of supervision	2.88	0.57	Moderate	4.60	0.42	Highest	0.60	1
Purpose	2.96	0.62	Moderate	4.71	0.42	Highest	0.54	4
Process:	2.64	0.58	Moderate	3.11	0.58	Moderate	0.17	8
Assessment of context								
Process: Teaching and learning methods	3.08	0.67	Moderate	4.68	0.38	Highest	0.52	5
Process: Objectives	2.99	0.69	Moderate	4.65	0.41	Highest	0.55	5
Process: Mentoring and coaching	3.09	0.56	Moderate	4.71	0.36	Highest	0.52	5
Process: Summative evaluation and improvement	3.01	0.63	Moderate	4.71	0.42	Highest	0.56	2
Use factors	3.21	0.58	Moderate	4.76	0.36	Highest	0.48	7
Total	3.00	0.58	Moderate	4.61	0.41	Highest		
Conditions of science teachers' abilities and behaviors related to critical thinking								
Learning management for enhancing critical thinking	3.24	0.50	Moderate	4.76	0.39	Highest	0.47	2
Behaviors related to critical thinking	3.36	0.56	Moderate	4.82	0.38	Highest	0.35	1
Total	3.33	0.58	Moderate	4.79	0.38	Highest		

Table 2 shows that the overall current condition of supervision to enhance critical thinking was at moderate level while the overall desirable condition of supervision to enhance critical thinking was at highest level for science teachers in expansion schools in Thailand. The needs for supervision to enhance critical thinking for science teachers in expansion schools, prioritized from highest to lowest in descending order are supervision principles, evaluation and improvement, and knowledge distribution and learning methods.

Results Of The Development Of A Supervision Model

Based on the findings above, researchers drafted a supervision model seeking to enhance critical thinking for science teachers. The drafted supervision model was then evaluated by nine experts. Findings from the nine experts' evaluation illustrated that the overall suitability of the supervision model is at the highest level ($\bar{x} = 4.78$; $SD = 0.18$). Specifically, findings indicated that the preparation, improvement while working, and post improvement evaluations were at the highest level as mean score 4.56, 4.81, and 4.68 respectively. However, the nine experts evaluated training as high level with a mean score as 4.50.

In addition, the nine experts suggested three additional concepts which could inform factors of supervision seeking to enhance critical thinking for science teachers in expansion schools, as follows:

- Current condition evaluation
- Relationship promotion
- Principles of supervision
 - Principles
 - Objectives
 - Supervision process
 - Assessment of context
 - Teaching and learning methods
 - Observations
 - Pre-observation conference
 - Event
 - Reflection
- Mentoring and coaching
- Summative evaluation and improvements

Development of ATOMS supervision model

The end product of this research was the development of ATOMS supervision model seeking to enhance critical thinking for science teachers. ATOMS is a concept of supervision that implies supervision should cover the content thoroughly and the roles of supervisor and science teacher should be clearly separated in every step of the teaching process. Researchers utilized a career developmental process or mentoring and coaching. The time shared between the supervisor and science teachers during supervision was significant as well as their friendly and close relationship played more than a coaching role itself. The principle of coaching was to give no direction, instructions or answers. If an answer was to be told in the context of two answers. A particular thinking process occurred in the supervisor's mind as a result of mentoring and coaching.

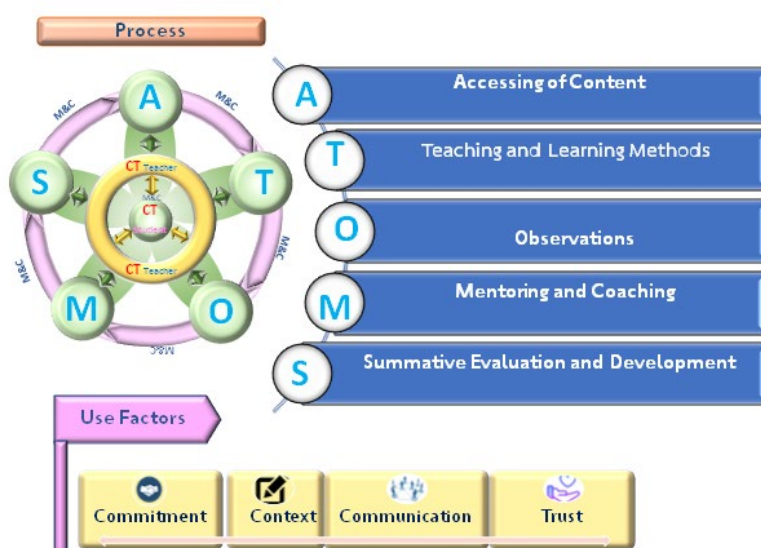

Figure 1: ATOMS Supervision Model

Discussion And Conclusion

The priority needs for supervision in descending order are principles of supervision, evaluation and improvement, and ability to manage the class to enhance critical thinking skills for science teachers. The findings show that overall and sub-items relating to the current condition of supervision seeking to enhance critical thinking are at moderate level but the desirable condition of supervision seeking to enhance critical thinking for science teachers are at highest level. On the other hand, the needs for learning management abilities in descending order are activities that allow students to identify the factors of a situation, to relate the problem to the information in order to choose the most relevant information, and to reflect on their opinions by recording them for examination and review in order to integrate them after the lesson. Moreover, findings of science teachers' critical thinking abilities showed that science teachers demonstrated open-mindedness and then logic in descending order. All the above findings are consistent with Buachoon, Yutakorn and Suwanruji's (2015) study, this implies that teachers' critical thinking development was found to be inconsistent and lacked of evaluation. Additionally, findings of this research also correlate with Iamsamang's study (2012) that investigated commercial college teachers' critical thinking

dispositions in Thailand.

Findings relating to ATOMS model consisted of five main factors, namely assessment of context (A), teaching and learning methods (T), observation (O), mentoring and coaching (M), and summative evaluation and improvement (S). This supervision model is correspond to Sungchai (2009) and Chuenklin (2010). Researchers would like to suggest to Educational Service Area Offices and expansion schools to implement a systematic development for science teachers that focusing on developing the principles of supervision, work evaluation and improvement, and knowledge distribution and learning methods in order to promote sustainable learning organizations. Finally, implication of this research is encouraging the policy level agencies to focus on supervision through managing a motivation system for supervisors, school administrators, and senior science teachers who can conduct effective supervision.

Research and development should be conducted using the factors obtained from this research. The obtained factors can be used as concrete criteria when carrying out supervision of science teaching. Researchers would like to recommend to future researchers to conduct a strategic supervision, especially to enhance critical thinking or advanced thinking level using monitoring and coaching. This will support the offensive development approach for supervisors throughout Thailand.

Abstract

The purpose of this research were to study the current condition, expected condition, and needed in talent management for basic education schools in Thailand. The sample is 380 school administrators in basic education schools. Data were collected by questionnaire with the 0.874 reliability. Data were analyzed by Priority Needs Index_{modified} (PNI_{modified})

The research found that : The current condition of talent management in basic education school in Thailand is overall level. Considering each component find all the overall level as more. The component with the most current condition is the retaining talent people, rewarding, the development of talented people, and identify the talented people respectively.

The expected condition of talent management in basic education school in Thailand is highest level. Considering each component find all the highest level as most. The component with the most expected condition is the retaining talent people, rewarding, the development of talented people, and identify the talented people respectively.

The needs assessment in the development of talent management in basic education school in Thailand found the component with the highest needs is identify the talented people (PNI_{modified} = 0.148), rewarding (PNI_{modified} = 0.103), the development of talented people (PNI_{modified} = 0.102), and the retaining talent people (PNI_{modified} = 0.084) respectively.

Keywords : *Needs Assessment, Talent, Management, Talent Management, Basic Education School*

Introduction

Good human resources refers to staff members who impose excellent skills and deliver high core competence at work. A proportion of good human resources at the working level accounts for only 3-5 percent of all workers in most institutes while the figure is reported at around 10 percent at the management level. Compared to other lay workers, good human resource people stand out from other lay workers based on the extent of the current and future impacts that the persons have upon their office affiliations. The amount of these qualified people in most offices lessens over time (Garuetin Kulpheng, 2009). Based on a school perspective, being a good staff member means being a teacher or other personnel who have a high degree of work commitment, creativity, work competence, and leadership who can help to direct the schools toward their goals. Therefore, managing talented school staff to get the best out of their capacity requires well-rounded professional skills (Dawruwan Thawinkarn, 2016). The management of talented staff members is done for the purpose of helping the staff to achieve the organization's goals. The capacity exhibited by good staff members exaggerates the survival of the institution and its competitive advantage. Schools represent another form of social units which are comprised of people of different hierarchies, such as administrators, teachers and other educational personnel. These groups of people are the gears that turn the wheels of educational mobilization. School principals should pay attention to carefully carving their staff members into talented associates because learning to manage the existing talented staff is not of secondary importance in school development.

Talent management means exercising measures to support the talented staff. Stated another way, talent management means attempting to obtain, develop, hire, and maintain good staff members within the organization. The principles, relating to talent management, have been consistently developed in different arenas, such as firms in the fields of education, business, and human resources. It is a kind of development that places emphasis on increasing the performance of individuals in alignment with the success of the organizations. When attempting to successfully manage talent in schools, management is often confronted with challenges to the creation of innovation and leadership for educational change. It is advisable for schools to continue their efforts in developing a talented staff and in encouraging networking with external institution. Moreover, it is important to tailor Training curricula that are aimed at developing leadership and talented staff. Accordingly, talent management should be set as a means for identifying, developing, hiring, maintaining and exploiting the talented staff members in the organization (Davies and Davies, 2011). Reviewing the literature related to talent management has shown that this kind of management directs the

schools toward excellence. Rudhambu (2014) investigated the talent management system in Botswana University and discovered that talent management contributes to workings of a progressive school. Agrawal (2010) conducted research about the talent management system of business schools. It was observed in this research that factors indicating of the success of talent management involved the following: school quality, motivation, work advancement, and wages. Annakis, Dass, and Isa (2014) explored factors contributing to the efficiency of talent management in government and private universities. They found that the talent staff's academic perceptions, the talent staff's development, and the culture for the talent staff's development are crucial for the success of talent development. A review of several research studies revealed a similar pattern of findings given the extent that talent management is mainly based on the following factors: 1) identifying talent staff, 2) the development of talent staff, and 3) the rewarding and maintaining of the talent staff {Arunwadee Nuntawattanukul, Pornrat Sadangharn, & Apinya Ing-art (2014), Supaporn Prasongtan (2015), Dawruwan Thawinkarn (2016), Collings and Mellahi (2009), Agrawal (2010), Tymon, Jr., Stumpf, & Doh (2010), Mandloi (2014), Cappelli & Kellahi (2014), Chauhan & Bhatt (2015)}.

Based on the importance of talent management as identified above, schools should be prompted to find effective measures especially for talent staff development. Talent management has not yet been introduced for Thai schools in the basic education system. Furthermore, there are relatively few research studies about talent management in the Thai schools. Consequently, the researcher has gravitated towards exploring the factors and indicators of talent management in the Thai primary schools. It is expected that the results derived from this research will be beneficial in helping the schools to successfully manage their talented people and direct their schools toward their set goals.

Research Objective

To study needs assessment of talent management for primary schools in Thailand.

Literature Review

In order to be able to precisely address the facets related to talent management in the Thai schools in the basic education system, the following documents were reviewed.

Definitions and philosophies of talented people

Talented people are defined based the two classifications below:

Group 1: Talented people can be classified from other members of a group based on their state of being a creator, a rule breaker, an initiator for change, and generator of knowledge. Davies & Davies (2011) explained that talent people are those who are blessed with many different professional skills. Talented people usually spend interesting, enthusiastic and energetic lives. They exhibit high capacity in problem-solving and finally manage to find solutions to the problems via effective use of resources. Similar ideas have been dictated by Apron Phoo Wittayapan, (2010) who stated that talented people are persons who possess talents, gifts, and characteristics that make them stand out from other candidates. Talented people are good at work and human management. It is important that talented people possess both good virtues and good knowledge since possessing only one of these two qualities does not mean anything for the institutional development.

Group 2: Talented people are associated with the person's traits, such as their capacity and potential. The Office of Civil Service Commission defines talented people as persons with high performances that are well-recognized by their affiliations. Talented people tend to possess high levels of work etiquettes and are prompted to become the crucial strength of organization. Wichai Wongyai (Mo.Po.Po.) regards talented people as those who stand out from the crowd with their creative thinking, high potential, effective performance, talents, and natural abilities. Talented people usually exhibit high degree of achievement and are well-respected by others. They are learning persons who have a passion for escalating their work advancement. Suganya Rasamitamachot (2011) says that talented people are those with high occupational skills that enable them to create superior performances. Talents that people from different fields of professions have can be various and can be based on the nature and culture of the individual organization.

This research study has attempted to investigate the management of talented people in Thai primary schools. The term, "talented people", is defined under the Thai school context as teachers or educational personnel who generate an outstandingly high level of performance as evidenced by their levels of education, academic positions, awards, and other empirical evidences. The impacts that talented teachers have on students, school and communities are used for locating talented teachers. More importantly, there are 11 desirable qualities for high school work potential that have been used to indicate talent teachers as follows: 1) demonstrating achievement-based performance, 2) giving good service, 3) having professional expertise, 4) endorsing justice and ethics, 5) demonstrating teamwork, 6) having bureaucratic commitment, 7) being creative, 8) having an holistic viewpoint, 9) being devoted to the public, 10)

participating in interpersonal interaction, and 11) being a learning person. The evaluation of these talents was based on the criteria imposed by the Office of Civil Service Commission.

Principles relating to talented people management in schools.

Josh Bersin (2007) imposed 8 steps for talented teachers evaluation as detailed below:

1. Workforce planning
2. Recruiting
3. Onboarding new employees
4. Performance management
5. Training performance support
6. Succession planning
7. Compensation and benefits
8. Critical skills gap analysis

Birchall, Holley & Reid (2008) applied human resource principles into the development of talent people and postulated 5 steps involved in the development of talented people.

1. Identification
2. Development Opportunities for Talent
3. Transparency
4. De-Selection
5. Creating Developmental Opportunities for The Talent Pool

Factors relating to the management of talented people in schools

After reviewing a hundred of documents with themes concerned with the components of managing talented people, the factors needed for managing talented people in school have been clarified in Table 1.

Table 1: Components, definitions, and sub-components for managing talented people in basic education schools

Components	Definitions	Sub-components
1. Identifying	The process of identifying talented people should be systematically carried out in order to be able to correctly specify the members of the talented group and to direct the appropriate development for them.	1) Planning personnel 2) Determining the talented people 3) Defining the key positions 4) Evaluating the advanced practitioners
2. Developing Talented People	Encouraging talented people with respect to their professional development in order to enhance their work potential.	1) Offering challenging assignments 2) Giving Empowerment 3) Enhancing the abilities of the talented people
3. Rewarding	Finding prevailing ways to increase the motivation of the talented people via forms of subsidization or other rewards.	1) Allocating incentives 2) Strengthening trust 3) Receiving recognition from the team 4) Strengthening the spirit
4. Retraining Talented People	Finding ways to retain talented people with the organization, increasing their patriotism & loyalty, and giving in for organizational development.	1) Strengthening the dialogue 2) Creating a supportive work environment 3) Developing role-models

Needs Assessment

Needs assessment is the process of value judgment or discretion to consider any one thing. By collecting and analyzing data. To obtain useful information in decision making and select the best choice. The research needs assessment is to determine the significance level of the needs assessment of talent management of primary school in Thailand. By evaluation framework principle 4 elements include: 1) Identifying 2) Developing Talented People 3) Rewarding 4) Retraining Talented People.

Research Methodology

- 1) Reviewing a hundred of documents with themes concerned with the components of managing talented people
- 2) Study current condition, desirable condition and needs assessment of talent management of primary schools in Thailand.

Instrument Of Research

Instrument is questionnaire needs assessment with 52 items that needs assessment of talent management of primary schools in Thailand. It is 5-level scale.

Sample Of Research

The sample is the primary school principals. Under the office of basic education study in 2560 of 380 people by multi-stage random sampling that determine the sampling size by using the concept of Hair et al. (1998) proposed criteria.

Data Analysis

Data were analyzed by mean, standard deviation, and Priority needs index : PNI modified

Results

The study found the main elements are 1) Identifying 2) Rewarding 3) Developing Talented People 4) Retaining talented people respectively. As shown in table 2.

Table 2: The needs of talent management for primary schools.

Components	Current condition			Desirable condition			PNI _{modified}	rank
	\bar{X}	S.D.	Translate	\bar{X}	S.D.	Translate		
Identifying	4.00	0.65	More	4.59	0.56	Most	0.148	1
Developing Talented People	4.25	0.60	More	4.69	0.51	Most	0.102	3
Rewarding	4.28	0.59	More	4.72	0.47	Most	0.103	2
Retraining Talented People	4.37	0.57	More	4.74	0.46	Most	0.084	4
Total	4.23	0.55	More	4.69	0.48	Most		

Conclusion And Discussion

The element has the highest needs is identifying talented people. According to Davies and Davies (2011) explained that identifying the talented person is the important role of school administrators. How to identify people who are doing a great job in their present role and how to help them to develop their potential is a vital process for the management of talent. The second element of needs is rewarding. According to Thome, Kaye, & Pellant, Andy (2007) suggested that the reward is associated with the assessment that talented people receive. Talented people want to be praised and admired for their success. So, the allocation awarded to people is so important. The third element of needs is developing talented people. According to Wichai Wongyai. [Mo.Po.Po]. explained that developing talented people is to increase knowledge, skill, abilities to plan, personal development training, in parallel with the operating. To evaluate the performance and potential of personnel to know who are the best people and then continue training and development, with both the knowledge, skills, expertise, operational or technical expertise. The fourth element of needs is retraining talented people. According to Davies and Davies (2011) suggested that retained people is important. Especially to communicate by talking to colleagues, the leadership skills needed to manage people in schools. Which held that expresses sincerity and build trust with colleagues or subordinates. The leader should demonstrate confidence in their abilities and competencies and a willingness to accept the opinions of others.

Acknowledgements

This research has been sponsored and supported by the Nongkhai Primary Educational Service Area Office 2 and The Graduate School of Khon Kaen University. The researchers would like to express their sincere gratitude and thanks to all of the supporters who have made large contributions towards the completion of this research.

New Approaches To Creativity In Music Education: Soundpainting In Teacher Training

Cristina Arriaga-Sanz, Baikune De Alba

cristina.arriaga@ehu.eus, baikune.dealba@ehu.eus

Abstract

The following research is motivated by the conviction that music and the arts in general should be present in teaching and learning activities, in such a way that is useful to and connected with student practices, trusting in the learner's ability to establish links, and to work in the face of uncertainty and surprise. A collaborative participation is taken as a fundamental when embarking on an exploration like this, which is both individual and collective. When creative activities are carried out in a group and the opportunities arise to improvise together, this all happens in real time, straight away: it occupies mind and body together, and signifies an understanding of content on different levels which move between social consensus and individual expression, and present children with the opportunity to take advantage of their own natural inclinations and fulfill different types of musical activities. In accordance with these premises, we carried out a case study on the training of music teachers, exploring collaborative practices using Soundpainting language with the aim of incorporating tools for creative learning. The research methodology is qualitative; it employs the analysis of student's diaries and group interviews. The main findings show that the application of the language of Soundpainting allows its participants to trust in their own creative capacity and in their possibilities to use this language as a source in their future practices.

Key words: *Creativity, music education, soundpainting, teacher training.*

Introduction

This study starts out from the desire to explore the potential role of improvisation and creativity as a vehicle for building new relations between students and music, for transforming the music room into a place where knowledge is conveyed in order to act and think, with the aim of liberating the mind (Kanellopoulos, 2007).

Experiences such as those carried out by Paynter (1992), Schafer (1965, 1986) and Delalande (1995, 2013) have been led by the conviction that unless children experiment, improvise and compose, music education will be dominated by structured sound exercises which are closed and exclusive. The focus of these composers and educators has been not only to discover children's creative potential but also to propose innovative approaches to the exploration of sound which will open the way towards every kind of music.

However, music education is dominated by technical concepts characterised by what Regelski (2002) calls methodolatry, giving undue importance to methods, which "limits the wide field of possibilities that can be applied in music education" (Loizaga, 2007, p. 216). As a consequence, the place and the role of improvisation in music education is not always addressed adequately. Experimentation and respect for the students' voices are key aspects in knowledge and skill acquisition; the desire to control, to predict what will happen, to know what works, derives from lineal, progressive processes which are an obstacle to critical questioning and fulfilling experiences. It is important that the teaching staff are prepared to ask themselves what they are teaching and why, to follow paths that their real-time exploration might take them, and to trust in their pupils' potential to build dialogues through improvisation. Equally, teachers need to feel comfortable working as co-musicians rather than instructors, enabling students to develop their intentions freely – both in terms of musical activities and discussions. It is not simply a question of including improvisation as a technique, focused on output, but rather of using it as a means or process through which to develop a way of thinking and acting (Burnard & Boyack, 2017) which is neither linked to nor restricted by any aesthetic limitations related to improvisation techniques (Kanellopoulos, 2007).

To this end, music teaching must be flexible and creative, and permit pupils to participate in a way that is spontaneous, as interpreters, composers, improvisers, and singer-songwriters, allowing music to help their emotional well-being and allowing young people to develop their imaginations and carry out activities for themselves (Burnard & Murphy, 2017). A fundamental condition for this is that music teachers trust in their own creative capacity and in their possibilities to act as a source of creativity and invite their future pupils to develop their imaginations, carrying out activities related to improvisation and creativity which will form a large part of their music classes. This means working towards a style of pedagogy based on principles – rather than set-pieces – in which the pupils can converse, create and lean on their own musical experience, knowledge and understanding, to participate, in a creative manner, in the here

and now (Burnard, 2017). Glover (2002) underlines the need to promote creativity with a demand that goes beyond technical skills, and connects with values, risk and courage. It is a question of seeing the primary classroom as a dynamic learning community founded on the supposition that creativity is a social and cultural construct in which the commitment to compose music on the part of teachers and pupils can be seen in and around their own personal spaces; it can additionally be seen as a classroom where the teacher generates the questioning and exploring of ideas while keeping options open (Burnard, 2017, p. 84). Odena and Welch (2012) also attach value to teachers being more open, not just when it comes to preparing the classroom environment, but when evaluating their students' work.

Along the same lines, the idea of free and collective improvisation designates a style of performance which does not have the objective of emulating determined musical styles but rather strives to experiment with sounds and techniques and ways of structuring sound, starting out with an idea that might be simple and then proceeding from there to explore sounds and the relations between sounds and musicians, as specific ways of being together in and through music. It is about developing an approach which looks to make music with children, instead of making music for children. The improvisatory process does not refer only to the realisation of a defined structure, or application of a pre-existing technique; it is an act of discovery with no aspirations beyond itself. An improvisation does not have a perfect model to aspire to; when you improvise, you are embarking on a series of musical actions which have a meaning beyond their realisation. The music speaks and then disappears. Improvisation conceived in this way has important educational implications since it presents a vision of learning which contrasts with the accumulation of abilities; the key to this learning is to look for ideas in situ, to trust in intuition and to develop the ability to respond to your own sounds and those of your classmates, with no other purpose than making them for their own sake, with no fixed expectation (Kanellopoulos, 2007).

From this perspective, there is a need, starting from the initial training of music teachers, to introduce new, experiential initiatives, which are articulated through creative, collaborative projects and accompanied by tools which prompt reflection and the interchange of ideas. It often happens that primary teachers, during their training, have not had the positive experiences which allow them to grow in confidence as teachers and creative people, and thus they encounter difficulties in carrying out their classes in this way. The teacher's job in the classroom is to contribute to the development of their pupils' creative abilities, stimulating them to generate ideas (Hickey, 2009; Giráldez, 2014), but it is evident that teachers require practice to help them with this. Carrillo and Vilar (2012) state that the skill relevant to the development of a person's ability to create music is one of the least utilised by teachers, arguing that the limited preparation received in the activity of creating music in their initial training could be partly responsible for its scarce use in practice. Koutsoupidou (2005), in her study of primary school teachers' work with improvisation, found that they were more likely to use it in their classes if this kind of activity had been a part of their higher education. According to Beineke (2017), several studies centred on composition exercises in music education have found that the lack of training and experience and the use of inadequate methodologies make it difficult to develop creative activities. All of which leads us to affirm the need to reinforce the level of preparation that teacher training programmes provide for music creation, with the objective of achieving the wider employment of this skill in a practical setting.

Soundpainting is a tool which provides for all of these premises. It is a language of gestures, created by Walter Thompson, which allows for improvisation and creativity in real time. The soundpainter, through set gestures, asks for a material with which to create a global proposal integrating the different contributions of the participants (Thompson, 2006). The learning of Soundpainting language starts out from a non-traditional area of music education, whereby the students learn the parameters of each gesture of the language of Soundpainting according to their abilities. Any student can participate, whatever their level of musical competence, which eliminates the barriers and learning norms. For Thompson (2009), it is fundamental that in musical learning we use who we are and what we already have inside us. He affirms that in order to interpret music, it is vital that the student uses their own skills, and does not focus on what they cannot do, and the language of Soundpainting fulfills this criterion. Its use in the ambit of education is conditioned in some way by the need to provide students with an environment in which they can express themselves with confidence through sound, movement and images. Wigram (2004) conceives musical education as the combination of sounds created from a setting of trust, and Burnard (2017) notes the need to communicate acceptance and to build a shared idea between teacher and pupil; Burnard, Boyack and Howell (2017) proffer suggestions for developing the composition process which begin with the idea of developing self-confidence, of making everyone feel that they are a composer: through exploring, experimenting, discovering, building, revising, interpreting, practising, collaborating and co-operating. In this sense, Soundpainting can also contribute in a positive way by generating a climate of trust, for both teacher and pupil (Bilgin & Çoşkuner, 2017), since one of its basic premises is that errors do not exist; any

material offered by the participants can be used by the Soundpainter, integrating it into their creative discourse, which thereby enables the participants to feel free to develop their creative powers.

Equally, Soundpainting allows for a multi-disciplinary use, offering the possibility of integrating simultaneously different artistic expressions: music, dance, drama, visual arts. If teachers in their initial training can gain a familiarity with this tool, it can help the understanding of their own sound experience through exploring with their own voice, with their body, with images or with instruments or sound objects, as well as boosting their interest in other forms of sound expression (Çoşkuner, 2016). In a Soundpainting performance, the participants' concentration grows and its practice contributes additionally to the development of their motor and improvisational abilities (Vidal & Morant, 2017). There is no avoiding the fact, also, that group improvisation signifies a complex and enriching artistic space for all involved; a space where, according to what is perceived, the different participants interact among themselves, and each one interprets what is happening in the moment of interpretation (Burnard, 2002; Burrows, 2004). In this sense, Soundpainting is conceived as an artistic conversation between the Soundpainter and the interpreters (Giacco & Coquillon, 2016), involving a collective action in which the group expresses itself through exploration and creativity – something which is especially relevant for our research.

To follow on, we should underline the main aim of this study which is to describe and analyse an experience that teacher training students in music have realised through Soundpainting language, both in their musical training and their future teaching work. From this general objective, the following specific objectives follow:

- To explore the possibilities of Soundpainting as a mean of improving the professional abilities of future music teachers in primary education.
- To investigate Soundpainting's suitability for the reinforcing of musical and creative abilities.

Contextualising the experience

The proposal was carried out with 29 students taking the subject of Instrumental Training, which is part of the final year of a teacher training degree, for those specialising in music. It began in September and ended in December. The students had no prior knowledge of Soundpainting and it was noted that their experience of creative activities in previous courses had been scarce. Yet they decided to work with this language and to link it to their future career.

We designed the activity through a collaboration with a music school and with four primary schools nearby, as well as with a Soundpainter to oversee the process. It was agreed that once they had internalised some beginner-level signs, the university students would go to those schools to practise them with the pupils. The work began with presenting the syntax of the language, which is articulated through four points: who, what, how, and when. The Soundpainter must use the signs in this order. However, the how is not always used by the Soundpainter, to give those interpreting more scope to improvise, to choose the tone and the quality of their production. The principles of Thompson's ideology (2006) were explained, and it was stressed that – in the event of any doubt – those interpreting should continue to create, regardless of the elements being used, unless they received a clear indication from the Soundpainter to pass to another sign. It was also stressed that there are no errors; if somebody accidentally interprets a different sign, they must continue with what they have understood until the next gesture. It was also highlighted that Thompson (2006) underlines the difference between conductor and Soundpainter: the former is an interpreter and the latter a composer. This is a crucial point because the students must understand this distinction in order to participate actively in the creative process. Subsequently, the students were gradually introduced to some basic, beginner's level gestures with which they carried out the first compositions. They reproduced the gestures at the same time as the teacher in order to integrate them better. After the first two sessions, they had the opportunity to take the place of the Soundpainter and to lead the class.

In these following sessions, they began to prepare the classes they were going to deliver at the primary schools. Working together, they designed the presentation of the language of Soundpainting, agreeing the signs they were going to produce, and establishing which ones they would work with for more musical concepts, related to sound parameters, different instruments, voice and body percussion and short musical phrases. They were introduced to signs related to elements such as the sounds of the wind, of laughter, of freezing. They also agreed on different strategies as regards the order of the presentation of the different signs and the incorporation of sound objects. In the university class sessions, they kept interchanging the roles of Soundpainter and interpreter in order to design a practical session and gain confidence in their potential. The school visits were a success since, because of the methodology applied, they had the opportunity to assume the teacher's role and the school pupils took on the instructions in a quick, intuitive

way. At the end of each session, the pupils noted what they had learned in their personal diaries, how it had been carried out, how they had felt, and the difficulties and positive aspects.

Running parallel to the work in the university classroom, we undertook an activity involving a small Soundpainting orchestra, meeting outside school hours and made up of teachers and pupils from the music school, the university and primary schools, as well as local actors and dancers. Given the interest this activity generated among the participants in the orchestra, a final performance was organized and the teachers and pupils of the primary schools were invited to take part altogether. Overall, the participants in this performance comprised a Soundpainter, university lecturers, music school teachers, and university and music school students – all of whom were involved in the Soundpainting orchestra – as well as 204 primary schoolchildren in the audience, and the experts in visual arts who were also taking part.

Research process

This research is presented as a case study, and a strategy that looks deeply into and delivers an exhaustive and holistic description of a single or multiple structure within a specific time frame (Creswell, 2013). In our research, we used two instruments for collecting data, the students' class diaries and group interviews. According to the ethical guidelines, we asked those participating for permission to carry out the study and divulge any information contributed, guaranteeing their anonymity. Twenty-nine people took part (20 women and nine men), all of them fourth-year students on the teacher training degree in Primary Education, specialising in music education, during the 2017/18 academic year.

In this study, the diary was used as an instrument for research and self-development, helping to give a structure to thoughts and experiences; additionally, it helped us with the collection of important data, and their analysis and systemisation (Jurado, 2011). In accordance with this, at the beginning of the course the students were asked to complete a diary after each session, making note of what they had learned and their experiences, thoughts and reflections. The objective was to understand the process experienced in the Soundpainting project, and the possible influence on each participant's creative and musical development and their future teaching work. Following Jurado (2011), we established the importance of showing and sharing with other colleagues the information gathered in the diaries; on top of this, a series of group interviews were recorded on video in which the students had the opportunity to discuss their experience together.

Prior to these group meetings, a series of initial categories was defined: the development of creative, musical and professional abilities. These were related to the research objectives and complemented the findings of the first analysis of the diaries, using a content analysis technique which involved grouping the data into different categories for analysis. The categorisation process consisted of looking for common themes which made it easier to obtain results related to the goals of the experience (Coffey & Atkinson, 2003). These categories, just as we will explain, were inductive-deductive; inductive, because they came out of the replies, and deductive because they were based on a literature review on Soundpainting.

Discussion of results

To carry out the analysis of the diaries and the group interviews, we performed an initial analysis which involved a detailed reading of the diaries and interview transcripts, allowing the participants' voices to emerge and making a first selection of the themes that kept on arising; this allowed us to put together a tool of data analysis and interpretation that we call the categorical system. This option is justified by our wish to integrate what happens in reality. At the same time, this was contrasted in a deductive way by the methodological principles that come from experience, generating an emerging categorical system.

Lastly, taking these defined categories and with the participants' voices behind it, we built a categorical system. In an attempt to respond to the objectives we had initially proposed, we proceeded to structure the results around three key elements, corresponding to the categorisation carried out: the development of creative, musical and professional abilities.

Table 1. Categories y subcategories referenced

CATEGORIES	SUBCATEGORIES	N° Diary references	N° Group interview references	N° Total references	%
Development of creative abilities		28	34	62	19.38%
	<i>Intuition</i>	4	9	13	4.06%
	<i>Freedom</i>	10	9	19	5.94%
	<i>Exploring sound material</i>	7	9	16	5.00%
	<i>Confidence in creative abilities</i>	7	7	14	4.38%
Development of professional abilities		95	108	203	63.44%
	<i>Autonomous learning</i>	5	6	11	3.44%
	<i>Co-operative learning</i>	14	10	24	7.50%
	<i>Language adaptation by levels</i>		7	7	2.19%
	<i>Ludic activity</i>	9	9	18	5.63%
	<i>Calmness</i>	3	8	11	3.44%
	<i>Confidence in teaching abilities</i>	15	12	27	8.44%
	<i>Responsibility</i>	1	4	5	1.56%
	<i>Memory</i>	1		1	0.31%
	<i>Attention</i>	8	3	11	3.44%
	<i>Innovation</i>	4	9	13	4.06%
	<i>Concentration</i>	1		1	0.31%
	<i>Exploring other roles (protagonist)</i>	13	10	23	7.19%
	<i>Motivator</i>	13	9	22	6.88%
	<i>Learning to listen</i>	3	9	12	3.75%
	<i>Diversity</i>	1	8	9	2.81%
	<i>Planning</i>	1		1	0.31%
	<i>Multi-disciplinary possibilities</i>	3	4	7	2.19%
Development of musical abilities		18	37	55	17.19%
	<i>Trying different instruments</i>	6	10	16	5.00%
	<i>Openness to other styles</i>	7	9	16	5.00%
	<i>Experimenting with music</i>	2	8	10	3.13%
	<i>Musical characteristics (sound parameters, musical syntax)</i>	3	10	13	4.06%
TOTAL		141	179	320	100%

The abilities that the students interviewed believe can be developed through this experience – in which Soundpainting plays a central role – are set out, as Table 1 shows, in three categories, as the following shows:

-Development of creative abilities. Through the analysis of the information gathered in the diaries and group interviews, we can see that this is regarded as a particularly valid experience for the development of these abilities (19.38%). Of these abilities, freedom was the subcategory that received most mentions (5.95%), followed by the opportunity presented to Explore sound material (5.00%) and Confidence in creative abilities (4.38%). The students' voices, both in the diaries and interviews, tell us that, while for some it was a relief that "errors do not exist", for others this was uncomfortable at first – especially for those with a more traditional musical background, in conservatories and music schools, where they learned to "repeat a repertoire". These students say that they are used to learning music through imitation and to playing with a score, meaning they found it difficult at first to improvise. However, after the first sessions, they began to feel more comfortable, and they believe it is a way of learning music that provides a lot of freedom, as well as the opportunity to interpret and experiment with different instruments even without the necessary technique.

-Development of professional abilities. This is the category which earns the highest number of references (63.44%). Within this category, Confidence in teaching abilities (8.44%) is mentioned the most, followed by Co-operative learning (7.50%), Exploring other roles (7.19%) and Motivator (6.88%). The school visit and opportunity to interact with pupils struck them as particularly enriching; they had previously enjoyed preparing for the visit, by allocating the different roles, practising the visit in class, working together in groups under their own initiative, interchanging ideas and possible sequences for the phrases, self-evaluating, and correcting. At the same time, Soundpainting enabled them to establish contact very quickly with the school pupils, who wanted to take part not only by interpreting but also by adopting the role of Soundpainter; all of which was pivotal in transmitting confidence to them in their role as teachers. The ludic quality of Soundpainting allowed it to be seen as a game, and this enabled a certain shedding of inhibitions; if some were shy at first, they teamed up in pairs and in the end everybody took part. Furthermore, they agreed that it was a highly motivating way of working with sounds, one that is open, dynamic and creative.

-Development of musical abilities. This category receives the third most references (17.19%). The highest number of statements regarding the subcategories concern Trying different instruments and Openness to other styles (5.00% each). The students experienced other possible forms of musical education – approaches that allow for more integration, and the incorporating of different levels of knowledge and ability into musical activities, as well as the exploring of ideas and processes and an openness towards all kinds of music. We wish to highlight also the fact they were struck by the speed with which they learned the gestures and were able to carry out musical productions. It helped them hugely – in a very intuitive fashion – to interiorise concepts such as sound parameters (intensity, pitch, tone, duration) and practise them.

Finally, we would like to underline that, according to the voices gathered, the act of delivering the final performance, with artists on the stage, allowed them to experience the integration of different artistic disciplines and this proved very enriching. Moreover, the characteristics of the language of Soundpainting enabled a manner of active participation that they had not known in any other type of show or concert. Equally, they said that they felt they had gained a freedom and certain complicity from meeting the primary-school pupils, thanks to the school visit, and sharing the experience of the concert with them. Additionally, they affirmed that the use of a diary as a tool for self-development, and the opportunity to visit the centres and teach Soundpainting to primary pupils, as well as to exchange experiences as a group and compare them with their colleagues and teachers, helped them to structure their thoughts and experiences – something which will be of great use to them in their future as teachers – as well as to reflect on and feel confidence in their creative possibilities.

Conclusions

The participants stated that this educational process had developed their sensitivity with regards to understanding how to relate to students creatively. They also said that the act of getting involved in activities with primary school pupils, and with a Soundpainting orchestra, and feeling like participants in a collective project, had helped them to feel engaged and confident about developing their professional work in a way that encourages innovation and integration.

The application of the language of Soundpainting provided tools to guide future teachers in the design and implementation of projects which promote collective creativity, the generation of ideas, and the ability to organize events based on the creative processes. The implementation of this experience allowed its participants to open their

minds as well as offering norms to change ways of thinking and moving forward with the creative and musical training of future teachers. Soundpainting is a way of focusing teaching on the recognition of the quality of the process of artistic creativity, rather than the analysis of the final product. It makes it possible to understand creativity as an activity which develops different abilities and critical thought in a collaborative space. To conclude, we will note the words of one student after his first Soundpainting class:

“None of us knew anything about this language but it was clear that, as well as surprising us and having an impact on us, it succeeded in motivating us and we actually enjoyed the music. With Soundpainting we can learn to listen, and promote group work, improvisation and real-time composition. What is more, we were able to become composers and lead a group – and if it had an impact on me, imagine how a child might experience it! ... Through this language we will succeed in integrating diversity and opening the limits of children’s imaginations.”

Abstract

Il documento tratta delle prospettive di utilizzo di un'app Web (GeoBes), appositamente realizzata per questo scopo, nell'ambito dell'educazione ambientale. La metodologia di approccio proposta si basa sulla Neogeografia che consiste in un insieme di tecniche e strumenti che non rientrano nel campo del GIS tradizionale, Geographic Information Systems (Turner, 2006, p.2). In questo senso, GeoBes funge da risorsa didattica e come strumento per la promozione dei processi di apprendimento, inoltre, l'App Web è stata progettata per includere anche bambini SEN (bisogni educativi speciali) nello studio della geografia nei contesti di istruzione a distanza. L'app utilizza una metodologia basata sull'apprendimento ludico, con una serie di attività che consentono un apprendimento significativo, attraverso la visualizzazione e la localizzazione virtuale di mappe di aree geografiche specifiche. In particolare, il tema del percorso di educazione ambientale sarà il fiume Irno, che attraversa la città di Salerno (Italia). Il fiume sarà indagato da diverse prospettive che ne individuano le caratteristiche fisico-geografiche e come bene comune da tutelare nell'interesse della sostenibilità intergenerazionale.

Obstetric Triage Acuity Scale Setting To Turkish

Abstract

The rate of maternal mortality in the world and our country is unacceptably high. Women die as a result of complications during and after pregnancy and delivery. Most of these complications develop during pregnancy and many can be prevented or treated. In protecting maternal health, it is vital that obstetric problems can be identified at the earliest time and appropriate treatment and care can be provided. In order to prevent maternal / mortality and morbidity, it is inevitable to develop a triage scale specific to obstetric acuity in order to ensure that health personnel are able to perform the earliest and appropriate intervention in an emergency obstetric situation or, if necessary, refer the patient to the procedure promptly. In Turkey, there is no nationally accepted classification system for the standardization of obstetric triage of patients coming to the complaint. The purpose of this study is to plan the language validity and coverage of the obstetric triage urgency scale. The study was conducted between 01.01.2018 and 30.03.2018 at Akdeniz University Hospital Emergency Service Triage Unit in Antalya city center. Statistical Package for the Social Sciences (SPSS) 20.0 software package program was used to analyze the data obtained from the research. For this study, the language expression content index is 0.983 and the scale content index is 0.8636. As a result, the language expression content index for this study is 0.983, it has a very high content content validity, and the scale content index is 0.8636 in terms of language expression, and our scale has a content validity close to perfection.

Keywords: *Obstetric triage acuity scale, Obstetric emergencies, Obstetric triage, Triage.*

Introduction

Triage is the process of prioritization of healthcare services according to the urgency of the care and treatment needs of the patient and is often used in healthcare for emergencies (Evans et al., 2015). The development of the emergency care triage system allows standardization of care and better utilization of resources (Gratton et al., 2016), while determining which patients should be evaluated urgently and which can be safely waited for. Standard workflows and acuity indexes benefit the nursing profession by creating standards and expectations. Patient care is elevated through the practice of the nursing staff measuring, monitoring, and disseminating patient care quality indicators and metrics, and working to continuously improve patient outcomes (DePaoli, 2016). Emergency triage used in the literature; Canadian Triage Acuity Scale (CTAS), Emergency Severity Index (ESI) and Manchester Triage System (Mackway-Jones, 1997; Eitel et al., 2003; Bullard, Unger, Spence, Grafstein, 2008). These scales include limited practice for obstetric triage and do not reflect special triage needs of obstetric patients. The Association of Women's Health, Obstetric, and Neonatal Nurses (AWHONN, 2016), has also created a 5-level obstetric acuity index tool. The Obstetric Triage Acuity Scale (OTAS) has been developed because of the limited obstetric markers of triage clearness scales (Smithson, 2013). OTAS was modeled on 5 categorized CTAS instruments and Smithson et al. (2013). Obstetric triage is the entry into labor and delivery and the obstetric operating rooms, and patients should be evaluated for life-threatening risk factors and dangers immediately upon arrival, rather than waiting to be seen on a first-come-first-served basis. The implementation of obstetric triage standards and the utilization of an obstetric triage index have the potential to dramatically increase throughput, patient outcomes, patient safety, and patient satisfaction (DePaoli, 2016). In protecting maternal health, it is vital that obstetric problems can be identified at the earliest time and appropriate treatment and care can be provided. In order to prevent maternal / mortality and morbidity, it is inevitable to develop a triage scale specific to obstetric acuity in order to ensure that health personnel are able to perform the earliest and appropriate intervention in an emergency obstetric situation or, if necessary, refer the patient to the procedure promptly. In Turkey, there is no nationally accepted classification system for the standardization of obstetric triage of patients coming to the complaint.

Methods

This study was planned with the aim of adapting the obstetric triage acuity scale to Turkish. The data of the methodological planned study was collected between 01.01.2018-30.03.2018 at the Akdeniz University in the city center of Antalya. The "Obstetric Triage Acuity Scale" (OTAS) was used for the collection of research data. Studies have been carried out on the language availability and content validity of the Obstetric Triage Acuity Scale. Statistical Package for the Social Sciences (SPSS) 20.0 software package program was used to analyze the data

obtained from the research. Permission was obtained from the Ethics Committee of the Institute of Health Sciences of the Akdeniz University before the research started.

Otas

Obstetrical Triage Acuity Scale, a five-category (1-resusitative, 2-emergent, 3-urgent, 4-less urgent, 5-nonurgent) triage acuity scale with a complete set of obstetrical determinants. The scale consists of triage-focused segments of the patient's assessment time, medical complications, and complaints of obstetric determinants (Smithson et al., 2013). In 2016, the National Triage Working Group finalized OTAS with the addition of substance use and mental health assessment. Gratton et al. (2016) added the final chapter with the aim of supporting the determination of the urgency level of the assessors. The last section included the haemodynamic status of the patient (shock), respiratory stress, fetal evaluation (fetal heart rate, meconium in the amnion fluid) and cervical dilatation evaluation (Gratton et al., 2016). In the original scale, kappa was found to be OTAS 1-4 0.61-0.77 and OTAS 5 0.87 (Smithson et al., 2013).

Results

Language Validity

After the Turkish translation of the Obstetric Triage Emergency Scale was made by the researcher, the scale was translated from English to Turkish by three teaching staff who knew two languages (English / Turkish). After the translations were organized by the researcher and consultant lecturer, Scale Turkish form was created. The "blind back translation" method was used in the scale language adaptation. The translation of the scales into English was done by a lecturer at the Faculty of Foreign Languages of Akdeniz University. After the translation work done, the scale was sent to the author. The necessary corrections have been made in the direction of the suggestions coming from the author and the scale has been finalized.

Internal validity

Expert opinion has been referred to evaluate the internal validity of OTAS. The Turkish form of the completed scale was requested from 8 faculty members who were experts in the field. In evaluating the expert opinion, the Content Validity Index was used. The content validity index was used in the evaluation of expert opinions. The evaluation of the validity of this index, developed in 1983 by Waltz and Bausell is made in the form of 4 likert type. In Likert 1, "very change is necessary" (2) "little change is required" (3) "appropriate", 4 "very appropriate" (Polit and Beck, 2006). The descriptive statistics of the scores given by the experts to each item of the scale are presented in Table 1. In this table, it is seen that the average scores of the expert points are between 3-4, and the minimum values are between 2 and 4 and the maximum values are all 4.

Table 1. Descriptive statistics of the scores of the experts

	N	Ort.	Ss	Min.	Max
S1	8	3.7500	.46291	3.00	4.00
S2	8	4.0000	.00000	4.00	4.00
S3	8	3.7500	.46291	3.00	4.00
S4	8	3.8750	.35355	3.00	4.00
S5	8	3.1250	.35355	3.00	4.00
S6	8	3.6250	.51755	3.00	4.00
S7	8	3.7500	.46291	3.00	4.00
S8	8	3.3750	.51755	3.00	4.00

S11	8	3.3750	.51755	3.00	4.00
S12	8	3.7500	.46291	3.00	4.00
S13	8	3.6250	.51755	3.00	4.00
S14	8	3.2500	.70711	2.00	4.00
S15	8	3.5000	.53452	3.00	4.00
S16	8	3.3750	.74402	2.00	4.00
S17	8	3.8750	.35355	3.00	4.00
S18	8	3.8750	.35355	3.00	4.00
S19	8	3.5000	.53452	3.00	4.00
S20	8	4.0000	.00000	4.00	4.00
S21	8	3.6250	.51755	3.00	4.00
S22	8	3.5000	.53452	3.00	4.00

Content validity index; substance validity index and for the whole scale. The item content index is found by dividing the number of experts who score 3 or 4 points for each item by the total number of experts. If there are 6

or more experts, it means that the item content index (I-CVI) is 0.78 and above, and that the scale has excellent article content validity (Polit and Beck, 2006). The language expression content index for this study is 0.983 and it can be said that it has a very high content content validity.

Scale content validity index; is calculated by dividing the number of items given by 3 or 4 points for each expert by the total number of items. In the content analysis of the scale, the scale content validity index (S-CVI) can be accepted between 0.80-0.90 and it can be said that the scales having 0.90 and above have excellent content validity (Polit and Beck, 2006). In this study, the scale content index is 0.8636 in terms of language expression and our scale has the content validity of a scale close to perfection.

In addition to the average scores of the experts in the survey, the suggestion of the expression style and content of the items was also evaluated. In line with the views and suggestions of the Prime Minister, 1., 4., 5., and 14th items have been rearranged, the scales have been finalized with various additions / subtractions to provide semantic integrity and on-the-ground reliability.

Conclusion

As a result, the language expression content index for this study is 0.983, it has a very high content content validity, and the scale content index is 0.8636 in terms of language expression, and our scale has a content validity close to perfection.

buket@cankaya.edu.tr

Hikmet Uğur ÖNER
oner@cankaya.edu.tr

Özet

Günümüzde internet kullanımındaki artış, yaşamımızda sağladığı kolaylıklar interneti vazgeçilmez konumuna sokmuştur. Türkiye İstatistik Kurumu (TÜİK) (2017) hanehalkı bilişim teknolojileri kullanım araştırması sonuçlarına göre, bilgisayar ve internet kullanımı 2017 yılında 16-74 yaş grubundaki bireylerde sırasıyla yüzde 56,6 ve yüzde 66,8'dir. Aynı araştırma sonuçlarına göre 2017 yılı Nisan ayında hanelerin yüzde 80,7'si evden internete erişim imkânına sahip.Türkiye'deki Dijital Dünyaya Genel Bakış (2018) istatistikleri 81 milyon nüfusa sahip ülkemizde; nüfusun % 67'sini oluşturan 54.3 milyon internet kullanıcısı ve İnsanlar internette günde ortalama 7 saat geçiriyorlar. Son yıllarda artan internet kullanımının bilgiye kısa sürede erişim imkanı sunma, hizmetlerin sunumunda zaman ve maliyet açısından ekonomiklik sağlama gibi özellikleri internete olan ilgiyi ve kullanımını artırmıştır. Teknolojik gelişmeler yaşamımızı kolaylaştırdığı kadar beklenmedik güçlükleri de beraberinde getirmiştir. İnternet bağımlılığı da bunlardan biridir. İnternet bağımlılığı her yaşta görülebilmekte ancak diğer bağımlılıklara göre daha erken yaşlarda başlamakta. İnternet bağımlılığı kısaca, İnternetin aşırı kullanılması isteğinin önüne geçilememesi, internete bağlı olmadan geçen zamanın önemini yitirmesi, yoksun kalındığında ise aşırı sinirlilik hali ve saldırgan olunması olarak tanımlanır. Bu sorunun çözümünde okul yöneticileri, okul PDRM ve eğitim koordinatörlüklerine büyük sorumluluklar düşmektedir. Kuşkusuz bu süreçte okulların ailelerle işbirliği, ailelerin bilinçlendirilmesi, öğrencilerin bilgilendirilmesi ve bilinçlendirilmesine destek olacaktır. Bu çalışmada Özel Arı Okullarında okul yönetimi ve PDRM işbirliğiyle yürütülen İnternet Bağımlılığını Önleme çalışmaları özellikle de veli bilinçlendirme boyutu anlatılacaktır.

Okullarda Örgütsel Yenilik Düzeyi İle Örgütsel Bağlılık Düzeyi Arasındaki İlişki

Emrah DÖNMEZ
Milli Eğitim Bakanlığı

Abbas ERTÜRK
Eğitim Yönetimi, Teftişi, Planlaması ve Ekonomisi Bilim Dalı Muğla Sıtkı Koçman Üniversitesi

Özet

Bu çalışmada, okul yöneticilerinin örgütsel yenilik düzeyleri ile öğretmenlerin örgütsel bağlılık düzeyi arasındaki ilişkinin belirlenmesi amaçlanmıştır. Araştırmanın evrenini 2017-2018 eğitim öğretim yılında Muğla il merkezi ve ilçelerindeki ilköğretim, ortaokul ve liselerde görev yapan öğretmenler oluşturmaktadır. Tarama modelinde yapılan araştırmanın örneklemini 418 öğretmenden oluşmaktadır. Araştırmada, Eğitim Örgütleri İçin Yenilik Yönetimi Ölçeği ve Örgütsel Bağlılık Ölçeği kullanılmıştır. Araştırmanın sonuçlarına bakıldığında, öğretmenlerin görüşlerine göre okul yöneticilerinin yenilik yönetimi davranışı boyutlarının, öğretmenlerin örgütsel bağlılık düzeylerini tüm boyutlarda anlamlı şekilde yordadığı söylenebilir. Öğretmenlerin örgütsel bağlılık davranışını arttırmak için okul yöneticilerinin daha çok yenilikçi davranışlar sergilemesi önerilebilir.

Anahtar kelimeler: Örgütsel yenilik, örgütsel bağlılık, yenilik yönetimi, öğretmen, yönetici

Giriş

Örgüt kavramı sosyoloji, psikoloji, antropoloji, siyaset bilimi, yönetim bilimleri gibi birçok sosyal bilimlerin alanına giren bir kavramdır (Şişman, 1995). Genel olarak bakıldığında örgüt, belli ortak amaçlara ulaşmak için oluşturulan canlı yapılardır. Örgüt içinde örgüt üyeleri, örgütün amaçlarına ulaşması için çalışırken kendi özel amaçlarına ulaşmayı da hedeflerler. Örgütün bu hedeflere ulaşabilmesi için de birçok etkenin doğru şekilde yönetilmesi gerekir.

İnsan yaşamı sürekli bir değişim ve gelişim halindedir. Gelecek kestirilemeyecek kadar belirsiz olsa da, insanlar sürekli ve gittikçe hızlanan bu değişimin arkasından gitmek zorundadır (Töremen, 2002). Bu hızlanan değişim ve gelişimin en önemli sebebi ve sonucu teknolojidir, çünkü teknoloji iletişimi kolaylaştırmış ve bilgiyi daha rahat ulaştırılabilir hale getirmiştir. Bu da insanların ve kurumların kendilerini daha kolay geliştirmesini mümkün kılarak, neredeyse tüm sektörlerde rekabet ortamlarının oluşmasına sebep olmuştur (Öğüt, Aygen, ve Demirel, 2007). Rekabetin ön plana çıkması örgüt içindeki kişilerin iş performanslarının ve performanslarını etkileyen unsurların da beraberinde inceleme konusu olmasını sağlamıştır. Özel sektörde ve kamu kurumlarında çalışan tüm personelden performans beklentisi artmıştır. Kişilerin işyerindeki verimliliğini arttırmada önemli unsurlardan olan kişinin çalıştığı yere bağlılığı ve örgütteki lider durumunda olan kişilerin yeniliğe açık olması, örgüte yeni şeyler kazandırabilecek nitelikte olması önemlidir.

Yenilik ve yenilikçilik, örgütlerin değişen zamana ve çevreye uyum sağlayabilmesi için gereklidir. Yenilik, örgütlerdeki çalışanların yetkin kişilerden oluşması ve örgütlerin hitap ettiği kitlenin gözünde popülerliğini yitirmemesi için önemli bir unsurdur (Bozkurt, 2015). Yapılan araştırmalar da bunu destekler niteliktedir. Bu araştırmalardan birisi de Yavuz'un (2010) araştırmasıdır. Yavuz (2010), bir örgüt üzerinde yaptığı çalışmada örgütte yapılan yenilikler ile örgüt performansı arasında anlamlı bir ilişki olabileceğini ortaya koymuştur.

Her alanda olan değişim ve gelişim hem insanları hem de toplumu değiştirmeye ve yenilemeye zorlamaktadır. Eğitim kurumları da tüm alanlara kaynak sağlayan kurumlar olarak yeniliğe ihtiyaç duymaktadır. Eğitim örgütleri tüm bilimsel, teknolojik, çevresel değişim, gelişim ve yeniliklerden etkilenmektedir (Göl ve Bülbül, 2012). Bu değişim ve gelişime ayak uydurma sürecinde en büyük rol eğitim örgütlerinde lider konumunda olan kurum yöneticilerine düşmektedir. Öncelikli olarak yöneticinin yeniliği yönetebilmek için birçok boyutta yeterli olması beklenir. Özellikle de örgüt içinde liderin girdi yönetimini iyi yapması, birtakım yenilik stratejilerini uygulaması, örgütün kültür ve yapısının yeniliğe açık olmasını sağlaması ve örgüt üyelerini bir arada ve aktif tutmak adına proje yönetimini iyi yapması gerekir.

Örgütsel bağlılık örgüt üyelerinin dâhil olduğu gruba bağlılığıdır. Kişinin örgüte olan bağlılığını etkileyen kendisinden ve örgütten kaynaklanan birçok faktör vardır. Bu faktörlerden öne çıkanlar kişinin yaşı, eğitim düzeyi, görev süresi ve yapılan işin ücret düzeyi, örgütün büyüklüğü ve yapısı, örgüt, içinde uygulanan liderlik stili, örgüt içi ödüllendirme, sosyal ilişkiler, örgütsel adalet düzeyi şeklinde sıralanabilir.

Örgütsel bağlılık eğitim örgütlerinde incelediğinde, öğretmenlerin örgüte olan bağlılığının eğitim öğretim faaliyetlerini de olumlu etkilemesi beklenir. Okullarda öğretmenlerin örgütüne bağlılık davranışı göstermesi,

onların okulda daha çok vakit geçirmesini, öğrencileri ve örgütü için daha çok çalışmasını beraberinde getirir. Bu da örgütsel bağlılığın görüldüğü eğitim örgütünün başarı durumunun daha iyiye gitmesini sağlayabilir. Okullardaki örgütsel bağlılığa araştırmalar üzerinden bakılacak olursa, Atik ve Üstüner (2014) tarafından ilköğretim okullarının örgüt tipi ile öğretmenlerin örgütsel bağlılıkları arasındaki ilişkinin incelendiği bir araştırma yapılmıştır. Bu araştırmada araştırmaya katılan öğretmenlerin okullarına orta düzeyde bağlılık gösterdiği sonucu çıkmıştır. Araştırmaya katılan öğretmenlerin örgütsel bağlılık düzeylerinde cinsiyet ve mesleki kıdem değişkenleri açısından anlamlı fark görülmüştür. Gönen'in (2016) öğretmenlerin örgütsel bağlılık düzeyleri ile karar verme süreci arasındaki ilişkiyi incelediği bir araştırmada, öğretmenlerin örgütsel bağlılık düzeyleri ile karara katılma süreçleri arasında pozitif yönde, orta düzeyde anlamlı bir ilişki olduğu sonucu çıkmıştır.

Örgüt liderinin tutumuna göre örgüt üyelerinin bağlılık düzeyleri artar ya da azalabilir. Eğitim örgütlerinde okul yöneticilerinin yeniliğe yaklaşımları ve yenilikçi tutumları öğretmenlerin örgütsel bağlılık düzeylerini önemli derecede etkileyebilir çünkü yenilikçi tutumun örgütün gelişimini olumlu yönde etkilemesi ve örgüt üyelerinin örgütüne olan bağlılığını arttırması beklenir. Okul yöneticisinin yeniliğe açık olması örgüt içinde bulunduğu kısır döngünün dışına çıkmasını ve örgüt olarak çeşitli başarılarla imza atmasını sağlayabilir. Bu da öğretmenlerin motivasyonunu olumlu yönde etkileyerek örgüt içinde mutlu olmasını, örgüt içinde daha çok zaman geçirmesini, işe zamanında gelmesini ve örgüt için birşeyler yapmaktan haz duymasını sağlayabilir.

Alanyazın araştırması sürecinde eğitim örgütlerinde örgütsel yenilik ve örgütsel bağlılık arasındaki ilişki üzerine yapılmış bir çalışmaya rastlanmamıştır. Ancak otomotiv sektöründe Zerenler ve Celep (2011) tarafından yapılan araştırmada yenilik ve yenilikçiliğin arttırılabilmesi için örgüt üyelerinin örgüte olan bağlılığının arttırılması gerektiği ve örgüt liderlerine bu konuda büyük görev düştüğü sonucu çıkarılmıştır. Zannad ve Rouet (2003) tarafından yapılan bir çalışmada da örgütsel bağlılığın yenilikçi örgüt yapılarında daha etkili olduğu ancak örgüt üyelerinde belli düzeyde de sadakat eksikliğine görüldüğü belirtilmiştir.

Eğitim örgütlerinde örgütsel yenilikle ilgili yapılan az sayıda çalışma vardır. Araştırma sırasında ise eğitim örgütlerinde örgütsel yenilik ile örgütsel bağlılık arasındaki ilişkiyi inceleyen hiçbir çalışmaya rastlanmamıştır. Bu nedenle eğitim örgütlerinde ayrı ayrı araştırılmış olan örgütsel yenilik ve örgütsel bağlılık değişkenleri arasındaki ilişki, araştırmacı için merak haline gelmiş ve araştırma konusu olarak bu bağlamda olgunlaşmıştır.

Bu araştırmada ilkökul, ortaokul ve liselerde görev yapan okul yöneticilerinin örgütsel yenilik düzeyleri ve öğretmenlerin örgütsel bağlılık düzeylerinin incelenmesi hedeflenmiştir. Buna uygun olarak aşağıdaki sorulara cevap aranmıştır.

- 1) Öğretmenlere göre okul yöneticilerinin örgütsel yenilik düzeyleri nedir?
- 2) Öğretmenlerin örgütsel bağlılık düzeyleri nedir?
- 3) Okul yöneticilerinin örgütsel yenilik düzeyi demografik değişkenlere göre farklılık göstermekte midir?
- 4) Öğretmenlerin örgütsel bağlılık düzeyleri demografik değişkenlere göre farklılık göstermekte midir?
- 5) Okul yöneticilerinin örgütsel yenilik düzeyleri ile öğretmenlerin örgütsel bağlılık düzeyleri arasında anlamlı bir ilişki var mıdır?

Yöntem

Araştırmanın Modeli

Okul yöneticilerinin öğretmenlere göre örgütsel yenilik düzeylerinin ve öğretmenlerin örgütsel bağlılık düzeylerinin çeşitli değişkenlere göre incelenmesinin ve ikisinin arasındaki ilişkinin incelenmesinin amaçlandığı bu araştırma ilişkisel-tarama modelinde yapılmıştır.

Evren ve Örneklem

Bu araştırmanın evreni 2017-2018 eğitim-öğretim yılında Muğla il merkezi ve ilçelerinde ilkökul, ortaokul ve liselerde görev yapan 12.056 öğretmenden oluşmaktadır. Örneklemen belirlenmesinde küme örnekleme tekniği kullanılmıştır. Evreni temsil eden örneklem sayısını hesaplanırken Şahin'in (2014, s.127) $\alpha=0,05$ için hazırlamış olduğu ideal örneklem büyüklüklerini gösteren tablodan faydalanılmıştır. Örneklem büyüklüğü %95 güven düzeyi için en az 378 olarak hesaplanmıştır. Bu araştırmada 418 katılımcıya ulaşılmış ve bu katılımcıların görüşleri değerlendirmeye alınmıştır.

Veri Toplama Araçları

Bu araştırmada kullanılan ölçek üç bölünden oluşmaktadır. Birinci bölümde katılımcıların demografik bilgileri istenmiştir. İkinci bölümde okul yöneticilerinin örgütsel yenilik düzeylerini belirlemek amacıyla öğretmenlere "Eğitim Örgütleri İçin Yenilik Yönetimi Ölçeği" uygulanmıştır. Bu ölçek Bülbül (2012b) tarafından geliştirilmiştir. Ölçek dört boyut ve 32 maddeden oluşmaktadır. Cronbach Alfa iç tutarlılık güvenilirlik katsayısı ise .96 olarak bulunmuştur. Bu ölçeğin birinci boyutu *girdi yönetimi* (5 madde) ($\alpha=0,91$), ikinci boyutu *yenilik*

stratejileri (6 madde) ($\alpha=0,92$), üçüncü boyutu *örgütsel kültür ve yapı* (6 madde) ($\alpha=0,94$) ve dördüncü boyutu *proje yönetimi* (15 madde) ($\alpha=0,97$)’dir. Bu araştırmada ise Cronbach Alfa iç tutarlılık güvenirlik katsayısı .98 olarak hesaplanmıştır. Üçüncü bölümde öğretmenlerin örgütsel bağlılık düzeylerini belirlemek amacıyla “Örgütsel Bağlılık Ölçeği” kullanılmıştır. Bu ölçek Balay (2000) tarafından geliştirilmiştir. Bu araştırmada ölçeğin birinci boyutu *uyum* (8 madde) ($\alpha=.84$), ikinci boyutu *özdeşleşme* (8 madde) ($\alpha=.88$) ve üçüncü boyutu *içselleştirme* (11 madde) ($\alpha=.92$)’dir. Bu araştırmada Cronbach Alfa iç tutarlılık güvenirlik katsayısı .81 olarak hesaplanmıştır.

Verilerin Analizi

Araştırmadan elde edilen verilerin dağılımının normalliği çarpıklık ve basıklık katsayılarına bakılarak test edilmiştir. Çarpıklık katsayılarının tüm değişkenlerde -0.37 ile +0.74 arasında değiştiği; basıklık katsayılarının ise 0,10 ile 0,76 arasında değiştiği görülmüştür. Bu değerler +1.5 ile -1.5 aralığında olduğu için dağılım normal kabul edilmiştir (Büyükoztürk, 2015; Tabachnick ve Fidell, 2013).

Örgütsel Bağlılık düzeyini belirlemek için kullanılan ölçek 3 boyuttan oluşmuş olup, birinci boyutunda bulunan maddeler ters kodlanmıştır. Katılımcılara ait kişisel bilgiler yüzde ve frekanslarına bakılarak analiz edilmiştir. Ortalamalara ilişkin karşılaştırmalarda t-testi, ANOVA analizlerinden yararlanılmıştır. ANOVA analizlerinde ortaya çıkan farklılıkların yorumlanması için Tukey veya Games-Howell testleri kullanılmıştır. Bunun için verilerin homojenlik testi yapılmıştır. Bu test sonucunda homojen dağılım varsayımını sağlayan değişkenlerde Tukey testi, bu varsayımı sağlamayan değişkenlerde ise Games-Howell testi yapılmıştır (Tabachnick ve Fidell, 2013). Ölçeklerden elde edilen verilerin ortalamalarını değerlendirebilmek için (4/5) formülüne göre sınırlar belirlenmiştir. Bu sınırlar, (1,00-1,80) hiç, (1,81-2,60) az, (2,61-3,40) orta, (3,41-4,20) çok ve (4,21-5,00) tam şeklindedir. Regresyon analizi için kullanılan değerler ise (0-0.3) düşük, (0.3-0.7) orta, (0.7-1.0) yüksek şeklindedir.

Bulgular

Bu araştırmanın ilk amacı, öğretmenlere göre okul yöneticilerinin örgütsel yenilik düzeylerinin belirlenmesidir. Araştırmaya katılan öğretmenlerin görüşlerine göre okul yöneticilerinin yenilik yönetimi davranışının boyutlarına ilişkin ortalamalar Tablo 1’de verilmiştir.

Ölçekler	Boyutlar	\bar{X}	S
Yenilik Yönetimi	Girdi Yönetimi	3.80	.87
	Yenilik Stratejileri	3.86	.79
	Örgütsel Kültür ve Yapı	3.89	.85
	Proje Yönetimi	3.85	.78

Tablo 1. Okul Yöneticilerinin Yenilik Yönetimi Davranışının Boyutlarına İlişkin Ortalamalar

Araştırmanın ikinci amacı, öğretmenlerin örgütsel bağlılık düzeylerinin belirlenmesidir. Öğretmenlerin örgütsel bağlılık davranışının boyutlarına ilişkin ortalamalar Tablo 2’de verilmiştir.

Ölçekler	Boyutlar	\bar{X}	S
Örgütsel Bağlılık	Uyum	1.96	1.13
	Özdeşleşme	3.47	.78
	İçselleştirme	3.72	.68

Tablo 2. Öğretmenlerin Örgütsel Bağlılık Davranışının Boyutlarına İlişkin Ortalamalar

Araştırmanın üçüncü amacı öğretmenlerin görüşlerine göre okul yöneticilerinin örgütsel yenilik davranışının öğretmenlerin demografik değişkenlerine göre incelenmesidir. Öğretmenlerin cinsiyetine göre okul yöneticilerinin yenilik yönetimi davranışının ortalamalarının girdi yönetimi boyutunda erkekler için ($\bar{x}=3.74$), kadınlar için ($\bar{x}=3.84$); yenilik stratejileri boyutunda erkekler için ($\bar{x}=3.81$), kadınlar için ($\bar{x}=3.90$); örgütsel kültür ve yapı boyutunda erkekler için ($\bar{x}=3.86$), kadınlar için ($\bar{x}=3.92$); proje yönetimi boyutunda erkekler ve kadınlar için ($\bar{x}=3.85$) olduğu görülmektedir. Hiçbir boyutta okul yöneticilerinin genel örgütsel yenilik düzeylerinde öğretmenlerin cinsiyetlerine göre anlamlı bir farklılık görülmemektedir.

Alan değişkenine göre incelendiğinde, öğretmenlere göre okul yöneticilerinin yenilik yönetimi davranışının boyutları; girdi yönetimi [$F(3, 390)=1.31, p>0.05$], yenilik stratejileri [$F(3, 390)=0.94, p>0.05$], örgütsel kültür ve yapı [$F(3, 390)=1.26, p>0.05$] ve proje yönetimi [$F(3, 390)=1.43, p>0.05$] düzeylerinde öğretmenlerin alanlarına

göre anlamlı bir farklılık görülmemektedir. Öğretmenlere göre, okul yöneticilerinin yenilik yönetimi davranışına genel çerçevede bakıldığında yine öğretmenlerin alanlarına göre anlamlı bir fark görülmemektedir [$F(3, 390)=1.10, p>0.05$]. Bu sonuçlara göre, öğretmenlerin alan değişkeninin, okul yöneticilerinin yenilik yönetimi davranışının algılanmasında önemli bir değişken olmadığı ifade edilebilir.

Okul türü değişkenine göre incelendiğinde, öğretmenlere göre okul yöneticilerinin yenilik yönetimi davranışının boyutları; girdi yönetimi [$F(2, 410)=1.95, p>0.05$], yenilik stratejileri [$F(2, 410)=0.43, p>0.05$], örgütsel kültür ve yapı [$F(2, 410)=1.29, p>0.05$] ve proje yönetimi [$F(2, 410)=1.60, p>0.05$] düzeylerinde öğretmenlerin çalıştığı okul türüne göre anlamlı bir farklılık görülmemektedir. Öğretmenlere göre, okul yöneticilerinin yenilik yönetimi davranışına genel çerçevede bakıldığında yine öğretmenlerin çalıştığı okul türüne göre anlamlı bir fark görülmemektedir [$F(2, 410)=0.60, p>0.05$]. Bu sonuçlara göre, öğretmenlerin okul türü değişkeni, okul yöneticilerinin yenilik yönetimi davranışını algılamasında önemli bir değişken olmadığı ifade edilebilir.

Kıdem yılı değişkenine göre incelendiğinde, Yenilik stratejileri boyutunda [$F(4, 408)=2.88, p<0.05$] anlamlı farklılık görülmektedir. Bu testin sonuçlarına göre yenilik stratejileri boyutunda kıdemleri 0-5 yıl ve 21 yıl ve üzeri olan öğretmen grupları arasında fark görülmektedir. Buna göre kıdemi 0-5 yıl arasında olan öğretmenlerin yenilik stratejileri algı düzeyleri, kıdemi 21 yıl ve üzeri olan öğretmenlerin algı düzeyinden daha yüksektir.

Öğretmenlere göre okul yöneticilerinin yenilik yönetimi davranışının boyutları; girdi yönetimi [$t(412)= .77, p>0.05$], yenilik stratejileri [$t(412)= 1.41, p>0.05$], örgütsel kültür ve yapı [$t(412)= 0.14, p>0.05$] ve proje yönetimi [$t(412)= 1.80, p>0.05$] düzeylerinde öğretmenlerin eğitim durumlarına göre anlamlı bir farklılık görülmemektedir. Öğretmenlere göre, okul yöneticilerinin yenilik yönetimi davranışına genel çerçevede bakıldığında yine öğretmenlerin eğitim durumuna göre anlamlı bir fark görülmemektedir [$t(412)= 1.53, p>0.05$]. Bu sonuçlara göre, öğretmenlerin eğitim durumu değişkeninin, okul yöneticilerinin yenilik yönetimi davranışının algılanmasında önemli bir değişken olmadığı ifade edilebilir.

Araştırmanın dördüncü amacı öğretmenlerin örgütsel bağlılık düzeylerinin demografik değişkenlere göre incelenmesidir. Cinsiyet değişkenine göre sadece örgütsel bağlılık davranışının uyum [$t(407)=2.07, p>0.04$] boyutunda anlamlı düzeyde farklılık görülmektedir. Araştırmanın sonucuna göre kadınların uyum davranışının erkeklere göre daha fazla olduğu söylenebilir.

Alan değişkenine göre incelendiğinde, sadece uyum boyutunda [$F(3, 385)=3.88, p<0.05$] farklılık görülmektedir. Uyum boyutundaki bu fark sınıf ve meslek öğretmeni grupları arasındadır. Buna göre sınıf öğretmenlerinin uyum düzeyleri, meslek öğretmenlerinin uyum düzeyinden daha yüksektir.

Okul türü değişkenine göre incelendiğinde, yine sadece uyum [$F(2, 405)=9.47, p<0.05$] boyutunda farklılık görülmektedir. Uyum boyutunda ilkökul ile lise öğretmeni ve ortaokul ile lise öğretmeni grupları arasında anlamlı fark görülmektedir. Buna göre ilkökul ve ortaokul öğretmenlerinin uyum algı düzeyleri, lise öğretmenlerinin algı düzeyinden daha yüksektir.

Kıdem yılı değişkenine göre incelendiğinde, sadece uyum [$F(4, 403)=4.50, p<0.05$] boyutunda anlamlı farklılık görülmektedir. Uyum boyutunda 0-5 yıl arası ile 6-10 yıl arası, 0-5 yıl arası ile 21 yıl ve üzeri ve 11-15 yıl arası ile 21 yıl ve üzeri kıdeme sahip öğretmen grupları arasında anlamlı fark görülmektedir. Buna göre 0 ile 5 yıl arası kıdeme sahip öğretmenlerin örgütsel bağlılık algı düzeyi hem 6 ile 10 yıl arası hem de 21 yıl ve üzeri kıdeme sahip öğretmenlerin algı düzeyinden daha yüksektir. Ayrıca 11 ile 15 yıl arası kıdeme sahip öğretmenlerin örgütsel bağlılık algı düzeyi de 21 yıl ve üzeri kıdeme sahip öğretmenlerin algı düzeyinden daha yüksektir. Öğretmenlerin örgütsel bağlılık davranışına genel çerçevede bakıldığında yine öğretmenlerin kıdem yılına göre anlamlı fark görülmektedir. [$F(4, 403)=3.10, p<0.05$]. Bu farklılığın hangi gruplar arasında olduğunu saptamak için yapılan testin sonuçlarına göre örgütsel bağlılık davranışı için 0 ile 5 yıl arası ve 6 ile 10 yıl arası kıdeme sahip öğretmenler arasında anlamlı fark görülmektedir. Buna göre 0 ile 5 yıl arası kıdeme sahip öğretmenlerin örgütsel bağlılık algı düzeyi, 6 ile 10 yıl arası kıdeme sahip öğretmenlerin algı düzeyinden daha yüksektir.

Eğitim durumu değişkenine göre incelendiğinde, öğretmenlerin örgütsel bağlılık davranışının boyutları; uyum [$t(407)= .05, p>0.05$], özdeşleşme [$t(407)= 0.23, p>0.05$] ve içselleştirme [$t(407)= 0.88, p>0.05$] düzeylerinde öğretmenlerin eğitim durumlarına göre anlamlı bir farklılık görülmemektedir. Bu sonuçlara göre öğretmenlerin eğitim durumu değişkeninin yine öğretmenlerin örgütsel bağlılık davranışını algılanmasında önemli bir değişken olmadığı ifade edilebilir.

Bu araştırmanın beşinci amacı okul yöneticilerinin örgütsel yenilik düzeylerinin öğretmenlerin örgütsel bağlılık düzeylerini yordayıp yordamadığını belirlemektir.

Tablo 3'te, okul yöneticilerinin yenilik yönetimi davranışının boyutları girdi yönetimi, yenilik stratejileri, örgütsel kültür ve yapı ve proje yönetimine göre öğretmenlerin uyum düzeyinin yordanmasına ilişkin regresyon analizi sonuçları verilmiştir.

R= .39 R ² = .15 F ₍₄₋₄₀₈₎ = 18.42 p≤ .05							

Tablo 3. *Uyum Düzeyinin Yordanmasına İlişkin Regresyon Analizi Sonuçları*

Tablo 3'te yordayıcı değişkenlerle yordanan değişken arasındaki ikili ve kısmi korelasyonlar incelendiğinde, girdi yönetimi ile uyum arasında pozitif orta düzeyde ($r=.33$) bir ilişkinin olduğunu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.05$) olarak hesaplandığı görülmektedir. Yenilik stratejileri ile uyum arasında pozitif orta düzeyde ($r=.34$) bir ilişkinin olduğu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.00$) olarak hesaplandığı görülmektedir. Örgütsel kültür ve yapı ile uyum arasında pozitif orta düzeyde ($r=.39$) bir ilişkinin olduğu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.13$) olarak hesaplandığı görülmektedir. Proje yönetimi ile uyum arasında pozitif orta düzeyde ($r=.36$) bir ilişkinin olduğu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.02$) olarak hesaplandığı görülmektedir.

Girdi yönetimi, yenilik stratejileri, örgütsel kültür ve yapı ve proje yönetimi boyutları birlikte öğretmenlerin uyum puanları ile orta düzeyde ve anlamlı bir ilişki vermektedir ($R=.39$, $R^2=.15$, $F=18.42$, $p<.01$). Adı geçen boyutlar birlikte uyum boyutunun toplam varyansının yaklaşık % 15'ini açıklamaktadır.

Standardize edilmiş regresyon katsayısına β değerine göre yordayıcı değişkenlerin öğretmenlerin uyum boyutu üzerindeki göreceli önem sırası; örgütsel kültür ve yapı, girdi yönetimi, proje yönetimi ve yenilik stratejisidir.

Regresyon katsayılarının anlamlılığına ilişkin t testi sonuçları incelendiğinde Yenilik yönetimi boyutlarından sadece örgüt kültürü boyutu öğretmenlerin uyum boyutunun önemli bir yordayıcısı olduğu görülmektedir. Diğer boyutlar önemli bir etkiye sahip değildir. Elde edilen bulgulara göre uyum boyutunun yordanmasına ilişkin regresyon eşitliği aşağıda verilmiştir:

$$\text{Uyum} = 2.66 + (\text{Girdi Yön.} \times .07) + (\text{Yen. Str.} \times .00) + (\text{Örg. Kül.} \times .25) + (\text{Proj. Yön.} \times .04)$$

Tablo 4'te Okul yöneticilerinin yenilik yönetimi davranışının boyutları girdi yönetimi, yenilik stratejileri, örgütsel kültür ve yapı ve proje yönetimine göre öğretmenlerin özdeşleşme düzeyinin yordanmasına ilişkin regresyon analizi sonuçları verilmiştir.

Değişken	B	Standart Hata	Beta	t	p	İkili r	Kısmi r
Sabit	1.43	.17		8.27	.00

Örg. Kül.	.30	.09	.32	3.16	.00	.52	.15
Proj. Yön.	.16	.10	.16	1.62	.11	.50	.08
R= .53 R ² = .29 F ₍₄₋₄₀₈₎ = 40.70 p≤ .05							

Tablo 4. *Özdeşleşme Düzeyinin Yordanmasına İlişkin Regresyon Analizi Sonuçları*

Tablo 4'te, yordayıcı değişkenlerle yordanan değişken arasındaki ikili ve kısmi korelasyonlar incelendiğinde, girdi yönetimi ile özdeşleşme arasında pozitif orta düzeyde ($r=.45$) bir ilişkinin olduğu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.09$) olarak hesaplandığı görülmektedir. Yenilik stratejileri ile özdeşleşme arasında pozitif orta düzeyde ($r=.46$) bir ilişkinin olduğu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=-.03$) olarak hesaplandığı görülmektedir. Örgütsel kültür ve yapı ile özdeşleşme arasında pozitif orta düzeyde ($r=.52$) bir ilişkinin olduğu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.15$) olarak hesaplandığı görülmektedir. Proje yönetimi ile özdeşleşme

arasında pozitif orta düzeyde ($r=.50$) bir ilişkinin olduğu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.08$) olarak hesaplandığı görülmektedir.

Girdi yönetimi, yenilik stratejileri, örgütsel kültür ve yapı ve proje yönetimi boyutları birlikte öğretmenlerin özdeşleşme puanları ile orta düzeyde ve anlamlı bir ilişki vermektedir ($R=.53$ $R^2=.29$ $F=40.70$ $p<.01$). Adı geçen boyutlar birlikte özdeşleşme boyutunun toplam varyansının yaklaşık %29'unu açıklamaktadır.

Standardize edilmiş regresyon katsayısına β değerine göre yordayıcı değişkenlerin öğretmenlerin özdeşleşme boyutu üzerindeki göreceli önem sırası; örgütsel kültür ve yapı, proje yönetimi, girdi yönetimi ve yenilik stratejisi'dir. Regresyon katsayılarının anlamlılığına ilişkin t testi sonuçları incelendiğinde yenilik yönetimi boyutlarından sadece örgüt kültürü boyutu öğretmenlerin özdeşleşme boyutunun önemli bir yordayıcısı olduğu görülmektedir. Diğer boyutlar önemli bir etkiye sahip değildir. Elde edilen bulgulara göre özdeşleşme boyutunun yordanmasına ilişkin regresyon eşitliği aşağıda verilmiştir:

$$\text{Özdeşleşme} = 1.43 + (\text{Girdi Yön.} \times .12) + (\text{Yen. Str.} \times -.05) + (\text{Örg. Kül.} \times .32) + (\text{Proj. Yön.} \times .16)$$

Tablo 5'te okul yöneticilerinin yenilik yönetimi davranışının boyutları girdi yönetimi, yenilik stratejileri, örgütsel kültür ve yapı ve proje yönetimine göre öğretmenlerin içselleştirme düzeyinin yordanmasına ilişkin regresyon analizi sonuçları verilmiştir.

Değişken	B	Standart Hata	Beta	t	p	İkili r	Kısmi r

Tablo 5. İçselleştirme Düzeyinin Yordanmasına İlişkin Regresyon Analizi Sonuçları

Tablo 5'te, yordayıcı değişkenlerle yordanan değişken arasındaki ikili ve kısmi korelasyonlar incelendiğinde, girdi yönetimi ile içselleştirme arasında pozitif orta düzeyde ($r=.34$) bir ilişkinin olduğu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.03$) olarak hesaplandığı görülmektedir. Yenilik stratejileri ile içselleştirme arasında pozitif orta düzeyde ($r=.38$) bir ilişkinin olduğunu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.09$) olarak hesaplandığı görülmektedir. Örgütsel kültür ve yapı ile içselleştirme arasında pozitif orta düzeyde ($r=.37$) bir ilişkinin olduğunu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.04$) olarak hesaplandığı görülmektedir. Proje yönetimi ile içselleştirme arasında pozitif orta düzeyde ($r=.37$) bir ilişkinin olduğunu, ancak diğer değişkenler kontrol edildiğinde iki değişken arasındaki korelasyonun ($r=.05$) olarak hesaplandığı görülmektedir.

Girdi yönetimi, yenilik stratejileri, örgütsel kültür ve proje yönetimi boyutları birlikte öğretmenlerin içselleştirme puanları ile orta düzeyde ve anlamlı bir ilişki vermektedir ($R=.39$, $R^2=.16$, $F=18.80$, $p<.01$). Adı geçen boyutlar birlikte içselleştirme boyutunun toplam varyansının yaklaşık %16'sını açıklamaktadır.

Standardize edilmiş regresyon katsayısına β değerine göre yordayıcı değişkenlerin öğretmenlerin içselleştirme boyutu üzerindeki göreceli önem sırası; yenilik stratejisi, proje yönetimi, örgütsel kültür ve yapı ve girdi yönetimidir.

Regresyon katsayılarının anlamlılığına ilişkin t testi sonuçları incelendiğinde Yenilik yönetimi boyutlarının hiç birisi önemli bir etkiye sahip değildir. Elde edilen bulgulara göre içselleştirme boyutunun yordanmasına ilişkin regresyon eşitliği aşağıda verilmiştir:

$$\text{İçselleştirme} = 2.35 + (\text{Girdi Yön.} \times .04) + (\text{Yen. Str.} \times .15) + (\text{Örg. Kül.} \times .08) + (\text{Proj. Yön.} \times .09)$$

Tartışma ve Sonuç

Bu araştırmada ilköğretim, ortaokul ve liselerde görev yapan okul yöneticilerinin örgütsel yenilik düzeyleri ve öğretmenlerin örgütsel bağlılık düzeylerinin incelenmesi hedeflenmiştir. Araştırmaya katılan öğretmenlerin görüşlerine göre yenilik yönetimi konusunda okul yöneticileri en fazla örgütsel kültür ve yapıya önem vermekte ve kültür ve yapının korunması yönünde davranışlar sergilemektedir. Bunu sırasıyla yenilik stratejilerine, proje yönetimine ve girdi yönetimine verilen önem izlemektedir. Göl ve Bülbül'ün (2012) araştırmasında bu sıralama yenilik stratejileri, örgütsel kültür ve yapı, proje yönetimi ve girdi yönetimi şeklinde çıkmıştır. Argon, İsmetoğlu ve İşeri'nin (2014) araştırmasında ise örgütsel kültür ve yapı, proje yönetimi, yenilik stratejileri ve girdi yönetimi

şeklinde çıkmıştır. Sonuçlar bu araştırmanın sonuçlarıyla paralellik göstermektedir. Üç araştırmada da ortalamalar birbirine yakındır. Girdi yönetimine verilen önem üç araştırmada da diğerlerine göre daha düşüktür. Örgütsel kültür ve yapıya verilen önem ise tüm araştırma sonuçlarında en yüksektir. Bu durum, okul yöneticilerinin örgüt kültürü ve yapısına verdiği önemi göstermektedir. Okul yöneticileriyle ilgili çıkan bu sonuç son derece anlamlıdır, çünkü öncelikle örgüt kültürü oluşturmak ve oluşturulan yapıyı korumak yenilik yapmak için temel oluşturma olarak kabul edilebilir. Örgüt kültürü özgür düşüncenin hâkim olduğu ve yaratıcı fikirlerin desteklendiği bir yapıya sahip olursa, o örgüt içinde örgütten kaynaklı yenilik engelleri azaltılmış olur. Yenilik ve yenilikçiliğin diğer boyutlarına da böyle bir örgüt ikliminde daha fazla önem verilebilir.

Araştırmaya katılan öğretmenlerin örgütsel bağlılıkları en fazla içselleştirme davranışı şeklinde gelişmektedir. Bunu sırasıyla özdeşleşme ve uyum davranışları izlemektedir. Kılıç'ın (2011) ve Ergen'in (2015), araştırmalarında da bu sıra içselleştirme, özdeşleşme ve uyum şeklindedir. İçselleştirme davranışı diğerlerine göre daha üst düzey bir bağlılık şeklidir. En fazla içselleştirme davranışının olması ve ortalamasının bu ölçüğe göre "çok" değerinde olması öğretmenlerin örgütlerine olan bağlılığının genel olarak iyi düzeyde olduğunu göstermektedir. Uyum bağlılığı ise sıranın en sonundadır. Uyum bağlılığı diğerlerine göre daha yüzeysel bir bağlılık özelliği taşımaktadır. Öğretmenlerin örgütlerine üst düzeyde bağlanması beklenir, çünkü öğretmenlik fedakârlık gerektiren bir meslektir. Bu şekilde çıkan bağlılık örgütün iklimini olumlu yönde etkileyebilir ve öğretmenin öğrencileri için daha faydalı olmasını sağlayabilir.

Öğretmenlerin okul yöneticilerinin yenilik yönetimi hakkındaki görüşlerinde kıdem yılı değişkenine göre anlamlı fark görülmektedir, ancak cinsiyet, alan, okul türü, eğitim durumu değişkenine göre anlamlı düzeyde fark görülmemektedir.

Öğretmenlerin okul yöneticilerinin yenilik yönetimi hakkındaki görüşlerinde cinsiyet değişkenine göre anlamlı düzeyde fark görülmemiştir. Göl ve Bülbül'ün (2012), Argon, İsmetoğlu ve İşeri'nin (2014), Bülbül'ün (2012a), Karataş, Gök ve Özçetin'in (2015), araştırmalarında da okul yöneticilerinin yenilik yönetimi hakkındaki görüşlerinde cinsiyet değişkenine göre anlamlı düzeyde fark görülmemiştir. Bu yapılan araştırmalardan çıkan sonuçlar da bizim araştırmamızda çıkan sonucu destekler niteliktedir. Kadın ve erkek öğretmenlerin yöneticilerinin uyguladığı yenilik yönetimi davranışı hakkındaki görüşlerinin anlamlı düzeyde farklılaşmaması, öğretmenlerin aynı ortamlarda vakit geçirmelerinden ve buna bağlı olarak aynı durumlar karşısında benzer düşüncelere sahip olmalarından ya da düşüncelerinin birbirinden etkilenmesinden kaynaklanabilir. Kadın-erkek karma şekilde çalışılan benzer çalışma ortamlarında çalışan kişilerden alınacak sonucun da benzer olması zaten beklenen bir durumdur.

Öğretmenlerin okul yöneticilerinin yenilik yönetimi hakkındaki görüşlerinde alan değişkenine göre anlamlı düzeyde fark görülmemektedir. Göl ve Bülbül'ün (2012) araştırmasında ise yenilik yönetimi davranışının boyutu proje yönetimi davranışında öğretmenlerin alan değişkenine göre anlamlı düzeyde fark çıkmıştır. Bu fark sınıf öğretmenleri ile branş öğretmenleri arasındadır. Araştırmanın sonucuna göre sınıf öğretmenleri yöneticilerini proje yönetimi konusunda branş öğretmenlerine göre daha yeterli görmekteydiler. Göl ve Bülbül'ün (2012) araştırmasıyla bu araştırmanın sonucunun farklı çıkması 2012-2013 eğitim öğretim yılı itibarıyla 4+4+4 sisteminin uygulanmaya başlanması ve yönetici görevlendirme kriterlerinin değişmesi olabilir. 4+4+4 sistemi öncesinde ilkokullar ilköğretim sistemi içinde iken okul olarak yeni proje yapma ve projelere katılma ihtimalleri daha yüksekti ve sınıf öğretmenleri kendi öğrenci profilini göz önünde bulundurarak ortaokulla birlikte yapılan yenilik projelerini büyük projeler ve yenilikler olarak görebilmekteydi. Yeni sistemde ilkokullar ve ortaokulların ayrılmasıyla ilkokul bünyesinde yaşı küçük olan öğrenciler kaldı. Yapılan yenilikler de ilkokul bazında olduğu için yenilik yönetimi konusunda ilkokul öğretmenlerinin görüşleri de branş öğretmenlerinininkine benzer hale gelmiş olabilir.

Öğretmenlerin okul yöneticilerinin yenilik yönetimi hakkındaki görüşlerinde okul türü değişkenine göre anlamlı düzeyde fark görülmemektedir. Karataş, Gök, ve Özçetin'in (2015) öğretmen algılarına göre okul yöneticilerinin yenilik yönetimi davranışı araştırmasında ise okul türü değişkenine göre girdi yönetimi boyutunda anlamlı düzeyde fark çıkmıştır. Bu fark lise öğretmenleriyle ortaokul öğretmenleri arasındadır. Araştırmaya göre lise öğretmenlerinin okul yöneticilerinin girdi yönetimi davranışı hakkındaki algıları ortaokul öğretmenlerine göre daha yüksektir. Bu yönüyle Karataş, Gök, ve Özçetin'in (2015) araştırması bu araştırmanın sonucunu desteklememektedir.

Öğretmenlerin okul yöneticilerinin yenilik yönetimi hakkındaki görüşlerinde kıdem yılı değişkenine göre yenilik stratejileri boyutunda anlamlı fark görülmektedir. 0 ile 5 yıl arası kıdem yılına sahip öğretmenler 21 yıl ve üzeri görev süresine sahip öğretmenlere göre okul yöneticilerinin yenilik stratejileri geliştirme ve uygulama davranışını daha fazla sergilediğini düşünmektedir. Kıdem yılı arttıkça öğretmenler yenilikleri kabullenmekte

zorlanabilmektedir. Bundan dolayı da kıdem yılı fazla olan öğretmenler yapılan yenilik stratejileriyle kıdem yılı az olan genç öğretmenlere göre daha az ilgilenmektedir. Argon, İsmetoğlu ve İşeri'nin (2014), Karataş, Gök ve Özçetin'in (2015), Göl ve Bülbül'ün (2012) araştırmalarında ise öğretmenlerin kıdem yılı değişkenine göre okul yöneticilerinin yenilik yönetimi davranışı hakkındaki görüşlerinde hiçbir boyutta anlamlı düzeyde fark görülmemiştir. Araştırma sonuçları bu araştırmanın sonucunu desteklememektedir. Bunun nedeni, yine son iki üç yıl içinde öğretmen atamaları bazında yapılan değişiklikler ve eğitim sisteminde yapılan değişiklikler olabilir. Son iki yıldır öğretmen atamaları mülakat sistemiyle yapılmaktadır. Öğretmenlerin ilk beş yıllık deneyimi sözleşmeli kadroda olacaktır ve sonrasında performanslarına göre daimi kadroya geçeceklerdir. Bundan dolayı 0-5 yıl arası deneyime sahip öğretmenler bu beş yıllık süreçte kendilerini bir sınavdaymış gibi düşünerek tüm yenilikçi stratejileri takip ederken. 21 yıl ve üzeri deneyime sahip öğretmenler ise yenilikçi tutumlarla çok ilgilenmeyerek sadece eski alıştığı sisteme odaklanıyor olabilir.

Öğretmenlerin okul yöneticilerinin yenilik yönetimi hakkındaki görüşlerinde eğitim durumu değişkenine göre anlamlı düzeyde fark görülmemektedir. Öğretmenlerin eğitim durumları okul yöneticilerinin yenilik yönetimi davranışı hakkındaki görüşlerini etkilememektedir. Karataş, Gök ve Özçetin'in (2015) öğretmen algılarına göre okul yöneticilerinin yenilik yönetimi davranışı araştırmasında da hiçbir boyutta öğretmenlerin eğitim durumu değişkenine göre anlamlı düzeyde fark görülmemiştir. Bu yönüyle Karataş, Gök ve Özçetin'in (2015) araştırması da araştırmanın sonucunu desteklemektedir.

Öğretmenlerin örgütsel bağlılık algılarında cinsiyet, alan, okul türü, kıdem yılı değişkenine göre anlamlı fark görülmektedir ancak eğitim durumu değişkenine göre anlamlı düzeyde fark görülmemektedir.

Öğretmenlerin örgütsel bağlılık algılarında cinsiyet değişkenine göre uyum boyutunda anlamlı düzeyde fark görülmektedir. Örgütsel bağlılık davranışında kadınlar erkeklerle göre daha fazla uyum davranışı sergilemektedir. Kılıç'ın (2011) araştırmasında da cinsiyete göre anlamlı düzeyde fark saptanmıştır. Ancak Kılıç'ın (2011) araştırmasında fark özdeşleşme boyutundadır. Araştırmanın sonucuna göre erkeklerin özdeşleşme davranışları kadınlarınkine göre daha fazladır. Bu durum Kılıç (2011) tarafından kadınların bağlılık konusunda okula değil daha çok evine dönük olmasından kaynaklandığı şeklinde yorumlanmıştır. Ancak Yılmaz ve Özcan'ın (2017), Ergen'in (2015), Kılıçarslan'ın (2013), Gören'in (2012) ve Selvitopu ve Şahin'in (2013) araştırmalarında cinsiyet değişkenine göre örgütsel bağlılık davranışının hiçbir boyutunda anlamlı düzeyde fark çıkmamıştır.

Öğretmenlerin örgütsel bağlılık algılarında alan değişkenine göre uyum boyutunda anlamlı düzeyde fark görülmektedir. Bu fark sınıf öğretmenleri ile meslek öğretmenleri arasındadır. Örgütsel bağlılık davranışında sınıf öğretmenleri meslek öğretmenlerine göre daha fazla uyum davranışı sergilemektedir. Yılmaz ve Özcan'ın (2017) araştırmasında da alan değişkenine göre anlamlı fark çıkmıştır. Bu fark içselleştirme boyutunda ve sınıf öğretmenleriyle branş öğretmenleri arasındadır. Sınıf öğretmenlerinin içselleştirme davranışı puanı branş öğretmenlerine göre anlamlı düzeyde daha yüksektir. Bu fark farklı boyutlarda olsa da genel olarak sınıf öğretmenlerinin bağlılığının meslek öğretmenlerine göre daha yüksek olduğu söylenebilir. Kılıçarslan'ın (2013) ($p<0,005$) anlamlılık düzeyinde yaptığı araştırmada alan değişkenine göre uyum ve özdeşleşme davranışlarında anlamlı farklar görülmüştür. Bu farklar uyum boyutunda fen bilimleri alan öğretmenleriyle sınıf öğretmenleri ve meslek alan öğretmenleri arasındadır. Araştırmanın sonucuna göre fen alanı öğretmenlerinin uyum davranışı düzeyi sırasıyla meslek alan öğretmenleriyle sınıf öğretmenlerinden daha yüksektir. Özdeşleşme boyutunda ise fen bilimleri alan öğretmenleriyle sınıf öğretmenleri ve sosyal bilimler alan öğretmenleri arasında anlamlı düzeyde fark vardır. Araştırmanın sonucuna göre fen bilimleri alan öğretmenlerinin özdeşleşme düzeyleri hem sınıf öğretmenlerinin hem de sosyal bilimler alan öğretmenlerinden daha düşüktür. Ergen'in (2015) araştırmasında da öğretmenlerin alan değişkenine göre özdeşleşme boyutunda anlamlı düzeyde fark görülmüştür. Bu fark sınıf öğretmenleriyle branş öğretmenleri arasındadır. Araştırmanın sonucuna göre branş öğretmenleri sınıf öğretmenlerine göre daha fazla özdeşleşme davranışı sergilemektedir. Gören'in (2012) araştırmasında da alan değişkenine göre anlamlı fark çıkmıştır. Bu fark sınıf öğretmenleriyle sosyal bilimler alan öğretmenleri arasındadır. Ancak Kılıç'ın (2011) araştırmasında alan değişkenine göre anlamlı düzeyde fark çıkmamıştır.

Öğretmenlerin genel örgütsel bağlılık algılarında okul türü değişkenine göre anlamlı düzeyde fark görülmektedir. Bu fark ilköğretim öğretmenleriyle lise öğretmenleri arasındadır. İlköğretim öğretmenleri lise öğretmenlerine göre daha fazla bağlılık davranışı sergilemektedir. Bunu nedeni olarak ilköğretim öğretmenlerinin aynı okulda aynı sınıfın öğrencileriyle haftanın 5 günü beraber vakit geçirmesi olabilir. Lise öğretmenleri ise hafta içinde sürekli farklı sınıflarda derse girerek ve bazen görevlendirildikleri başka okullara da giderek haftayı geçirdikleri için okullarına daha az bağlılık duyabilirler, çünkü örgütsel bağlılığın oluşması için gereken faktörler içinde çalışanın örgütte geçirdiği süre önemli bir faktördür.

Öğretmenlerin örgütsel bağlılık algılarında okul türü değişkenine göre uyum boyutunda anlamlı düzeyde fark görülmektedir. Bu fark ilkököl ile lise öğretmenleri ve ortaokul ile lise öğretmenleri arasındadır. Sırasıyla ilkököl ve ortaokul öğretmenleri lise öğretmenine göre daha fazla uyum davranışı sergilemektedir. Kılıçarslan'ın (2013) ($p<0,005$) anlamlılık düzeyinde yaptığı araştırmada okul türü değişkenine göre uyum ve içselleştirme boyutlarında anlamlı fark çıkmazken, özdeşleşme boyutunda anlamlı düzeyde fark çıkmıştır. Bu fark ilkököl ve ortaokul öğretmenleri arasındadır. Bu araştırmanın sonucuna göre ilkököl öğretmenleri ortaokul öğretmenlerine göre daha fazla özdeşleşme davranışı sergilemektedir. Ergen'in (2015) araştırmasında da okul türü değişkenine göre özdeşleşme davranışında anlamlı fark çıkmıştır. Bu fark ise ilkököl ile lise öğretmenleri arasındadır. Araştırmaya göre lise öğretmenleri ilkököl öğretmenlerine göre daha fazla özdeşleşme davranışı sergilemektedir. Selvitopu ve Şahin'in (2013) araştırmasında da okul türü değişkenine göre anlamlı düzeyde fark görülmüştür. Ancak bu fark liseler bazında çıkmıştır. Araştırmanın sonucuna göre genel lise öğretmenlerinin örgütsel bağlılıkları meslek lisesi öğretmenlerinin örgütsel bağlılıklarına göre anlamlı düzeyde yüksektir.

Öğretmenlerin genel örgütsel bağlılık algılarında kıdem yılı değişkenine göre anlamlı düzeyde fark görülmektedir. Bu fark 0 ile 5 yıl arası kıdem yılına sahip öğretmenlerle 6 ile 10 yıl arası kıdem yılına sahip öğretmenler arasındadır. 0 ile 5 yıl arası kıdem yılına sahip öğretmenler, 6 ile 10 yıl arası kıdem yılına sahip öğretmenlere göre daha fazla bağlılık davranışı sergilemektedir.

Öğretmenlerin örgütsel bağlılık algılarında kıdem yılı değişkenine göre uyum boyutunda anlamlı düzeyde fark görülmektedir. Bu farklar 0 ile 5 yıl arası kıdem yılına sahip öğretmenlerle 6 ile 10 yıl arası kıdem yılına sahip öğretmenler, 0 ile 5 yıl arası kıdem yılına sahip öğretmenlerle 21 yıl ve üzeri kıdem yılına sahip öğretmenler ve 11 ile 15 yıl arası kıdem yılına sahip öğretmenlerle 21 yıl ve üzeri kıdem yılına sahip öğretmenler arasındadır. 0 ile 5 yıl arası kıdem yılına sahip öğretmenler, sırasıyla 6 ile 10 yıl arası kıdem yılına sahip öğretmenlere ve 21 yıl ve üzeri kıdem yılına sahip öğretmenlere göre daha fazla uyum davranışı sergilemektedir. 11 ile 15 yıl arası kıdem yılına sahip öğretmenler, 21 yıl ve üzeri kıdem yılına sahip öğretmenlere göre daha fazla uyum davranışı sergilemektedir. Yılmaz ve Özcan'ın (2017) araştırmasında ise özdeşleşme ve içselleştirme alt boyutlarında anlamlı düzeyde fark görülmüştür. Bu farklar 6-10 yıl arası kıdeme sahip öğretmenler ile 21 yıl ve üzeri kıdeme sahip öğretmenler arasında çıkmıştır. Araştırmanın sonucuna göre 21 yıl ve üzeri kıdeme sahip öğretmenler 6-10 yıl arası kıdeme sahip öğretmenlerden anlamlı düzeyde daha fazla özdeşleşme ve içselleştirme davranışı sergilemektedir. Yılmaz ve Özcan'ın (2017) araştırmasından çıkan veriler ile bu araştırmanın verileri karşılaştırıldığında uyum davranışının kıdem yılı düştükçe arttığı kıdem yılı çıktıkça azaldığı, özdeşleşme ve içselleştirme davranışlarının ise kıdem yılı düştükçe azaldığı kıdem yılı çıktıkça arttığı sonucu çıkarılabilir. Kılıçarslan'ın (2013) araştırmasında kıdem yılı değişkenine göre özdeşleşme ve içselleştirme boyutunda anlamlı fark çıkmazken uyum boyutunda anlamlı düzeyde fark görülmüştür. Bu fark 16 yıl ve üzeri kıdem yılına sahip öğretmenlerle 0-5 yıl arası, 6-10 yıl arası ve 10-15 yıl arası kıdeme sahip öğretmenler arasındadır. Bu araştırmada 16 yıl ve üzeri kıdeme sahip öğretmenlerin uyum davranışı düzeyi sırasıyla 10-15 yıl arası, 6-10 yıl arası, 0-5 yıl arası kıdeme sahip öğretmenlerden daha fazla çıkmıştır. Ergen'in (2015) araştırmasında örgütsel bağlılık davranışının tüm boyutlarında öğretmenlerin kıdem yılı değişkenine göre anlamlı fark görülmüştür. Bu farklar, uyum boyutunda 1-5 yıl arası kıdeme sahip öğretmenler ile 5-10 yıl arası kıdeme sahip öğretmenler arasındadır ve araştırma sonucuna göre 6-10 yıl arası kıdeme sahip öğretmenler 1-5 yıl arası kıdeme sahip öğretmenlere göre daha fazla uyum davranışı sergilemektedir. Özdeşleşme boyutunda ise 6-10 yıl arası kıdeme sahip öğretmenler ile 11-15 yıl arası ve 16 yıl ve üzeri kıdeme sahip öğretmenler arasındadır. Araştırma sonucuna göre 6-10 yıl arası kıdeme sahip öğretmenlerin özdeşleşme davranışı sırasıyla 11-15 yıl arası ve 16 yıl ve üzeri kıdeme sahip öğretmenlerden anlamlı düzeyde daha düşüktür. Bu yönüyle özdeşleşme boyutunda çıkan sonuç Yılmaz ve Özcan'ın (2017) araştırmasıyla benzerlik göstermektedir. İçselleştirme boyutunda ise fark 6-10 yıl arası kıdeme sahip öğretmenler ile 11-15 yıl arası kıdeme sahip öğretmenler arasındadır. Araştırma sonucuna göre 11-15 yıl arası kıdeme sahip öğretmenler 6-10 yıl arası kıdeme sahip öğretmenlere göre daha fazla içselleştirme davranışı sergilemektedir.

Selvitopu ve Şahin'in (2013) yaptığı örgütsel bağlılık araştırmasında da öğretmenlerin kıdem yılı değişkenine göre anlamlı fark görülmüştür. Bu fark 1-5 yıl arası kıdeme sahip öğretmenler ile 16-20 yıl arası kıdeme sahip öğretmenler, 21-25 yıl arası kıdeme sahip öğretmenler ve 26 yıl ve üzeri kıdeme sahip öğretmenler arasındadır. Araştırmanın sonucuna göre 1-5 yıl arası kıdeme sahip öğretmenlerin bağlılık düzeyleri sırasıyla 16-20 yıl arası, 21-25 yıl arası ve 26 yıl ve üzeri kıdeme sahip öğretmenlerden daha düşüktür. Selvitopu ve Şahin'in (2013) araştırmasının sonucu ile bu araştırmanın sonucu paralellik göstermemektedir. Gören'in (2012) araştırmasında da kıdem yılına göre örgütsel bağlılık davranışında anlamlı farklar vardır. Bu farklar 1-10 yıl arası kıdeme sahip öğretmenler ile 21-30 ve 31-40 yıl arası kıdeme sahip öğretmenler ve 11-20 yıl arası kıdeme sahip öğretmenler ile 21-30 ve 31-40 yıl arası kıdeme sahip öğretmenler arasında çıkmıştır.

Öğretmenlerin örgütsel bağlılık algılarında eğitim durumu değişkenine göre anlamlı düzeyde fark görülmemektedir. Ergen'in (2015), Kılıçarslan'ın (2013), Yılmaz ve Özcan'ın (2017) araştırmalarında da bu araştırmada olduğu gibi eğitim durumu değişkenine göre örgütsel bağlılık davranışının hiçbir boyutunda anlamlı düzeyde fark çıkmamıştır. Bu sonuçlara göre öğretmenlerin örgütsel bağlılığını eğitim durumlarının etkilemediği söylenebilir.

Öğretmenlerin görüşlerine göre okul yöneticilerinin yenilik yönetimi davranışı ile öğretmenlerin örgütsel bağlılıkları arasındaki ilişki incelenmiştir. Araştırma sonucunda öğretmenlerin görüşlerine göre okul yöneticilerinin örgütsel yenilik davranışının boyutları olan girdi yönetimi, yenilik stratejileri, örgütsel kültür ve yapı ve proje yönetimi boyutları ile öğretmenlerin örgütsel bağlılık davranışının uyum boyutu arasında orta düzeyde ve anlamlı bir ilişki bulunmaktadır. Yenilik yönetimi davranışının boyutları uyum davranışına ilişkin toplam varyansın %15'ini açıklamaktadır.

Buna göre öğretmenlerin örgütsel bağlılık davranışının uyum boyutunun yordanmasında okul müdürlerinin sergilemiş olduğu yenilik davranışları önemli düzeyde etkili olmaktadır. Bu bağlamda bu regresyon denklemine göre okul müdürleri ne kadar çok yenilik davranışı sergilerse öğretmenlerin örgütsel bağlılık davranışının uyum boyutu artış gösterir.

Öğretmenlerin görüşlerine göre okul yöneticilerinin örgütsel yenilik davranışının boyutları olan girdi yönetimi, yenilik stratejileri, örgütsel kültür ve yapı ve proje yönetimi boyutları ile öğretmenlerin örgütsel bağlılık davranışının özdeşleşme boyutu arasında orta düzeyde ve anlamlı bir ilişki bulunmaktadır. Yenilik yönetimi davranışının boyutları özdeşleşme davranışına ilişkin toplam varyansın %29'unu açıklamaktadır.

Buna göre öğretmenlerin örgütsel bağlılık davranışının özdeşleşme boyutunun yordanmasında okul müdürlerinin sergilemiş olduğu yenilik davranışları önemli düzeyde etkili olmaktadır. Bu bağlamda bu regresyon denklemine göre okul müdürlerinin sergileyeceği örgütsel kültür ve yapı, proje yönetimi ve girdi yönetimi boyutlarındaki yenilik davranışları öğretmenlerin örgütsel bağlılık davranışının özdeşleşme boyutunda artışa neden olurken yenilik stratejileri davranışının artışı ise özdeşleşmenin azalmasına neden olmaktadır.

Öğretmenlerin görüşlerine göre okul yöneticilerinin örgütsel yenilik davranışının boyutları olan girdi yönetimi, yenilik stratejileri, örgütsel kültür ve yapı ve proje yönetimi boyutları ile öğretmenlerin örgütsel bağlılık davranışının içselleştirme boyutu arasında orta düzeyde ve anlamlı bir ilişki bulunmaktadır. Yenilik yönetimi davranışının boyutları içselleştirme davranışına ilişkin toplam varyansın %16'sını açıklamaktadır.

Buna göre öğretmenlerin örgütsel bağlılık davranışının içselleştirme boyutunun yordanmasında okul müdürlerinin sergilemiş olduğu yenilik davranışları önemli düzeyde etkili olmaktadır. Bu bağlamda bu regresyon denklemine göre okul müdürleri ne kadar çok yenilik davranışı sergilerse öğretmenlerin örgütsel bağlılık davranışının içselleştirme boyutu artış gösterir.

Alanyazında öğretmenlerin örgütsel bağlılıkları üzerine çok sayıda araştırma ve çalışma vardır. Ancak okul yöneticilerinin örgütsel yenilik düzeyleri hakkında yapılmış az sayıda çalışma vardır. Okul yöneticilerinin örgütsel yenilik düzeyleri ile öğretmenlerin örgütsel bağlılıkları arasındaki ilişki hakkında ise hiçbir çalışmaya rastlanmamıştır. Bu çalışmanın sonuçlarına ve literatürdeki genel bilgilere göre okul yöneticilerinin yenilik yönetimi davranışı ile öğretmenlerin örgütsel bağlılıkları arasındaki ilişki değerlendirilecek olursa, yenilik yönetimi davranışının boyutlarının uyum davranışıyla orta düzeyde ilişkiye sahip olması anlamlıdır. Yenilik yönetiminin içinde sürekli bir değişim ve yenileşme vardır. Bu değişim ve yenileşme de eskiyle yeninin sürekli olarak uyumlu hale getirilmesi için çaba ve çalışmayı gerektirir. Eğitimin ana merkezinde insan faktörünün olması dolayısıyla eğitimde yapılan yenilikler de çok radikal bir yapıda olamamaktadır. Yeniliğin uyumlaştırılması sürecinde zaten sistem içinde olan öğretmenin de uyumsuzluk yaşaması normaldir. Her yenilikte olduğu gibi öğretmen de yeni düzene karşı önce uyumsuzluk yaşayacak ve sonrasında sisteme ve yeni düzene alışacaktır. Bu bağlantı takip edildiğinde bir süre sonra yapılan yeniliğin çeşidine ve büyüklüğüne göre öğretmenin uyum davranışını tahmin etmek mümkün olabilir.

Öğretmenlerin uyum boyutunda olduğu gibi özdeşleşme boyutunda da sergileyeceği davranışlar benzer olacaktır. Özdeşleşme boyutu uyum davranışına göre bir aşama ileri bir bağlılıktır. Okul yöneticilerinin örgüt içinde yapılan yeniliklerde örgütün bir parçası olan öğretmenin de görüşlerine önem vermesi ve öğretmenin de önerilerini göz önünde bulundurarak yapılacak yeniliği şekillendirmesi, öğretmenin sistemle daha çok özdeşleşmesini sağlayabilir. Öğretmen kendini daha çok örgüte bağlı hissedebilir. Yordayıcılık açısından bakıldığında, uyum ve özdeşleşme davranışını yenilik yönetiminin boyutlarından örgütsel kültür ve yapı diğerlerine göre daha fazla

yordayıcıdır. Bu durum uyum ve özdeşleşmenin daha çok tanıma ve alışmayı gerektirmesinden dolayı, alışılmış geleneksel olanla yeninin çatışmasından kaynaklı olabilir.

Okul yöneticilerinin yenilik yönetimi davranışı ile öğretmenlerin içselleştirme davranışı arasındaki ilişki de yine yöneticilerin öğretmeni yenilik sürecine ne kadar dâhil ettiğiyle ilgilidir. Yenilik sürecinde ve yapılan yenilikte öğretmenin kendinden birşeyler görmesi öğretmenin bu yeniliğe daha çok katkı sağlamasına neden olabilir. Bundan dolayı yenilik yönetiminin yenilik stratejisi ve proje yönetimi boyutlarının diğer boyutlara göre içselleştirmeyi daha fazla yordayıcı bir yapıya sahip olması anlamlıdır. Yenilik stratejisi ve proje yönetimi daha çok uygulamaya dönük boyutlardır ve öğretmeni bu uygulama sürecine dâhil etmek içselleştirme davranışının boyutunu daha da arttırabilir.

Milli Eğitim Bakanlığına bağlı okullarda çalışan yöneticilerinin yenilik yönetimi konusunda kendilerini sürekli geliştirmeleri ve güncel gelişmelerden ve konulardan geri kalmamaları için yenilik konularında hizmetiçi eğitimlere katılmaları kurumları ve örgüt içindeki durumları açısından faydalı olabilir. Okul yöneticileri öğretmenlerin örgütsel bağlılıklarını arttırmak için öğretmenleri de yeni yapılacak işlerle ilgili karar alma sürecine dâhil edebilir ve öğretmenlere özgür düşünme ortamları sağlayabilirler. Okul yöneticileri öğretmenlere de yenilik yapma sürecinde görev ve sorumluluk verip onların yeniliği benimsemesini sağlayarak öğretmenlerin örgütlerine olan bağlılıklarını arttırabilirler. Bu araştırmanın evreni Muğla ilindeki okullarda görev yapan öğretmenlerden oluşmaktadır. Farklı illerde ve kurumlarda da buna benzer araştırmalar yapılabilir.

Özet

Bu araştırmanın amacı öğretmenlerin görüşlerine göre örgütsel sapma ile okulların liderlik kapasitesi arasındaki ilişkinin belirlenmesidir. Çalışma tarama modelinde desenlenmiştir. Araştırma verileri 2017–2018 Eğitim-Öğretim yılında Muğla ilinde toplanmıştır. Çalışmanın örneklemini devlet okullarında çalışan 418 öğretmen oluşturmaktadır. Çalışmada Okullarda Örgütsel Sapma Ölçeği ve Okullarda Liderlik Kapasitesi Ölçeği kullanılmıştır. Bulgular öğretmenlerin görüşlerine göre örgütsel sapma ile okulların liderlik kapasitesi arasında negatif orta düzeyde anlamlı bir ilişki olduğunu göstermektedir. Örgütsel sapma davranışlarını azaltmak için okulların liderlik kapasitesinin geliştirilmesi önerilebilir.

Giriş

Örgütlerde, çalışanların sergilediği, zarar verme amacı taşıyan ve kasıtlı olan eylemler sapma davranışları olarak ifade edilir. Örgütsel sapma örgüt kurallarına ve beklentilerine uyumsuzluk olarak tanımlanır (Avcı, 2008, 32). Yıkma, kırıp dökme, harap etme, bozma olarak tanımlanan tahripçilik (TDK, 2017) vandalizm, saldırganlık gibi benzer isimlerle adlandırılmaktadır. Çalışanların sapma davranışı kasıtlı olarak örgüt normlarını ihlal ederek örgütün, çalışanların ya da her ikisinin sağlığını tehdit eden davranışlardır (Robinson ve Bennet, 1995, 555). Çalışanın üyesi bulunduğu örgütün değerlerine ve beklentilerine uygun olmayan davranışları sapma davranışı (uyumsuz davranış, anti-sosyal davranış, işlevsiz davranış, kötü davranış, işyeri sapma davranışı, zararlı davranış) olarak ifade edilmiştir (İyigün, 2011, 12). Sapma davranışı örgüte direkt mali zarar veren sabotaj, hırsızlık gibi davranışlar olabileceği gibi müşteri kaybı, örgütün ismine zarar verme, üretimi azaltma gibi dolaylı yoldan zarar veren davranışlarda olabilir (Gruys, 1999, 2). Son 20 yılda yapılan çalışmalar örgütsel sapma davranışlarının hem örgüt, hemde bireyler üzerinde olumsuz sonuçlar doğurduğunu göstermektedir. Literatürde yer alan deneysel ve teorik olarak çalışmaların bu kanıyı destekler nitelikte olduğu görülmektedir (Yalap, 2016, 45). Sapma davranışları ile başa çıkmak zor ve maliyetlidir (Bennet ve Robinson, 2000, 349). Örgütün bütünlüğüne zarar verir (Appelbaum, Iaconi ve Matousek, 2007, 588). Hem örgütsel hem de kişiler arası boyutta çalışanların işten ayrılma niyetleri üzerinde etkiye sahip olduğu saptanmıştır (Ayazlar ve Güzel, 2013, 17). Bu davranışların sadece finansal etkisi olmadığı, aynı zamanda sosyal ve psikolojik etkilerinin de olduğu görülmektedir (Avcı, 2008, 47; Bodankin ve Tziner, 2009, 549). Her türlü sapma davranışı tüm örgütün hedeflerine ulaşmasını olumsuz etkiler ve örgütsel bağlılığın azalmasına neden olur. Ayrıca sadece çalışanların başarısını ve verimliliğini etkilemekle kalmayıp örgütün geleceğini de tehdit eder (Demir ve Tütüncü, 2010, 73).

Bir ülkenin kalkınmasında en büyük sorumluluğa sahip olan okullarda da bu tür sapma davranışlarıyla karşılaşmaktadır. Bu davranışlar eğitimin kalitesi açısından büyük bir problem oluşturmaktadır (Köse, 2013, 3). Okulların öğrencilerine istenmeyen davranışlardan temizlenmiş bir çevre sunmakla yükümlü olması nedeniyle bu tür davranışların okullarda meydana gelmesi ayrı bir önem kazanmaktadır (Özen, Gülaçtı ve Çıkılı, 2004, 48). Aksu (2016, 594) çalışmasında öğretmenlerin algıladıkları sapma davranışlarının düşük düzeyde olduğunu ama yine de daha da azaltılması gerektiğini ifade etmiştir. Eğitim örgütlerinde meydana gelen olaylar toplumun şekillenmesinde önemlidir. Okullardaki olumsuzluklar bireyin gelişiminde ve toplumla ilişkisinde kısa vadede kendini göstermese bile uzun vadede toplumsal bozulmaya yol açabilir (Türkkaş Anasız, 2016, 32).

Bu çalışmanın ikinci değişkeni liderlik kapasitesidir. Liderlik (Bass, 1990; Yukl, 2010 ve Bennis, 1999) bireyin, tanımlanmış başarıya yada örgütsel amaçlara ulaşmak için diğer grup üyelerini etkilediği süreçtir (Güçlü, 2016, 7). Okullarda okul müdürlerinin tek başına lider olduğunu düşünmek yerine okulun tüm üyeleri arasında liderlik kapasitesi geliştirilmeye çalışılmalıdır (Lambert, 2002, 37). Liderlik kapasitesi bir kişiden öte tüm kurumun işbirliği içinde paylaşılan vizyon ve sorumluluğun olmasını gerektirir (Lambert, 1998, 5).

Liderin düşük düzeyde etik davranış göstermesisapma davranışlarını artıran etmenlerden biridir (Gils, Quaquebeke, Knippenberg, Dijke ve Cremer, 2014, 193). Çünkü çalışanların sapma davranışları kötü yönetim davranışlarından etkilenir (Lian, Ferris ve Brown, 2011, 41). Dunlop ve Lee (2004, 69-76) dedikodu, iş arkadaşlarını aşağılama gibi önemsiz davranışlardan hırsızlık, sabotaj gibi ciddi sorunlara kadar büyüyebileceği, tüm örgütün işlevini önemli derecede etkilediğini, örgütün etkililiğini azaltarak görünmeyen maliyet yarattığını ve üretimi azalttığını belirtmiştir.

Okul müdürünün liderliği okulun başarısı ile güçlü bir şekilde bağlantılıdır (Bass, 2000, 34). Etkili okul konusunda son yıllarda yapılan çalışmalar okul başarısında eğitime-öğretme, değişimi başlatma ve problem çözme gibi konuların anahtar noktası olan okul müdürünün önemli etkisini vurgulamaya devam etmektedir (Portin ve Shen, 1999, 96). Okul liderliği, öğrenme kalitesinin bir göstergesi olarak dikkate alındığında, okulların elde ettiği eğitimsel sonuçlar içerisinde önemli düzeyde rol oynamaktadır. Okul liderliğini geliştirmenin birçok faydası vardır. Bunlardan en önemlileri; öğretmenlerin güdülenmesini arttırmak, okul iklimini ve okul çevresini etkisi altına almak, öğretmen liderliğini güçlendirerek okulun liderlik kapasitesini geliştirmektir (Özçetin, 2013, 1).

Türkiye’de okullarda örgütsel sapma davranışı ile ilgili yapılan araştırmalar sınırlı sayıdadır. Okullarda yapılan araştırmalar arasında öğretmenlerin örgütsel sapma davranışı ve okul müdürlerinin liderlik tarzları ile ilgili birkaç araştırmaya rastlanmıştır. Bu araştırmalar arasında farklı okul türlerinde öğretmenlerin örgütsel sapma davranışı ve okulların liderlik kapasitesi ile ilgili araştırmalar henüz yapılmamıştır. Bu araştırmanın farkı, okul liderliğini liderlik kapasitesi olarak ele almasıdır. Ayrıca, sapma davranışları açısından, farklı okul türleri arasında bir farklılığın olup olmadığı da bu araştırmanın ortaya koyacağı bir başka önemli noktadır. Bu araştırmanın alandaki bu boşlukları doldurması düşünülmektedir.

Bu çalışmada, okulların liderlik kapasitesi ile öğretmenlerin örgütsel sapma davranışı düzeyleri arasındaki ilişkinin incelenmesi amaçlanmıştır. Bu genel amaç çerçevesinde aşağıdaki sorulara yanıt aranmıştır;

- 1- Öğretmenlerin örgütsel sapma davranış düzeyi nasıldır?
- 2- Öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyi nasıldır?
- 3- Örgütsel sapma davranış düzeyi öğretmenlerin demografik değişkenlerine göre anlamlı şekilde farklılık göstermekte midir?
- 4- Okulların liderlik kapasitesi düzeylerinin, öğretmenlerin demografik değişkenlerine göre anlamlı şekilde farklılık göstermekte midir?
- 5- Okulların liderlik kapasitesi düzeyi, öğretmenlerin örgütsel sapma davranış düzeyini anlamlı şekilde yordamakta mıdır?

Yöntem

Araştırmanın Modeli

Bu araştırma tarama modelinde desenlenmiştir. Katılımcıların görüşleri betimlenip, çeşitli değişkenlere göre karşılaştırılmış ve aradaki ilişki belirlenmeye çalışılmıştır.

Evren Ve Örneklem

Araştırmanın evrenini 2017 - 2018 eğitim öğretim yılında Muğla ili genelindeki ilk, orta ve ortaöğretim okulları oluşturmaktadır. Muğla ilinde 299 ilkök, 208 ortaokul ve 112 ortaöğretim olmak üzere 619 okul bulunmaktadır. İlkokullarda 3.136, ortaokullarda 3.587 ve ortaöğretimde 3.140 olmak üzere toplam 10.133 öğretmen görev yapmaktadır. Evren büyüklüğü göz önünde bulundurularak örneklem büyüklüğü hesaplanmıştır. Bu hesaplamada örneklem büyüklüğü 370 olarak saptanmıştır. Bu amaçla 436 katılımcıya ulaşılmış ancak toplanan veriler incelendiğinde bunların 418’i değerlendirmeye uygun olduğu görülmüştür.

Veri Toplama Araçları

Bu çalışmada kullanılan veri toplama aracı üç bölümden oluşmaktadır. Birinci bölümde katılımcıları demografik bilgileri istenmiştir. İkinci bölümde Köse ve Aksu’nun (2013) geliştirdiği “Okullarda Örgütsel Sapma” ölçeği kullanılmıştır. Bu ölçek; *bireysel boyut* (3 madde), *örgütsel boyut* (9 madde) ve *etik boyut* (8 madde) olmak üzere 3 boyuttan oluşan 20 maddelik bir ölçme aracıdır. Ölçeğin genel güvenilirliği ise .93’tür (Köse ve Aksu, 386). Yapılan bu çalışmada ölçeğin Cronbach Alpha güvenilirlik katsayısı .93 olduğu saptanmıştır. Veri toplam aracının üçüncü bölümünde Lambert (2003) tarafından geliştirilen (Leadership Capacity School Survey - LCSS) "Okullarda Liderlik Kapasitesi Ölçeği-OLKÖ" kullanılmıştır. Bu ölçek Kılınç, Büyüköztürk ve Altun tarafından Türkçeye uyarlanmıştır (Kılınç, Büyüköztürk ve Altun, 2014, 23). Ölçek, *dağıtımçı liderlik boyutu* (7 madde), *paylaşılan okul vizyonu boyutu* (9 madde), *iş birliği ve ortak sorumluluk boyutu* (6 madde) ve *algılanan öğrenci başarısı boyutu* (8 madde) olmak üzere 4 boyut ve 30 maddelik bir ölçektir. Ölçeğin Cronbach Alpha güvenilirlik katsayısı .97’dir (Kılınç ve diğerleri 2014, 37). Yapılan bu çalışmada Cronbach Alpha güvenilirlik katsayısı .97 olduğu saptanmıştır.

Verilerin Analizi

Toplanan verilerin ilk incelenmesinde verilerin normal dağılıp dağılmadığı test edilmiştir. Bu test tüm boyutlar için gerçekleştirilmiş ve bulunan Skewness ve kurtosis değerleri verilerin normal dağıldığını göstermiştir. Buna göre liderlik kapasitesi ile ilgili verilerde Skewness 0,63 ve kurtosis 0,42, örgütsel sapma ile ilgili verilerde

Skewness 0,94 ve kurtosis 0,99 olarak saptanmıştır. Tabachnick ve Fidell'e (2013)göre, bu değerlerin -1,5 ile +1.5 arasında bulunması verilerin normal dağılımını göstermektedir.

Verilerin analizinde öğretmenlerin örgütsel sapma davranışları ve okulların liderlik kapasitesi ile ilgili görüşlerinin belirlenmesinde betimsel istatistikler; katılımcıların görüşlerinin karşılaştırılması için t-testi ve ANOVA analizleri kullanılmıştır. ANOVA testinde gruplar arasındaki farklılığın hangi gruplar arasında varolduğunu saptamak için Post-Hoc testlerden yararlanılmıştır. Buna göre gruplar arasındaki varyansların eşitliği sağlandığında Tukey testi ve bu eşitlik sağlanmadığında ise Dunnett's C testi uygulanmıştır. Okulların liderlik kapasitesi ile öğretmenlerin örgütsel sapma davranış düzeyleri arasındaki ilişki ise Regresyon analizi ile belirlenmeye çalışılmıştır. Korelasyon katsayısının mutlak değer olarak, 0.70–1.00 arasında olması “yüksek”; 0.69–0.30 arasında olması “orta”; 0.29–0.01 arasında olması ise “düşük” düzeyde ilişki, 0.00 olması ise ilişkinin olmaması olarak tanımlanmıştır (Büyüköztürk, Kılıç Çakmak, Akgün, Karadeniz ve Demirel, 2016, 109).

Bulgular

Bu araştırmanın ilk amacı, öğretmenler tarafından algılanan sapma davranışlarının düzeyinin belirlenmesidir. Araştırmaya katılan öğretmenlerin algıladıkları sapma davranış düzeyleri *bireysel boyut* ($\bar{x}=1.81$, $s=.67$), *örgütsel boyut* ($\bar{x}=1.83$, $s=.66$), *etik boyut* ($\bar{x}=1.35$, $s=.41$) olduğu saptanmıştır. Örgütsel sapma ölçeğinin genel ortalaması ise ($\bar{x}=1.63$, $s=.49$) olarak saptanmıştır. Buna göre okullarda bulunan örgütsel sapma davranış düzeyinin düşük düzeyde olduğu ifade edilebilir.

Bu araştırmanın ikinci amacı, öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyinin belirlenmesidir. Araştırmaya katılan öğretmenlerin görüşlerine göre *dağıtımci liderlik boyutu* ($\bar{x}=2.88$, $s=.67$), *paylaşılan okul vizyonu boyutu* ($\bar{x}=2.90$, $s=.66$), *işbirliği ve ortak sorumluluk boyutu* ($\bar{x}=2.97$, $s=.66$) ve *algılanan öğrenci başarısı boyutu* ($\bar{x}=3.03$, $s=.63$) olduğu saptanmıştır. Liderlik Kapasitesi ölçeğinin genel ortalaması ise ($\bar{x}=2.95$, $s=.60$) olarak saptanmıştır.

Bu araştırmanın üçüncü amacı öğretmen görüşlerine göre, örgütsel sapma davranış düzeyinin öğretmenlerin demografik değişkenlerine göre incelenmesidir. Yapılan analizlerde, kadın öğretmenlerin görüşlerine göre sergilenen sapma davranışlarının ($\bar{x}=1.60$, $s=.47$) düzeyinde ve erkek öğretmenlerin görüşlerine göre sergilenen sapma davranışlarının ($\bar{x}=1.67$, $s=.52$) düzeyinde olduğu görülmüştür. Okullarda sergilenen sapma davranış düzeylerine ilişkin öğretmen görüşleri tüm ölçekte ve alt boyutlarda cinsiyete göre anlamlı bir şekilde farklılık göstermemektedir.

Branşa göre incelendiğinde, iki boyutta anlamlı farklılık saptanmıştır. Buna göre örgütsel sapma –*bireysel boyut* düzeyleri arasında öğretmenlerin branşları bakımından anlamlı bir farkın olduğu görülmektedir [$F_{(2-407)}= 4.15$, $p<.05$]. Yapılan analizlerde meslek öğretmenlerin sahip olduğu örgütsel sapma –*bireysel boyut* düzeyi sınıf öğretmenlerine göre daha yüksek olduğu saptanmıştır. Bunun yanı sıra Örgütsel sapma –*örgütsel boyut* düzeyleri arasında da öğretmenlerin branşları bakımından anlamlı bir farkın olduğu görülmektedir [$F_{(2-398)}= 3.96$, $p<.05$]. Yapılan analizlerde, sınıf öğretmenlerin sahip olduğu örgütsel sapma –*örgütsel boyut* düzeyi branş öğretmenlerine ve meslek dersi öğretmenlerine göre daha düşük olduğu saptanmıştır. Örgütsel sapma- *etik boyut*ta ve tüm ölçekte branş bakımından anlamlı bir fark saptanmamıştır [$F_{(2-402)}= 0.05$, $p>.05$].

Yaşa göre incelendiğinde, Örgütsel sapma-*bireysel boyut* [$F_{(3-403)}= 1.38$, $p>.05$] ve *etik boyut* [$F_{(3-398)}= 1.66$, $p>.05$] düzeyleri arasında öğretmenlerin yaşları bakımından anlamlı bir farkın olmadığı görülmektedir. Örgütsel sapma –*örgütsel boyut* [$F_{(3-394)}= 2.81$, $p<.05$] ve ölçek genelindeki [$F_{(3-386)}= 2.90$, $p<.05$] algı düzeyleri arasında ise öğretmenlerin yaşları bakımından anlamlı bir farkın olduğu görülmektedir. Buna göre 33-42 arası yaşa arası öğretmenlerin sahip olduğu örgütsel sapma –*örgütsel boyut* düzeyi, 43-52 arası yaş arası öğretmenlere göre daha düşük olduğu saptanmıştır. Başka bir ifadeyle 43-52 arası yaş arası öğretmenlerin sahip olduğu örgütsel sapma algı düzeyi 33-42 arası yaşa arası öğretmenlere göre anlamlı bir şekilde daha yüksektir. Bu bağlamda öğretmen görüşlerine göre okullarda genel olarak sergilenen örgütsel sapma davranışlarında yaş değişkeninin önemli bir değişken olduğu ifade edilebilir.

Kıdeme göre incelendiğinde, Örgütsel sapma-*bireysel boyut* düzeyleri [$F_{(2-401)}= 1.04$, $p>.05$], Örgütsel sapma-*örgütsel boyut* davranış düzeyleri [$F_{(2-392)}= .79$, $p>.05$], örgütsel sapma-*etik boyut* davranış düzeyleri [$F_{(2-396)}= .69$, $p>.05$] ve örgütsel sapma davranış düzeyleri [$F_{(2-384)}= 1.24$, $p>.05$] olarak belirlenmiştir. Öğretmenlerin kıdemleri bakımından anlamlı bir farkın olmadığı görülmektedir. Bu bağlamda öğretmen görüşlerine göre okullarda genel olarak sergilenen örgütsel sapma davranışlarında kıdem değişkeninin önemli bir değişken olmadığı ifade edilebilir.

Okuldaki görev yapma süresine göre incelendiğinde, Örgütsel sapma-*bireysel boyutta* [$F_{(3-393)}=1.91$, $p>.05$], Örgütsel sapma-*örgütsel boyutta* [$F_{(3-384)}=.56$, $p>.05$], Örgütsel sapma-*etik boyutta* [$F_{(3-389)}=1.75$, $p>.05$] ve tüm ölçekte [$F_{(3-376)}=1.02$, $p>.05$] olarak belirlenmiştir. Öğretmenlerin okuldaki görev yapma süresine bakımından anlamlı bir farkın olmadığı görülmektedir.

Okul türüne göre incelendiğinde, Örgütsel sapma-*etik boyut* davranış düzeyleri arasında okul türüne göre anlamlı bir farkın olmadığı görülmektedir [$F_{(3-402)}=.87$, $p>.05$]. Örgütsel sapma-*bireysel boyut* davranış düzeyleri arasında ise anlamlı bir farkın olduğu görülmektedir [$F_{(3-407)}= 3.01$, $p<.05$]. Yapılan analizlerde ilkökulda görev yapan öğretmenlerin sahip olduğu örgütsel sapma-*bireysel boyut* davranışları algı düzeyi, Anadolu lisesi ve meslek lisesinde görev yapan öğretmenlere göre daha düşük olduğu saptanmıştır. Ayrıca Meslek lisesinde görev yapan öğretmenlerinsahip olduğu örgütsel sapma-*bireysel boyut* davranışları algı düzeyi, ilkökul ve ortaokulda görev yapan öğretmenlere göre daha yüksek olduğu saptanmıştır. Örgütsel sapma-*örgütsel boyut* davranış düzeyleri arasında da anlamlı bir farkın olduğu görülmektedir [$F_{(3-398)}= 6.07$, $p<.05$]. Yapılan analizlerde Anadolu lisesinde görev yapan öğretmenlerinsahip olduğu örgütsel sapma-*örgütsel boyut* davranışları algı düzeyi, İlkokul ve Ortaokulda görev yapan öğretmenlere göre daha yüksek olduğu saptanmıştır. Ölçek genelinde ise örgütsel sapma davranış düzeyleri arasında okul türü bakımından anlamlı bir farkın olduğu görülmektedir [$F_{(3-390)}= 4.32$, $p<.05$]. Yapılan analizlerde Anadolu lisesinde görev yapan öğretmenlerinsahip olduğu örgütsel sapma davranışları algı düzeyi, İlkokul ve Ortaokulda görev yapan öğretmenlere göre daha yüksek olduğu saptanmıştır. Başka bir ifadeyle İlkokul ve Ortaokulda görev yapan öğretmenlerin sahip olduğu örgütsel sapma algı düzeyi Anadolu lisesinde görev yapan öğretmenlere göre anlamlı bir şekilde daha düşüktür. Bu bağlamda öğretmen görüşlerine göre okullarda genel olarak sergilenen örgütsel sapmadavranışlarında okul türü değişkeninin önemli bir değişken olduğu ifade edilebilir.

Okulun yerleşim yerine göre anlamlı bir farkın olmadığı görülmüştür [$t_{(392)}=.32$, $p>.05$]. İlçe merkezinde bulunan okullarda görev yapan öğretmenlerin görüşlerine göre sergilenen sapma davranışlarının ($\bar{x}=1.63$, $s=.49$) düzeyinde ve köy/mahallede bulunan okullarda görev yapan öğretmenlerin görüşlerine göre sergilenen sapma davranışlarının ($\bar{x}=1.65$, $s=.47$) düzeyinde olduğu görülmüştür. Okulun yerleşim yerine göre okullarda sergilenen sapma davranış düzeylerine ilişkin öğretmen görüşleri tüm ölçekte ve alt boyutlarda anlamlı bir şekilde farklılık göstermemektedir.

Eğitim düzeyine göre incelendiğinde iki boyutta anlamlı farklılık saptanmıştır. Örgütsel sapma-*bireysel boyutta* anlamlı bir farkın olduğu görülmüştür [$t_{(405)}=2.43$, $p<.05$]. Önlisans/Lisans düzeyinde eğitim gören öğretmenlerin görüşlerine göre sergilenen sapma davranışlarının ($\bar{x}=1.78$, $s=.64$) düzeyinde ve Yüksek Lisans düzeyinde eğitim gören öğretmenlerin görüşlerine göre sergilenen sapma davranışlarının ($\bar{x}=2.04$, $s=.83$) düzeyinde olduğu görülmüştür. Buna göre Yüksek lisans mezunu öğretmenlerin algıladıkları sapma davranış düzeyi önlisans/lisans mezunu öğretmenlerin algıladıkları sapma düzeyinden daha yüksektir. Örgütsel sapma-*etik boyutta* da öğretmenlerin eğitim düzeyine göre anlamlı bir farkın olduğu görülmüştür [$t_{(400)}=2.01$, $p<.05$]. Önlisans/Lisans düzeyinde eğitim gören öğretmenlerin görüşlerine göre sergilenen sapma davranışlarının ($\bar{x}=1.36$, $s=.41$) düzeyinde ve Yüksek Lisans düzeyinde eğitim gören öğretmenlerin görüşlerine göre sergilenen sapma davranışlarının ($\bar{x}=1.23$, $s=.36$) düzeyinde olduğu görülmüştür. Buna göre önlisans/lisans mezunu öğretmenlerin algıladıkları sapma davranış düzeyiYüksek lisans mezunu öğretmenlerin algıladıkları sapma düzeyinden daha yüksektir. Örgütsel sapma-*Örgütsel Boyutta* [$t_{(397)}=1.68$, $p>.05$] ve tüm ölçekte [$t_{(389)}=.44$, $p>.05$] öğretmenlerin eğitim düzeyine göre anlamlı bir farkın olmadığı görülmüştür. Buna göre okullarda sergilenen sapma davranış düzeylerine ilişkin öğretmen görüşleri *bireysel boyutta* ve *etik boyutta* eğitim düzeyine göre anlamlı bir şekilde farklılık gösterirken *örgütsel boyutta* ve tüm ölçekte anlamlı bir farklılık göstermemektedir.

Bu araştırmanın dördüncü amacı öğretmen görüşlerine göre okulların liderlik kapasitesi düzeylerinin demografik değişkenlerine göre incelenmesidir. Cinsiyete göre *dağıtımçı liderlik boyutunda* anlamlı bir farkın olmadığı görülmüştür [$t_{(385)}= 1.54$, $p>.05$]. *Paylaşılan okul vizyonu boyutunda* [$t_{(399)}=2.95$, $p<.05$], *işbirliği ve ortak sorumluluk boyutunda* [$t_{(406)}=2.40$, $p<.05$], *algılanan öğrenci başarısı boyutunda* [$t_{(400)}=2.52$, $p<.05$] ve ölçek genelinde [$t_{(368)}=2.27$, $p<.05$] olarak belirlenmiş ve anlamlı bir farkın olduğu saptanmıştır. Kadın öğretmenlerin algıladıkları okulların liderlik kapasitesi düzeyi erkek öğretmenlerin algıladıkları okulların liderlik kapasitesi düzeyinden daha yüksektir. Başka bir ifadeyle öğretmenlerin cinsiyet değişkeni, okulların algılanan liderlik kapasitesi üzerinde *dağıtımçı liderlik boyutu* dışındaönemli bir değişkendir.

Branşa göre incelendiğinde, liderlik kapasitesi *dağıtımçı liderlik boyutu* [$F_{(2-383)}= 2.15$, $p>.05$], *paylaşılan okul vizyonu boyutu* [$F_{(2-397)}= 1.80$, $p>.05$], *işbirliği ve ortak sorumluluk boyutu* [$F_{(2-405)}= 1.23$, $p>.05$], *algılanan öğrenci başarısı boyutu* [$F_{(2-398)}= 1.49$, $p>.05$] ve ölçek genelinde [$F_{(2-367)}= 2.30$, $p>.05$] olarak belirlenmiştir. Bu bağlamda öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında branşın önemli bir değişken olmadığı ifade edilebilir.

Yaşa göre incelendiğinde, *dağıtımçı liderlik boyutu* [$F_{(3-379)}=2.06, p>.05$], *paylaşılan okul vizyonu boyutu* [$F_{(3-394)}=.59, p>.05$], *işbirliği ve ortak sorumluluk boyutu* [$F_{(3-401)}=1.01, p>.05$], *algılanan öğrenci başarısı boyutu* [$F_{(3-395)}=.85, p>.05$] ve ölçek genelinde [$F_{(3-364)}=.97, p>.05$] olarak saptanmıştır. Bu bağlamda öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında yaşın önemli bir değişken olmadığı ifade edilebilir.

Kıdeme göre incelendiğinde, *dağıtımçı liderlik boyutu* [$F_{(2-378)}=.64, p>.05$], *paylaşılan okul vizyonu boyutu* [$F_{(2-393)}=.03, p>.05$], *işbirliği ve ortak sorumluluk boyutu* [$F_{(2-400)}=1.27, p>.05$], *algılanan öğrenci başarısı boyutu* [$F_{(2-394)}=.85, p>.05$] ve ölçek genelinde [$F_{(2-363)}=.28, p>.05$] olarak belirlenmiştir. Bu bağlamda öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında kıdem değişkeninin önemli bir değişken olmadığı ifade edilebilir.

Okuldaki görev süresine göre incelendiğinde, *dağıtımçı liderlik boyutu* [$F_{(3-371)}=.95, p>.05$], *paylaşılan okul vizyonu boyutu* [$F_{(3-386)}=.42, p>.05$], *işbirliği ve ortak sorumluluk boyutu* [$F_{(3-392)}=.92, p>.05$], *algılanan öğrenci başarısı boyutu* [$F_{(3-386)}=.97, p>.05$] ve ölçek genelinde [$F_{(3-357)}=.80, p>.05$] olarak saptanmıştır. Bu bağlamda öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında okuldaki görev süresi değişkeninin önemli bir değişken olmadığı ifade edilebilir.

Okul türüne göre incelendiğinde, bir boyutta fark saptanmıştır. Liderlik kapasitesi -*dağıtımçı liderlik boyut* düzeyleri arasında öğretmenlerin görev yaptığı okul türü bakımından anlamlı bir farkın olduğu görülmektedir [$F_{(3-383)}=3.15, p<.05$]. Yapılan analizlerde ilkokulda görev yapan öğretmenlerin sahip olduğu liderlik kapasitesi -*dağıtımçı liderlik boyut* davranışları algı düzeyi, Anadolu lisesinde görev yapan öğretmenlere göre daha yüksek olduğu saptanmıştır. Bu bağlamda öğretmen görüşlerine göre okulların liderlik kapasitesi-*dağıtımçı liderlik boyut* düzeyleri arasında okul türü değişkeninin önemli bir değişken olduğu ifade edilebilir. *Paylaşılan okul vizyonu boyutu* [$F_{(3-397)}=2.54, p>.05$], *işbirliği ve ortak sorumluluk boyutu* [$F_{(3-404)}=1.72, p>.05$], *algılanan öğrenci başarısı boyutu* [$F_{(3-398)}=2.38, p>.05$] ve ölçek genelinde [$F_{(3-366)}=.2.05, p>.05$] olarak saptanmıştır. Bu bağlamda öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında okul türü değişkeninin önemli bir değişken olmadığı ifade edilebilir.

Okulun bulunduğu yerleşim yerine göre *dağıtımçı liderlik boyutu* [$t_{(385)}=.10, p>.05$], *paylaşılan okul vizyonu boyutu* [$t_{(399)}=1.22, p>.05$] ve ölçek genelinde [$t_{(368)}=1.63, p>.05$] olarak saptanmıştır. Buna göre anlamlı bir farkın görülmediği belirlenmiştir. Diğer yandan *işbirliği ve ortak sorumluluk boyutu* [$t_{(406)}=2.20, p<.05$] ve *algılanan öğrenci başarısı boyutunda* [$t_{(400)}=2.74, p<.05$] olduğu saptanmıştır. Okulun yerleşim yerine göre anlamlı bir farkın olduğu belirlenmiştir. Köy/mahallede bulunan okullarda görev yapan öğretmenlerin algıladıkları okulların liderlik kapasitesinin düzeyi ilçe merkezinde bulunan okullarda görev yapan öğretmenlerin algıladıkları liderlik kapasitesi düzeyinden daha yüksektir.

Eğitim düzeyine göre incelendiğinde, *dağıtımçı liderlik boyutu* [$t_{(381)}=1.47, p>.05$], *paylaşılan okul vizyonu boyutu* [$t_{(395)}=.18, p>.05$], *işbirliği ve ortak sorumluluk boyutu* [$t_{(403)}=.45, p>.05$], *algılanan öğrenci başarısı boyutu* [$t_{(397)}=.85, p>.05$] ve tüm ölçekte [$t_{(365)}=.51, p>.05$] olarak belirlenmiştir. Buna göre okulların liderlik kapasitesi düzeylerine ilişkin öğretmen görüşleri tüm ölçekte ve alt boyutlarında öğretmenlerin eğitim düzeyine göre anlamlı bir şekilde farklılık göstermemektedir.

Bu araştırmanın beşinci amacı öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyinin öğretmenlerin örgütsel sapma davranış düzeyini yordayıp yordamadığını belirlemektir.

Tablo 1’de Okullardaki liderlik kapasitesinin öğretmenlerin örgütsel sapma düzeyini – *bireysel boyutunu* yordamasına ilişkin çoklu regresyon analizi sonuçlarına yer verilmiştir.

Değişken	B	Standart hata	β	t	p	İkili r	Kısmi r
Sabit	3.281	.164		20.017	.000

<i>İşbirliği veOrtakSorumluluk</i>	-.128	.105	-.121	-1.215	.225	-.40	-.06
<i>Algılanan Öğrenci Başarısı</i>	-.012	.108	-.011	-.108	.914	-.38	-.00
R=.472	R ² = .222	F ₍₄₋₃₆₁₎ =25,802	p=.000				

Tablo 1.Örgütsel sapma-bireysel boyutunu yordamasına ilişkin regresyon analizi sonuçları

Tablo 1’de, örgütsel sapma - bireysel boyutu ile liderlik kapasitesinin *dağıtımçı liderlik boyutu* arasında ($r=-.47$), *paylaşılan okul vizyonu boyutu* arasında ($r=-.40$), *işbirliği ve ortak sorumluluk boyutu* arasında ($r=-.40$) ve *algılanan öğrenci başarısı boyutu* arasında ($r=-.38$) ters yönlü ve orta düzeyde ilişkiler olduğu görülmektedir. Diğer değişkenler kontrol edildiğinde de Örgütsel sapma-bireysel boyutu ile liderlik kapasitesinin *dağıtımçı liderlik boyutu* arasında ($r=-.24$), *işbirliği ve ortak sorumluluk* ($r=-.06$) ve *algılanan öğrenci başarısı* ($r=-.00$) boyutları arasında ters yönlü ve düşük düzeyde ilişki bulunmaktadır. Ancak *paylaşılan okul vizyonu boyutu* ($r=.02$) ile pozitif yönde ve düşük düzeyde ilişki bulunmaktadır.

Liderlik kapasitesinin boyutları tümü birlikte, öğretmenlerin Örgütsel sapma-bireysel boyutu düzeyleri ile orta düzeyde ve anlamlı bir ilişki vermektedir ($R=.472$, $R^2=.222$, $p<.01$). Bu boyutların tümü birlikte Örgütsel sapma-bireysel boyutunu toplam varyansın yaklaşık % 22’sini açıklamaktadır.

Standardize edilmiş regresyon katsayısına (β) göre yordayıcı değişkenlerin öğretmenlerin Örgütsel sapma-bireysel boyutu üzerindeki göreceli önem sırası; *dağıtımçı liderlik*, *işbirliği ve ortak sorumluluk*, *paylaşılan okul vizyonu* ve *algılanan öğrenci başarısı* şeklindedir.

Regresyon katsayılarının anlamlılığına ilişkin t-testi sonuçları incelendiğinde sadece *dağıtımçı liderlik boyutunun* örgütsel sapma-bireysel boyut üzerinde önemli yordayıcı olduğu görülmektedir. Diğer boyutlar önemli bir etkiye sahip değildirler.

Elde edilen bulgulara göre Örgütsel sapma-bireysel boyutunun yordanmasına ilişkin regresyon eşitliğinin matematiksel modeli aşağıda verilmiştir:

Örgütsel Sapma-bireysel boyut = $3.281 - .418$ *dağıtımçı liderlik* + $.049$ *paylaşılan okul vizyonu* - $.128$ *işbirliği ve ortak sorumluluk* - $.012$ *algılanan öğrenci başarısı*

Tablo 2’te Okullardaki liderlik kapasitesinin öğretmenlerin örgütsel sapma düzeyini – *örgütsel boyutunu* yordanmasına ilişkin çoklu regresyon analizi sonuçlarına yer verilmiştir.

Değişken	B	Standart hata	β	t	p	İkili r	Kısmi r
Sabit	3.323	.148		22.471	.000		
<i>Dağıtımçı Liderlik</i>	-.351	.085	-.366	-4.146	.000	-.50	-.22
<i>PaylaşılanOkul Vizyonu</i>	-.034	.106	-.035	-.320	.749	-.46	-.02

	.264	353)=31.585					

Tablo 2. Örgütsel sapma-örgütsel boyutunu yordanmasına ilişkin regresyon analizi sonuçları

Tablo 2’te, Örgütsel sapma – *örgütsel boyutu* ile liderlik kapasitesinin *dağıtımçı liderlik boyutu* arasında ($r=-.50$), *paylaşılan okul vizyonu boyutu* arasında ($r=-.46$), *işbirliği ve ortak sorumluluk boyutu* arasında ($r=-.45$) ve *algılanan öğrenci başarısı boyutu* arasında ($r=-.43$) ters yönlü ve orta düzeyde ilişkiler olduğu görülmektedir.

Diğer değişkenler kontrol edildiğinde de Örgütsel sapma-örgütsel boyutu ile liderlik kapasitesinin *dağıtımçı liderlik boyutu* arasında ($r=-.22$), *paylaşılan okul vizyonu* ($r=-.02$) ve *işbirliği ve ortak sorumluluk* ($r=-.08$) boyutları arasında ters yönlü ve düşük düzeyde ilişki bulunmaktadır. Ancak *algılanan öğrenci başarısı boyutu* ($r=.01$) ile pozitif yönde ve düşük düzeyde ilişki bulunmaktadır.

Liderlik kapasitesinin boyutları tümü birlikte, öğretmenlerin Örgütsel sapma-örgütsel boyutu düzeyleri ile orta düzeyde ve anlamlı bir ilişki vermektedir ($R=.513$, $R^2=.264$, $p<.01$). Bu boyutların tümü birlikte Örgütsel sapma-örgütsel boyutunu toplam varyansın yaklaşık % 26’sını açıklamaktadır.

Standardize edilmiş regresyon katsayısına (β) göre yordayıcı değişkenlerin öğretmenlerin Örgütsel sapma-örgütsel boyutu üzerindeki göreceli önem sırası; *dağıtımçı liderlik*, *işbirliği ve ortak sorumluluk*, *paylaşılan okul vizyonu* ve *algılanan öğrenci başarısı* şeklindedir.

Regresyon katsayılarının anlamlılığına ilişkin t-testi sonuçları incelendiğinde sadece *dağıtımçı liderlik boyutunun* örgütsel sapma-örgütsel boyut üzerinde önemli yordayıcı olduğu görülmektedir. Diğer boyutlar önemli bir etkiye sahip değildirler.

Elde edilen bulgulara göre Örgütsel sapma-bireysel boyutunun yordanmasına ilişkin regresyon eşitliğinin matematiksel modeli aşağıda verilmiştir:

Örgütsel Sapma- örgütsel boyut = 3.323 -.351 *dağıtımçı liderlik* -.034 *paylaşılan okul vizyonu* -.152 *işbirliği ve ortak sorumluluk* +.015 *algılanan öğrenci başarısı*

Tablo 3'te Okullardaki liderlik kapasitesinin öğretmenlerin örgütsel sapma düzeyini – *etik boyutunu* yordamasına ilişkin çoklu regresyon analizi sonuçlarına yer verilmiştir.

Değişken	B	Standart hata	β	t	p	İkili r	Kısmi r
Sabit	1.819	.105		17.402	.000		
<i>Dağıtımçı Liderlik</i>	-.068	.060	-.113	-1.139	.255	-.22	-.06
<i>Paylaşılan Okul Vizyonu</i>	.012	.076	.020	.163	.870	-.21	.01
<i>İşbirliği ve Ortak Sorumluluk</i>	-.004	.069	-.007	-.064	.949	-.21	-.003
<i>Algılanan Öğrenci Başarısı</i>	-.098	.070	-.153	-1.389	.166	-.23	-.07
R=.238	R ² =	F _(4, 359) =5.410	p=.000				

Tablo 3. Örgütsel sapma-etik boyutunu yordamasına ilişkin regresyon analizi sonuçları

Tablo 3'te, Örgütsel sapma - *etik boyutu* ile liderlik kapasitesinin *dağıtımçı liderlik boyutu* arasında ($r=-.22$), *paylaşılan okul vizyonu boyutu* arasında ($r=-.21$), *işbirliği ve ortak sorumluluk boyutu* arasında ($r=-.21$) ve *algılanan öğrenci başarısı boyutu* arasında ($r=-.23$) ters yönlü ve düşük düzeyde ilişkiler olduğu görülmektedir. Diğer değişkenler kontrol edildiğinde de Örgütsel sapma-etik boyutu ile liderlik kapasitesinin *dağıtımçı liderlik boyutu* arasında ($r=-.06$), *işbirliği ve ortak sorumluluk* ($r=-.003$) ve *algılanan öğrenci başarısı* ($r=-.07$) boyutları arasında ters yönlü ve düşük düzeyde ilişki bulunmaktadır. Ancak *paylaşılan okul vizyonu* boyutu ($r=.01$) ile pozitif yönde ve düşük düzeyde ilişki bulunmaktadır.

Liderlik kapasitesinin boyutları tümü birlikte, öğretmenlerin Örgütsel sapma-etik boyutu düzeyleri ile düşük düzeyde ve anlamlı bir ilişki vermektedir ($R=.238$, $R^2=.057$, $p<.01$). Bu boyutların tümü birlikte Örgütsel sapma-etik boyutunu toplam varyansın yaklaşık % 1'ini açıklamaktadır.

Standardize edilmiş regresyon katsayısına (β) göre yordayıcı değişkenlerin öğretmenlerin Örgütsel sapma-etik boyutu üzerindeki göreceli önem sırası; *algılanan öğrenci başarısı*, *dağıtımçı liderlik*, *paylaşılan okul vizyonu* ve *işbirliği ve ortak sorumluluk* şeklindedir.

Regresyon katsayılarının anlamlılığına ilişkin t-testi sonuçları incelendiğinde tüm boyutların örgütsel sapma- *etik boyut* üzerinde önemli yordayıcı olmadığı görülmektedir.

Elde edilen bulgulara göre Örgütsel sapma-etik boyutunun yordanmasına ilişkin regresyon eşitliğinin matematiksel modeli aşağıda verilmiştir:

Örgütsel sapma-etik boyut= 1.819 -.068*dağıtımçı liderlik* +.012*paylaşılan okul vizyonu* -.004*işbirliği ve ortak sorumluluk*-.098*algılanan öğrenci başarısı*

Tartışma ve Sonuç

Öğretmen görüşlerine göre örgütsel sapma davranış düzeyine ait bulgular incelendiğinde;

Öğretmenlerin algıladıkları sapma davranışları, *bireysel* ve *örgütsel* alt boyutlarında “nadiren” görülürken *etik* alt boyutunda ve ölçek genelinde ise “Hiçbir zaman” düzeyinde görülmektedir. Örgütsel alt boyut $\bar{x} = 1,93$ ile en yüksek düzeye, *bireysel boyut* $\bar{x} = 1,81$, *etik* alt boyutu ise $\bar{x} = 1.35$ ile en düşük değerlendirmeye sahiptir. Başka bir ifadeyle, katılımcı öğretmenlerin *bireysel* ve *örgütsel boyutta* yer alan örgütsel sapma davranışlarıyla çok az karşılaştıkları, *etik boyutta* yer alan davranışlarla hemen hemen hiç karşılaşmadıkları söylenebilir. Bu çalışmada elde edilen bulgular, Avcı (2008, 145), Argon ve Ekinci (2016,136), İyigün (2011, 125), Köse (2013, 67) ve Aksu (2016, 593)'nın yaptığı çalışmalar ile benzerlik göstermektedir. Ancak Aksu (2016, 593)'nın çalışmasında öğretmenlerin algıladıkları sapma davranış düzeyi en az *etik* ($x = 1.55$) görülmesi benzer bir durum iken, *bireysel boyutta örgütsel boyuttan* daha çok görülmesi Apaydın ve Şirin (2016, 63) ve Akdoğan ve Fettahlıoğlu (2015,48)'nın çalışmalarındaki gibi farklılık göstermektedir.

Okullarda Örgütsel Sapma ölçeği madde ortalamalarına bakıldığında en yüksek ortalamaya sahip olan maddeler Örgütsel boyutta yer alan “Okulun olumsuzlukları hakkında başkalarıyla konuşurlar.” ($\bar{x}=2,12$, $s=1,04$) ve “Çalışma arkadaşları hakkında dedikodu yaparlar.” ($\bar{x}=2,00$, $s=1,05$) maddeleridir. En yüksek ortalamaya sahip ölçek maddelerinin bile ortalamalarının bile çok yüksek olmadığı söylenebilir. Bu bulgu, Köse (2013) tarafından yapılan çalışma aynı iki maddedir. Türktaş Anasız (2016, 52), Demir (2009,158), Chirasha ve Mahapa (2012, 419)'nın da çalışmalarında dedikodu davranışının örgütlerde en yaygın davranış olduğunu ifade etmeleri

benzerdir. Okullarda Örgütsel Sapma ölçeği madde ortalamalarına bakıldığında en düşük ortalamaya sahip olan madde *Etik boyutta* yer alan “Uyuşturucu kullanırlar.” ($\bar{x}=1,29$, $s=.58$) maddesidir. Bu bulgu, Köse (2013) tarafından yapılan çalışması ile benzerlik göstermektedir.

Öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyine ait bulgular incelendiğinde; Öğretmen görüşlerine göre OLKÖ’de en yüksek ortalamaya sahip olan maddenin “Sınıf içi uygulamaları (öğretimi ve ölçme değerlendirme) tüm öğrencilerin öğrenmesi için planlarız.” ($\bar{x}=3.16$, $s=.74$) maddesi olduğu görülmüştür. Bunun sebebi öğretmenlik mesleğini yapan herkesin ilk amacının öğrencilerin öğrenmesi olduğu söylenebilir. Öğretme süreci ve yapılan ölçme-değerlendirmede gibi tüm sınıf içi uygulamaların öncelikli ve son amacı öğrencinin öğrenmesi, öğrenme düzeyinin belirlenmesi ve geliştirilmesidir. En düşük ortalamaya sahip olan madde ise *dağıtımci liderlik boyutu* “Hepimiz birbirimize liderlik etme fırsatı yaratacak şekilde hareket ediyoruz.” ($\bar{x}=2.73$, $s=.89$) maddesidir. Doğan (2016)’ın çalışmasında da aynı maddeler en yüksek ve en düşük ortalamaya sahiptir. Öğretmen görüşlerine göre OLKÖ’de en yüksek ortalamaya sahip olan ikinci madde “İhtiyaç duyulduğunda işleri gerçekleştirmek için yeni komisyonlar oluştururuz.” ($\bar{x}=3.13$, $s=.78$) maddesi olarak görülmektedir. Bunun sebebinin zümre toplantıları, şube öğretmenler kurulu gibi oluşumların zorunlu olarak yapılması olabilir. Bu süreçler tüm öğretmenler tarafından mutlaka gerçekleştirilir ve resmi olarak tebliğ edilip işin sonucu yazılı olarak bildirilir. Ölçek genelinde en düşük ortalamaya sahip olan madde “Hepimiz birbirimize liderlik etme fırsatı yaratacak şekilde hareket ediyoruz.” ($\bar{x}=2.73$, $s=.89$) maddesidir. Ölçek genelinde en düşük ortalamaya sahip olan ikinci madde ise “Yönetimle ilgili işlerde yetkiyi paylaşıyoruz.” ($\bar{x}=2.76$, $s=.91$) maddesidir. En düşük ortalamaya sahip iki maddenin en düşük boyut ortalamasına sahip *dağıtımci liderlik boyutunda* olması liderlik denince akla ilk gelen kişinin okul müdürleri olması olabilir. Okul müdürleri yapılan iş ve işlemlerde yönetimi tek elinde bulundurarak karar vermede en yetkili kişilerdir. Öğretmenlerin görüşleri alınsa bile esas olan okul müdürünün kararıdır. Lambert (2002)’a göre liderlik kavramı genellikle bir kişi ya da bir pozisyonla eşdeğer tutulur. Oysaki yetki ve sorumluluk tüm okul olarak paylaşılmalıdır. Öğretmen liderliği okul gelişimini sürdürmeye yardımcı olur.

Katılımcıların görüşlerine göre ölçeğin alt boyutlarına ilişkin ortalamalarının sırasıyla *algılanan öğrenci başarısı boyutu* ($\bar{x}=3.03$, $s=.63$), *işbirliği ve ortak sorumluluk boyutu* ($\bar{x}=2.97$, $s=.66$), *paylaşılan okul vizyonu boyutu* ($\bar{x}=2.90$, $s=.66$), *dağıtımci liderlik boyutu* ($\bar{x}=2.88$, $s=.67$) olduğu görülmektedir. *Algılanan öğrenci başarısı boyutunun* en yüksek ortalamaya sahip olması öğretmenlik mesleğinin temel amaçlarıyla uyumaktadır. Katılımcıların dağıtımci liderliğe yönelik görüşlerinin görece olarak düşük düzeyde olmasının nedenlerinden birinin, okullarda geleneksel otokratik liderlik anlayışının hâlâ büyük oranda geçerliliğini ve güncelliğini koruyor olması olduğu söylenebilir (Kılınç, 2013, 149). Liderlik kavramına yönelik tanımlama yapması istenilen katılımcıların çoğu liderliği topluluk içerisinde kurulan otorite, yetki olarak ifade etmişlerdir (Doğan, 2016, 69). Geleneksel hiyerarşik düzene ve tek adam yaklaşımlarının aksine, liderliği paylaşmak, güven kaynaklı işbirliğinin diğerlerinin uzmanlıklarına saygı duymaya ve başarı için ortak dayanışmaya bağlıdır (Özçetin, 2013, 54). Kılınç (2013)’ın çalışmasında ölçeğin alt boyutlarına ilişkin ortalamalarının aynı sırayla ve yakın ortalamayla *algılanan öğrenci başarısı boyutu* ($\bar{x}=3.01$), *işbirliği ve ortak sorumluluk boyutu* ($\bar{x}=2.93$), *paylaşılan okul vizyonu boyutu* ($\bar{x}=2.79$), *dağıtımci liderlik boyutu* ($\bar{x}=2.72$) olduğu görülmektedir. Doğan (2016)’ın çalışmasında da ölçeğin alt boyutlarının sırasının aynı olması benzer bir bulgudur. Ölçeğin genel ortalaması ($\bar{x}=2.95$, $s=.60$) da Kılınç (2013) tarafından yapılan çalışma ortalamasıyla ($\bar{x}=2.86$) benzerlik göstermektedir.

Öğretmen görüşlerine göre okullarda örgütsel sapma davranış düzeylerine ait bulguların çeşitli değişkenlere göre değerlendirilmesine ilişkin bulgular incelendiğinde;

Elde edilen verilere göre okullarda sergilenen sapma davranış düzeylerine ilişkin öğretmen görüşleri tüm ölçekte ve alt boyutlarda cinsiyete göre anlamlı bir şekilde farklılık göstermemektedir. Ayrıca erkek öğretmenlerin algıladıkları sapma davranış düzeyi tüm ölçekte ve alt boyutlarda kadın öğretmenlerin algıladıkları sapma davranış düzeylerinden daha yüksektir olduğu saptanmıştır. Bu çalışmada elde edilen bulgular, Köse (2013, 70)’nin çalışması ile benzerlik göstermektedir. Ayrıca erkek öğretmenlerin algıladıkları sapma davranış düzeyi de tüm ölçekte ve alt boyutlarda kadın öğretmenlerin algıladıkları sapma davranış düzeylerinden daha yüksek olması bulgusu da benzerdir. İyigün (2011, 125), Balay ve Sağlam (2008, 1) ve Kalağan ve Güzeller (2010, 89) de katılımcıların cinsiyetlerine göre anlamlı bir farklılık olmadığını belirtmiştir. Doğan ve Uğurlu (2014, 498) ve Bayın ve Yeşilaydın (2014, 95)’in çalışmalarında da cinsiyete göre anlamlı bir şekilde farklılık göstermeme bulgusu örtüşmektedir. Ancak kadın katılımcıların algıladıkları sapma davranış düzeyi erkek katılımcıların algıladıkları sapma davranış düzeylerinden daha yüksek olması bulgusu farklılık göstermektedir. Sezici (2015, 14) ve Yalap (2016, 78) tarafından yapılan çalışmalarda elde edilen bulgularda erkek katılımcıların kadın katılımcılardan daha yüksek düzeyde olması bulgusu benzerdir. Ancak bu çalışmalarda örgütsel sapma cinsiyete

göre anlamlı şekilde farklılık göstermektedir. Yurt dışında yapılan çalışmalarda, Hollinger ve Clark (1982, 341) cinsiyet göre bir farklılık olmadığı bulgusu ve Anwar, Sarwar, Awan ve Arif (2011, 196)'ın erkek öğretmenlerin kadın öğretmenlere göre daha çok sapma davranışı sergilendiğinin belirtilmesi örtüşmektedir. Chirasha ve Mahapa (2012, 419) kadınların algılarının daha yüksek olduğunu belirtmesi farklılık gösterirken bunun sebebinin kadınların da dedikodu yapan grupta olduklarını belirtmişlerdir.

Örgütsel sapma –*bireysel boyut* düzeyleri arasında öğretmenlerin branşları bakımından anlamlı bir farkın olduğu görülmektedir. Meslek öğretmenlerinin sahip olduğu örgütsel sapma –*bireysel boyut* düzeyi sınıf öğretmenlerine göre daha yüksek olduğu saptanmıştır. Örgütsel sapma –*örgütsel boyut* düzeyleri arasında da öğretmenlerin branşları bakımından anlamlı bir farkın olduğu görülmektedir. Sınıf öğretmenlerinin sahip olduğu örgütsel sapma –*örgütsel boyut* düzeyi branş öğretmenlerine ve meslek dersi öğretmenlerine göre daha düşük olduğu saptanmıştır. Sınıf öğretmenlerinin algı düzeyinin daha düşük olma sebebi daha küçük yaş grubu öğrencilerle çalışmaları için öğrenciye ve okula daha bağlı olmaları söylenebilir. Örgütsel sapma-*etik boyut* ve ölçek genelinde ise öğretmenlerin branşları bakımından anlamlı bir farkın olmadığı görülmektedir. Bu bulgular, Köse (2013)'nin çalışması ile Örgütsel sapma-*etik boyut* ve ölçek genelinde öğretmenlerin branşları bakımından anlamlı bir farkın olmaması benzerlik gösterirken *bireysel boyut* ve *örgütsel boyut* düzeyleri arasında anlamlı bir farkın olması bulgusu ile çelişmektedir. Kalağan ve Güzeller (2010, 89)'in çalışmasında ise okullarda sapma olarak nitelendirilebilecek davranışlarla ilgili öğretmenlerin branşlarına göre anlamlı bir farklılığın olduğu bulgusuyla benzerdir. Balay ve Sağlam (2008, 1)'in çalışmasında anlamlı farklılığının olmadığı bulgusu ile çelişmektedir.

Örgütsel sapma-*bireysel boyut* ve *etik boyut* düzeyleri arasında öğretmenlerin yaşları bakımından anlamlı bir farkın olmadığı saptanmıştır. *Örgütsel boyut* ve ölçek genelinde ise öğretmenlerin yaşları bakımından anlamlı bir farkın olduğu görülmektedir. 33-42 arası yaşa arası öğretmenlerin algı düzeyi, 43-52 arası yaş arası öğretmenlere göre daha düşük olduğu saptanmıştır. Bayın ve Yeşilaydın (2014, 95) yaşa göre anlamlı bir şekilde farklılık göstermediğini ifade etmiştir. Ayrıca hem genel örgütsel sapma ($1,91 \pm 0,70$) hem örgüte yönelik sapma ($1,98 \pm 0,84$) hem de bireyler arası sapma ($1,84 \pm 0,69$) ortalamalarının tüm yaş grupları arasında en yüksek 40 yaş ve üzeri katılımcılara ait olması bulgusu da bu çalışmadaki farklılığın görüldüğü yaş grubuna benzerdir. Balay ve Sağlam (2008, 1), Yalap (2016, 79), Kalağan ve Güzeller (2010,90), İyigün (2011,166), Hollinger ve Clark (1982, 341)'da katılımcıların yaşına göre anlamlı bir farklılık olmadığını saptamıştır. Gruys ve Sackett (2003,36), Appelbaum ve Deguire ve Lay (2005, 45), Lau, Au ve Ho (2003,39) ise yaş arttıkça çalışanların daha az sapma davranışı gösterdiğini ifade etmişlerdir.

Elde edilen verilere göre okullarda sergilenen sapma davranış düzeylerine ilişkin öğretmen görüşleri tüm ölçekte ve alt boyutlarda kıdeme göre anlamlı bir şekilde farklılık göstermemektedir. Bu bulgu, Bayın ve Yeşilaydın (2014, 95), Doğan ve Uğurlu (2014, 499), İyigün (2011, 172) ve Köse (2013)'nin çalışması ile benzerlik göstermektedir. Ancak Kalağan ve Güzeller (2010, 90) ve Gruys ve Sackett (2003, 36)'ın çalışmaları ile çelişmektedir. Bu çalışmalarda mesleki kıdemleri az olan öğretmenlerin algılarının daha yüksek olduğu belirtilmiştir.

Elde edilen verilere göre okullarda sergilenen sapma davranış düzeylerine ilişkin öğretmen görüşleri tüm ölçekte ve alt boyutlarda okuldaki görev süresine göre anlamlı bir şekilde farklılık göstermemektedir. Bu bulgu Balay ve Sağlam (2008, 1), Yalap (2016, 79) ve İyigün (2011, 170) tarafından çalışma ile benzerlik göstermektedir. Sezici (2015,14) ise çalışmasında üretkenlik karşıtı iş davranışları boyutlarından saboteetme boyutunda, staj süresi değişkenine bağlı istatistiksel olarak anlamlı bir farklılık saptamıştır. Sabote etme boyutuna göre 60-89 gün staj yapan bireylerin ($X=1.21$), 30-59 gün staj yapan bireylere ($X=1.05$) ve 90gün üstü staj yapan bireylere ($X=1.10$) göre daha yüksek bir değere sahip olduklarını belirtmiştir.

Örgütsel sapma-*etik boyut* düzeyleri arasında okul türüne göre anlamlı bir farkın olmadığı saptanmıştır. Örgütsel sapma-*bireysel boyut* düzeyleri arasında ise okul türü bakımından anlamlı bir farkın olduğu görülmektedir. İlkokulda görev yapan öğretmenlerin algı düzeyi, Anadolu lisesi ve meslek lisesinde görev yapan öğretmenlere göre daha düşük olduğu saptanmıştır. Ayrıca Meslek lisesinde görev yapan öğretmenlerin sahip olduğu örgütsel sapma-*bireysel boyut* davranışları algı düzeyi, ilkokul ve ortaokulda görev yapan öğretmenlere göre daha yüksek olduğu saptanmıştır. Örgütsel sapma-*örgütsel boyut* düzeyleri arasında da anlamlı bir farkın olduğu görülmektedir. Anadolu lisesinde görev yapan öğretmenlerin sahip olduğu örgütsel sapma-*örgütsel boyut* davranışları algı düzeyi, İlkokul ve Ortaokulda görev yapan öğretmenlere göre daha yüksektir. Ölçek genelinde de okul türü bakımından anlamlı bir farkın olduğu görülmektedir. Anadolu lisesinde görev yapan öğretmenlerin sahip olduğu örgütsel sapma davranışları algı düzeyi, İlkokul ve Ortaokulda görev yapan öğretmenlere göre daha yüksek olduğu saptanmıştır. Bu bulgu Kalağan ve Güzeller (2010, 92)'in çalışması ile benzerlik göstermektedir. Çalışmalarında okul türlerine göre anlamlı şekilde farklılık görüldüğünü [$X^2(8)=31.64$; $p<0.01$] belirtmişlerdir. İlköğretimde görev yapan öğretmenlerinin kız meslek lisesi öğretmenlerinden daha düşük örgütsel sinizm düzeyine sahip olduğu

bulunmuştur. Diğer yandan bu bulgu Bayın ve Yeşilaydın (2014, 95)'ın çalışmasında görev yapılan birime göre anlamlı bir şekilde farklılık göstermediğini ifadesi ile çelişmektedir.

Tüm ölçekte ve alt boyutlarda okulun yerleşim yerine göre anlamlı bir şekilde farklılık görülmemektedir. Köy/mahallede bulunan okullarda görev yapan öğretmenlerin algıladıkları sapma davranış düzeyi ilçe merkezinde görev yapan öğretmenlerin algıladıkları sapma davranış düzeyinden tüm alt boyutlarda ve ölçek genelinde daha yüksektir. Köy/mahalle okullarında çalışan öğretmen sayısı daha az olduğu için birbirlerini gözlemleme ve sergilenen örgütsel sapma davranışını fark etme ihtimali yüksek olduğu için algıladıkları düzey de yüksek olabilir.

Bireysel boyuta ilişkin veriler incelendiğinde, öğretmenlerin eğitim düzeyine göre anlamlı bir farkın olduğu görülmüştür. Yüksek lisans mezunu öğretmenlerin algıladıkları sapma davranış düzeyi önlisans/lisans mezunu öğretmenlerin algıladıkları sapma düzeyinden daha yüksektir. *Etik Boyuta* ilişkin veriler incelendiğinde de, öğretmenlerin eğitim düzeyine göre anlamlı bir farkın olduğu görülmüştür. Önlisans/lisans mezunu öğretmenlerin algıladıkları sapma davranış düzeyi Yüksek lisans mezunu öğretmenlerin algıladıkları sapma düzeyinden daha yüksektir. *Örgütsel boyuta* ve ölçek geneline ilişkin veriler incelendiğinde, öğretmenlerin eğitim düzeyine göre anlamlı bir farkın olmadığı görülmüştür. Bu verilere göre okullarda sergilenen sapma davranış düzeylerine ilişkin öğretmen görüşleri *bireysel boyutta* ve *etik boyutta* eğitim düzeyine göre anlamlı bir şekilde farklılık gösterirken *örgütsel boyutta* ve tüm ölçekte anlamlı bir farklılık göstermemektedir. Bayın ve Yeşilaydın (2014, 95), İyigün (2011, 166), Yalap (2016, 81), Köse (2013)'nin çalışmalarında okullarda sergilenen sapma davranış düzeylerine ilişkin öğretmen görüşlerinin eğitim düzeyi değişkenine göre anlamlı farklılığın görülmediğini belirtmiştir. Kalağan ve Güzeller (2010, 91) ise eğitim durumları arasında yapılan tek yönlü varyans analizi sonucunda gruplar arasında istatistiksel açıdan anlamlı bir fark gözlemlendiğini belirtmiştir [$F_{(2,322)}=2.77$; $p<0,1$]. Lisansüstü mezunlarının örgütsel sinizm düzeylerinin daha yüksek olduğu hesaplanmıştır. Balay ve Sağlam (2008, 1) ise öğretmenlerin sınıf içi olumsuz davranışlara ilişkin görüşleri onların eğitim düzeylerine göre anlamlı şekilde farklılık gösterdiğini belirtmiştir. Bu bağlamda, ön lisans düzeyinde eğitim almış öğretmenlerin sınıf içi olumsuz davranışlara ilişkin görüşleri, lisansüstü eğitim almış olanlardan daha yüksek bulunmuştur.

Öğretmen görüşlerine göre okulların liderlik kapasitesi düzeylerine ait bulguların çeşitli değişkenlere göre değerlendirilmesine ilişkin bulgular incelendiğinde;

Okulların liderlik kapasitesi düzeylerine ilişkin öğretmen görüşleri *dağıtımçı liderlik boyutunda* cinsiyete göre anlamlı bir şekilde farklılık göstermemektedir. Kılınç (2013, 108)'ın çalışmasında liderlik kapasitesi-*dağıtımçı liderlik* alt boyutuna ilişkin bulgu ve Korkmaz ve Gündüz (2011,124)'ün çalışmasındaki bulgularla örtüşmektedir. *Paylaşılan okul vizyonu boyutu, işbirliği ve ortak sorumluluk boyutu, algılanan öğrenci başarısı boyutu* ve tüm ölçek genelinde ise anlamlı bir şekilde farklılık göstermektedir. Kılınç (2013, 108)'ın çalışmasında liderlik kapasitesinin alt boyutlarına ilişkin görüşlerinin cinsiyet değişkenine göre anlamlı bir fark göstermediği [$(\lambda = 1.000, F_{(4, 2230)} = .27, p > .05)$] bulgusu ile çelişmektedir. Ayrıca Doğan ve Uğurlu (2014, 498) ve Doğan (2016, 65)'ın çalışmaları ile de farklılık göstermektedir. Bu çalışmada kadın öğretmenlerin algıladıkları okulların liderlik kapasitesinin düzeyi erkek öğretmenlerin algıladıkları okulların liderlik kapasitesi düzeyinden daha yüksek olduğu saptanmıştır. Ancak Doğan (2016, 65)'ın çalışmasında erkek katılımcıların puanları ortalamasının çok az oranda kadın öğretmenlerin puanından yüksek görüldüğünü belirtmiştir.

Öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında ölçek genelinde ve tüm alt boyutlarda branşın önemli bir değişken olmadığı ifade edilebilir. Bu bulgu Korkmaz ve Gündüz (2011, 124) ve Doğan (2016) çalışmaları ile örtüşmektedir.

Öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında ölçek genelinde ve tüm alt boyutlarda yaşın önemli bir değişken olmadığı ifade edilebilir. Bu bulgu Korkmaz ve Gündüz (2011,124)'ün çalışması ile benzer sonuç göstermektedir.

Öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında ölçek genelinde ve tüm alt boyutlarda kıdemin önemli bir değişken olmadığı ifade edilebilir. Bu bulgu, Doğan (2016, 81), Doğan ve Uğurlu (2014, 499) ve Korkmaz ve Gündüz (2011,124)'ün çalışmaları ile benzerlik göstermektedir. Ancak Kılınç (2013, 154)'ın araştırma sonuçları ile farklılık göstermektedir. Çalışma öğretmenlerin liderlik kapasitesi ve alt boyutlarına ilişkin görüşlerinin kıdem değişkenine göre anlamlı şekilde farklılaştığını göstermektedir. Kıdem arttıkça, öğretmenler liderlik kapasitesinin alt boyutlarına ilişkin daha olumlu görüşlere sahip olmaktadır.

Öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyleri arasında ölçek genelinde ve tüm alt boyutlarda okuldaki çalışma süresinin önemli bir değişken olmadığı saptanmıştır. Bu bulgu Korkmaz ve Gündüz (2011, 124)'ün çalışması ile örtüşmektedir.

Okul türüne göre öğretmen görüşleri, okulların liderlik kapasitesi -*dağıtımçı liderlik boyutu* algı düzeyleri arasında anlamlı bir farklılık saptanmıştır. Anadolu lisesinde görev yapan öğretmenlerin sahip olduğu liderlik kapasitesi -*dağıtımçı liderlik boyut* algı düzeyi ilkökulda görev yapan öğretmenlere göre anlamlı bir şekilde daha düşüktür. *Paylaşılan okul vizyonu, İşbirliği ve ortak sorumluluk, algılanan öğrenci başarısı* alt boyutları ve ölçek genelinde ise okul türüne göre anlamlı bir farkın olmadığı saptanmıştır.

Okulların liderlik kapasitesi düzeylerine ilişkin öğretmen görüşleri *dağıtımçı liderlik, paylaşılan okul vizyonu* alt boyutlar arasında ve tüm ölçekte okulun bulunduğu yerleşim yerine göre anlamlı bir şekilde farklılık göstermezken *işbirliği ve ortak sorumluluk boyutu ve algılanan öğrenci başarısı boyutunda* anlamlı bir şekilde farklılık göstermektedir. Köy/mahallede görev yapan öğretmenlerin İlçe merkezinde görev yapanlardan tüm ölçek ve alt boyutta daha yüksek ortalamaya sahip olduğu görülmüştür. Erdoğan (2012) küçük okullarda okulun ortak amaç ve değerlerinin paylaşılma düzeyi büyük okullara göre daha fazla olduğunu ifade etmiştir. Okulların liderlik kapasitesi düzeylerine ilişkin öğretmen görüşleri tüm ölçekte ve alt boyutlarında öğretmenlerin eğitim düzeyine göre anlamlı bir şekilde farklılık göstermemektedir. Bu bulgu Korkmaz ve Gündüz (2011, 124)'ün çalışması ile örtüşmektedir.

Öğretmen görüşlerine göre okulların liderlik kapasitesi düzeyinin öğretmenlerin örgütsel sapma davranış düzeyini yordamasına ilişkin bulgular incelendiğinde;

Örgütsel sapma-bireysel boyutu ve örgütsel boyutu ile liderlik kapasitesinin alt boyutları ile ters yönlü ve orta düzeyde anlamlı ilişkiler olduğu görülmektedir. Etik boyut ile de ters yönlü düşük düzeyde ve anlamlı ilişkiler olduğu görülmektedir. Bu bulgu alanyazındaki çalışmalarla benzerlik göstermektedir. Aksu (2016, 594) çalışmasında bireysel sapma davranışları ile dönüşümcü liderlik ($r=-,426$) ve işlemci liderlik ($r=-,349$) arasında orta düzey negatif ilişki, laissez-faire liderlik tarzı ($r=,206$) arasında düşük düzeyde pozitif ilişki bulunduğunu ifade etmiştir. Etik sapma davranışları ile dönüşümcü liderlik ($r=-,255$) ve işlemci liderlik ($r=-,237$) arasında da düşük düzey negatif ilişki, laissez-faire liderlik tarzı ($r=,182$) arasında düşük düzeyde pozitif ilişki olduğu saptanmıştır. Doğan ve Uğurlu (2014, 499) da okul yöneticilerinin etik liderlik davranışları ile öğretmenlerin örgütsel sinizm algıları arasındaki ilişki okul yöneticilerinin “etik liderlik” davranışları ile öğretmenlerin sinizme “toplam” ilişkin algıları arasında orta düzeyde, negatif ve anlamlı bir ilişki ($r=-,404$, $p<.01$) görüldüğünü belirtmiştir. Buna göre de öğretmen algılarına göre yöneticilerin etik liderlik davranışları arttıkça öğretmenlerin sinizmin “bilişsel”, “duyuşsal”, “davranışsal” boyutlarına ve sinizme “toplam” ilişkin algılarının azaldığını ifade etmiştir. Köse (2013, 89) de çalışmasında örgütsel sapma ile stratejik liderlik arasında yüksek, negatif, anlamlı bir ilişki bulunduğunu ($r=-,43$, $p<.01$) ifade etmiştir. Örgütsel sapma düzeyi ile stratejik liderlik düzeyi arasında $-.43$ düzeyinde anlamlı bir ilişki bulunduğunu ve buna göre ortaokul müdürlerinin stratejik liderlik davranışları arttıkça okullardaki örgütsel sapma davranışlarının azaldığını belirtmiştir.

Olumsuz sapma davranışları tüm örgütlerde olduğu gibi okullarda da istenmemektedir. Elde edilen bulgulara göre sapma davranışları düşük düzeyde de olsa okullarda görülmektedir. Mümkün olduğunca bu tür davranışları tamamen ortadan kaldırmak gerekmektedir. Sapma davranışlarını etkileyen birçok etmen bulunmaktadır. Bunlardan bir tanesi de okulların liderlik kapasitesidir. Okul müdürlerinin tek elinde olan bir yönetim anlayışı günümüz şartlarında değişmekte ve gelişmekte olan okulların ihtiyaçlarını karşılayamamaktadır. Okulların liderlik kapasitesi geliştirilmeli, yetki ve sorumluluklar paylaşılmalıdır. Okulların liderlik kapasitesinin geliştirilmesine katkı sağlamak için okul müdürlerine konu ile ilgili eğitimler verilebilir. Sapma davranışını etkileyebilecek farklı değişkenlerle de kıyaslamalar yapılabilir. Bu çalışma Muğla ilindeki devlet okullarında gerçekleştirilmiştir. Yeni çalışmalar özel okullarla da kıyaslayarak ve farklı illerde de yapılabilir.

sakim@skku.edu

Abstract

In terms of design education, origami has been adopted as an effective medium for morphological explorations. In origami-inspired design, numerous translations between the physical and digital models are unavoidable for the feedback loop. However, repeating the translation is highly time-consuming so that the feedback loop tends to slow down. This study proposes a complementary form-finding process between physical and digital models in the design of origami-inspired structures by combining 3D scanning, parametric modeling, and augmented reality technology. Generating digital models through 3D scanning substitutes for digital modeling with mouse and keyboard. After going through a series of performance analysis and optimization, digital models can be compared with the physical models with the aid of an AR tool. The process facilitates physical properties of physical and digital models complementarily. It was applied to the initial design stage of the pavilion.

Introduction

Origami, the art of paper folding, is the technique of creating three-dimensional objects from two-dimensional sheets (Megahed, 2017). Based on the geometric pattern relations, it has been used to develop various engineering and design applications. This wide range of applications, from expandable medical stents to folding satellite antenna, has been named as 'Origamics' demonstrating the interdisciplinary nature including mathematics, engineering, and biology (Steward, 2007). Quite a few architects have been inspired by its stability and flexibility. Its mesh network works as a structural system, and its folding mechanism provides architecture with responsiveness beyond a conventional concept of static space.

Origami-inspired design needs a transdisciplinary approach including mathematics and physics to solve the problem of structure, function, and aesthetics. In terms of design education, origami has been adopted as an effective medium for morphological explorations. By algorithms based on mathematical or physical principles, physical origamis can be represented as digital origamis for parametric design with geometrical accuracy. Although current descriptive geometrical modeling is emerging rapidly, there is a limitation of the representation of materiality in the virtual environment. Furthermore, physics simulation leads to heavy loads of computing resources and delay of calculating time, so the real-time interaction between a designer and the design medium is disturbed. The physical model can be used complementarily because it is very beneficial for feeling and touching in exploring principles of form, morphology, and structure. Designers can take a strategy using physical models for exploring initial ideas fast and then digital models for developing them (Oxman, 2008).

Compared with traditional paper-based design, a distinguishing feature of the digital design is that it allows for a form-finding process through numerous iterations between generation and simulation. In origami-inspired design, a number of translations between the physical and digital models are unavoidable for the feedback loop. However, repeating the translation is so time-consuming that the feedback loop slows down. In addition, the continuity of design media is not maintained because there is a big difference between the actions of folding papers and digital modeling with keyboard and mouse. As a result, designers cannot test various design alternatives during the early design phase. Thus, there is the need of the form-finding process maximizing the availability of physical models while reducing its representation-redundancy.

This paper aims at investigating a form-finding process characterized by the complementarity between physical and digital models in designing origami-inspired structures. Physical computing technologies such as 3D scanning and augmented reality enable the translation between physical and digital models without the designers' intervention. Generating digital models through 3D scanning means that the action of folding papers substitutes for digital modeling. After going through a series of performance analysis and optimization, digital models can be compared with the physical models through augmented reality.

In chapter 2, the concept of design media, digital design process, and tangible user interface are explained in the context of origami-inspired design. In chapter 3, the critical tools including 3D scanning, parametric modeling, augmented reality are utilized in the design process. Each application operates its process, but the data structure should be modified to ensure the continuity of dataflow. In chapter 4, the design process was applied to the pavilion design, and the educational effectiveness was observed and discussed.

In most cases, a point cloud from 3D scanning is directly converted into a mesh for representing a physical object. The mesh is too complicated to be controlled because it is composed of the excessive amount of points. This paper proposes a series of mesh editing process including mesh reduction, data sorting, and partitioning for generating a simple parametric mesh proper to form-finding.

This research focuses on the initial design stage to test the potentials of the various origami patterns. A physical model in this research means just an origami made of a piece of paper. Although the design process does not deal with scale models with specific building components, its digital models are represented as detailed models with the support of building information modeling.

Backgrounds

2.1 Design media: Origami

Without having the actual object at hand, the designer needs a medium to develop and represent his/her formative idea (Gänshirt, 2007). Design activity is highly effected by visuospatial modeling media, so the design ability to adopt a strategy depends on them (Cross, 1990). Design media have direct and essential impacts in the way architecture is conceived, developed and communicated (Bermudez & King, 2000).

Architectural design media are categorized by various standards: verbal vs. non-verbal (visual), physical vs. digital, or two-dimensional vs. three-dimensional. However, considering the three-dimensional and model-based method of designing (Garber, 2014), physical and digital models are duumvirate of the design process virtually constructing buildings.

Physical models had been the most effective traditional design media even before a perspective appeared in Renaissance. Physical models, which are handmade, manual, and material, is useful to understand the structural system, space, and form. Digital models, which are electronic, computer-aided, or virtual, support designers with higher levels of geometrical definition and abstraction. During the design process, designers do not use only one or the other but alternate both of them. Many media iterations help designers grasp the difference between physical and digital models and therefore lead to the maximum exploitation (Bermudez & King, 2000).

In origami-inspired design, origami can be represented not only as physical and but also as digital models. Physical origamis actively enhance hand-eye coordination, which in turn positively influences and develops a better sense of spatial perception (Megahed, 2017). In the earliest form of architectural education, Joseph Albers in Bauhaus used paper folding to help his students discover the relationships between materiality, geometry, and structure.

Recently due to the advance in parametric design and digital fabrication technologies, students can make use of interactive digital tools to solve various architectural design issues from structure to detail. Digital origamis are controlled by parameters and unfolded into planar figures for laser-cutting.

2.2 Digital design process

Advances in BIM (Building Information Modeling) transform the digital design process from the traditional paper-based design process. The role of digital models, which was limited to representation, now extends to generation and virtualization. The origami-inspired design also needs to adopt the concept of the digital design process from an educational standpoint. It means that it is vital to develop the curriculum and design media for students to understand the digital design process.

BIM supports performance-oriented design which building performance is a guiding design principle. From the early design stage, the multiple different performances are considered simultaneously by close collaboration among the stakeholders (Kolarevic, & Malkawi, 2005). When simulation and optimization are combined, form-finding is possible for the optimal alternative. The performance-oriented design helps designers overcome the limitation of traditional architectural design and delivery process: linear procedure and minimized time for design (Garber, 2014). Now architectural students require the capabilities to integrate various building performances through operating simulation programs or collaborating with experts.

2.3 Tangible User Interface

Most of CAAD (Computer Aided Architectural Design) programs rely on GUI (Graphic User Interface) which is a standard paradigm of HCI (Human-Computer Interaction) with a mouse-driven cursor and multiple windows. The “See, point, and click” interaction of GUI replaced for the “Remember and type” interaction of CUI (Command User Interface). Advanced modeling techniques such as polygon modeling and NURBS (Non-Uniform Rational B-Spline) extended the possibility of GUI as design media.

However, hand-eye coordination is tacit knowledge which is not easy to learn. Designers embody the operating principles inherent in individual modeling techniques and reorganize the body sensations through trials and errors (Park, 2009). Considering educational practices, it is hard to teach the theoretical backgrounds for digital design and techniques operating a certain software for a limited time. Furthermore, in designing origami-inspired structures, especially, the hand-eye coordination of GUI and folding papers are very different.

TUI (Tangible User Interface) has been researched to bridge the gap between physical and digital worlds. To

facilitate human haptic perceptions, physical objects or hand motions are used for substitutes of keyboards and mouse which are input devices of GUI. To enhance spatial cognition, AR (Augmented reality) mixes reality with virtual reality instead of just projecting on flat monitors. Since John Frazer's Universal Constructor in the early 1990s, TUI researchers have invented various tabletop applications for architecture, landscape, and urban planning.

The educational impact of TUIs as design media also has been investigated. Compared with GUI, TUI activates their spatial reasoning and collaboration far more because it reduces designers' cognitive load through seamless interactions between human and computer (Kim & Maher, 2008). However, no specific research has been undertaken on TUIs for origami-inspired design.

Methodology

The methodology works as a kind of design interface that allows designers to input physical origamis and obtain BIM with optimized shapes. It consists of a combination of 3D scanning, parametric modeling, and augmented reality as shown in [Figure 1]. To ensure the continuity of the data flow, it needs to be processed into the data format required by each process. The data formats used in this process are as follows: 1) 3D scanning: from point cloud to mesh 2) Parametric modeling: from complex mesh to simple parametric mesh and BIM 3) AR: mesh or BIM.

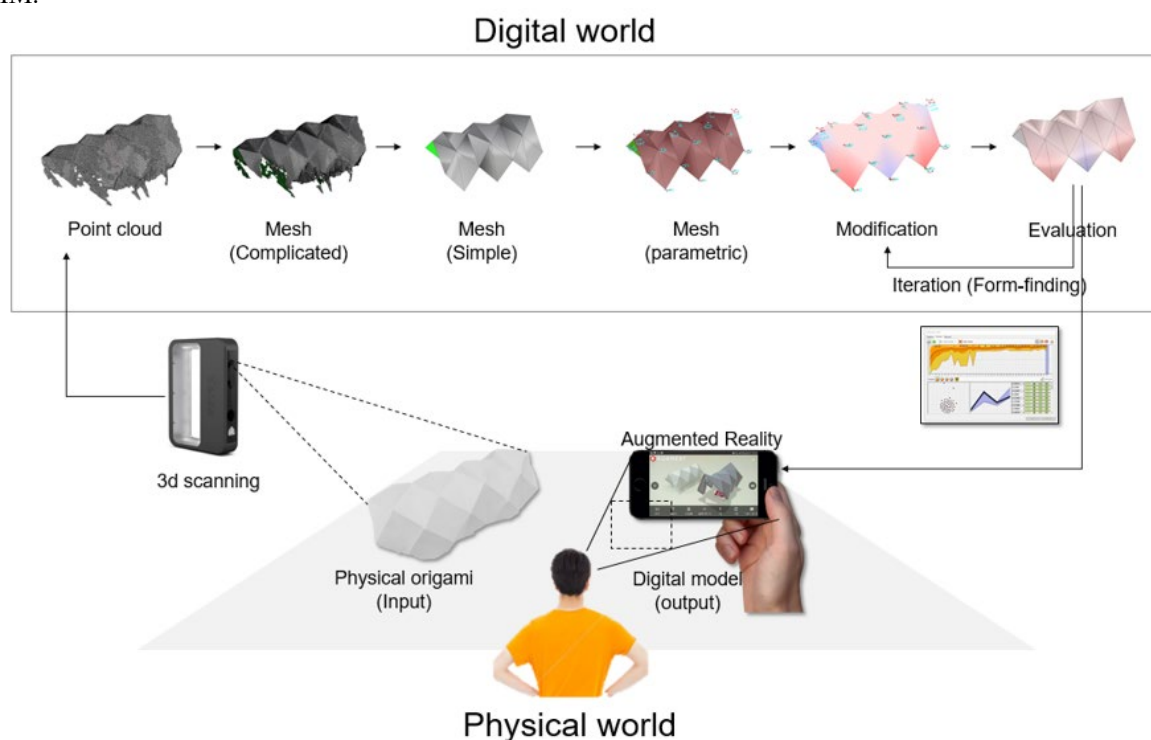

Figure 1: A dataflow diagram between physical and digital model

3.1 3D scanning: From physical to digital

The form of a physical origami, an initial input of the process, is digitized using a non-contact active scanner considering its weakness. It emits radiation or light, detects the reflection and generates a point cloud in virtual space. The form cannot be probed at once by one 3D scanner with a cone-like field of view, so multiple point clouds from different viewpoints are integrated.

3.2 Parametric modeling

A polygon mesh is generated from point clouds through Delaunay triangulation which is a mathematical way of joining a set of points to make a triangular mesh. It is scaled up to a real structure, and the unnecessary mesh faces are removed by manual selection. It is accurate to the form of the physical origami geometrically but has far more mesh faces than those of the physical origami. It needs to be simplified and parameterized to get simple parametric mesh proper to form-finding as shown in [Figure 2].

(1) Mesh simplification

Mesh reduction algorithm is used to simplify the complex mesh while preserving its overall shape. The mesh faces are reduced until the digital origami has the same number of mesh faces with the physical origami. However, this technique is applicable only to the origami which consists of triangle meshes.

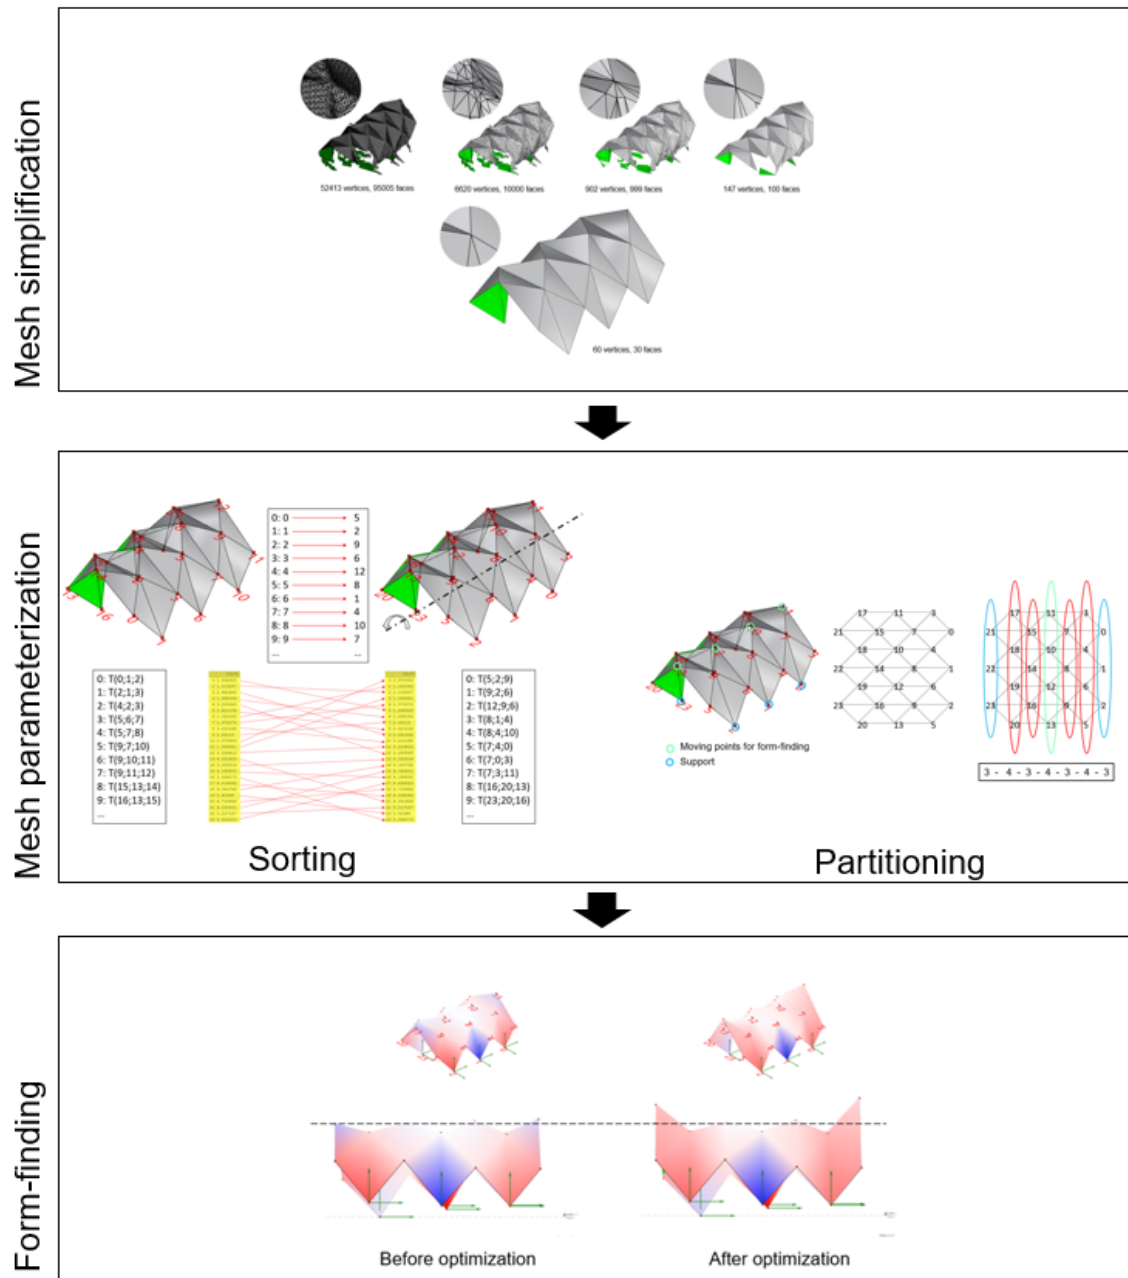

Figure 2: Parametric modeling process: Mesh simplification, parameterization, and form-finding

(2) Mesh parameterization

A polygon mesh is transformed by editing its mesh points. However, the data order of the mesh points is determined during the previous steps including 3D scanning and mesh simplification. For utilizing the mesh as a parametric model which is transformed by parameters, the data order of the mesh points should be rearranged and grouped regarding its structural system.

Using Stable sorting algorithm which maintains the relative order of records with equal keys (i.e., values), the data order is rearranged according to the numerical order of the location of mesh points. Each mesh needs its ranking way of the numerical order according to its topology. Every mesh face consists of a set of three vertices connected to others and represented like $T \{1, 7, 4\}$. They should be updated by reflecting the new data order of sorted points to maintain the same form of the mesh.

To classify the mesh points individually by their structural roles, the number of points corresponding to the origami pattern is input and used to partition the list into sub-lists. Some mesh points touching the ground serve as supports and others are selected as movable points for form-finding.

(3) Form-finding

Designers can find the optimal form from the numerous alternatives generated by changing the position of the mesh points or the properties of mesh faces. When mesh points, edges, and faces are replaced by specific building

components such as columns, beams, and windows, more detailed and various performances are analyzed as well as structural analysis.

3.3 Augmented reality: From digital to physical

Using AR application of a smartphone, the physical origami as an initial input is compared with the digital origami which offers more capabilities and realistic appearances in the same space. A designer moves and rotates the digital origami through moving tracking marker or touching screens.

Experiment

The methodology proposed in the previous chapter was applied to the initial design stage of the pavilion. The origamis used in the experiment were limited to triangle meshes and made of A4 paper. Three cases were used in the experiments as shown in [Figure 3].

Figure 3: Three design cases used in the experiments

In the course of parameterizing the meshes, all three cases needed the different coordinate systems for sorting and grouping pattern regarding the structural systems. In case of A, the coordinates were reoriented to the polar coordinate system and (3-4-3-4-3-4-3) grouping pattern. In Case of B, the z coordinates of the mesh points were used and (4-4-1) grouping pattern. In Case of C, the z coordinates of the mesh points were used and (4-4-4-1) grouping pattern.

A key performance for form-finding was its structural stability. The purpose of the optimization was to minimize the displacement caused by the gravity, and the method was GA (Genetic Algorithm). The hardware devices and software programs used in each step are as shown in [Figure 4].

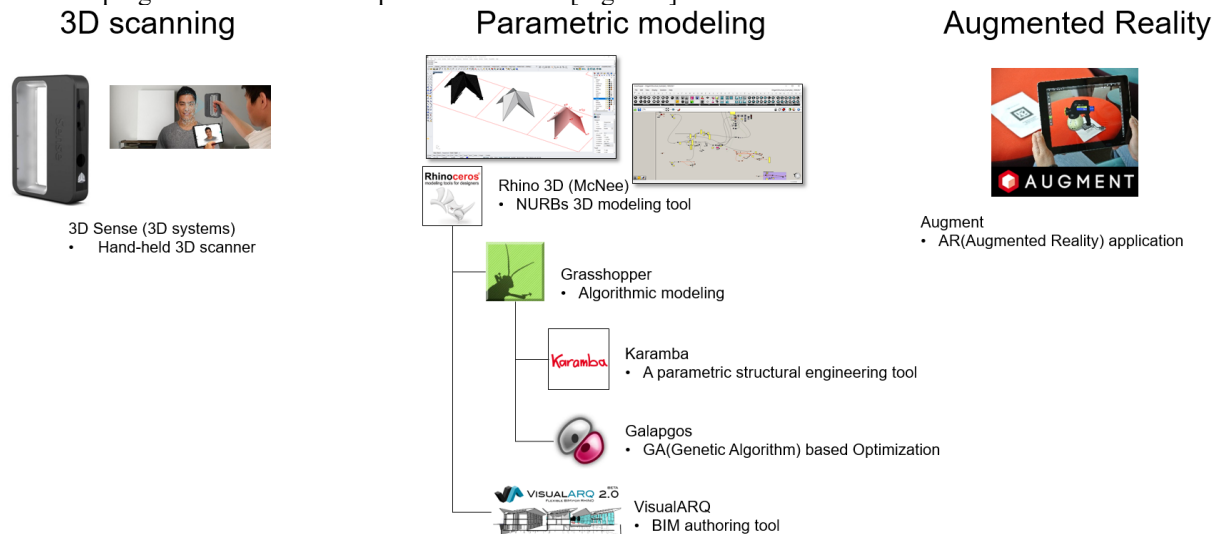

Figure 4: Hardware devices and software programs used in the experiments

Results

All the cases were structurally optimized and developed into the detailed building information models as shown in [Figure 5]. For form-finding, designers selected the moving points and their ranges considering their design intention and requirements. The maximum displacements of all the cases were reduced, but the reduced amounts varied from case to case.

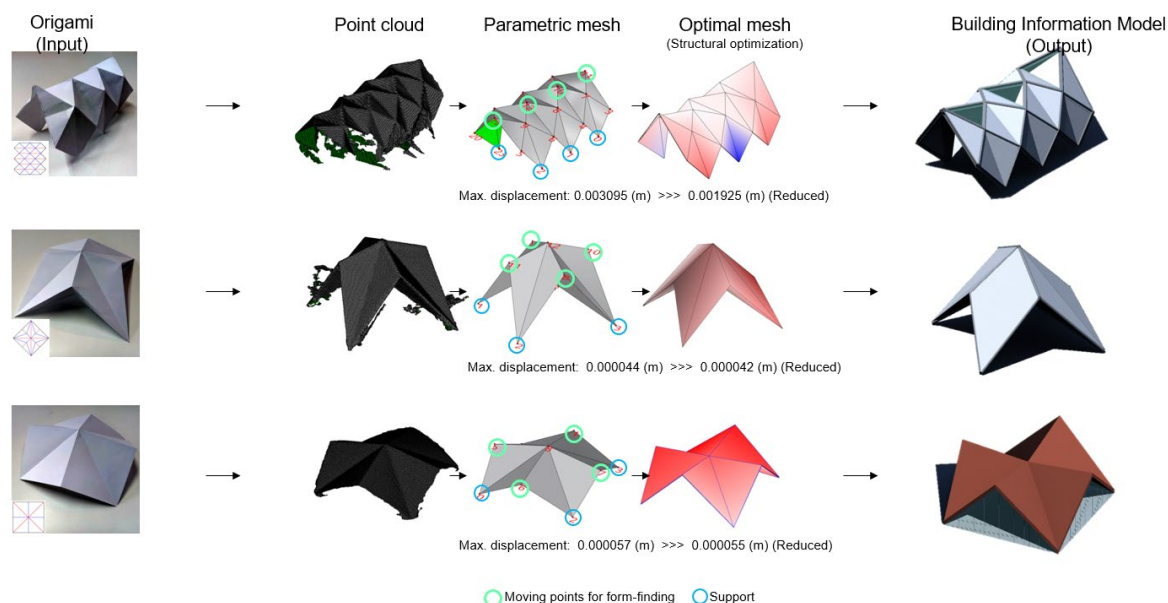

Figure 5: The results of the experiments

Findings

A physical origami is not strong enough to show its structural stability. However, it provides the topology of the structure which digital model can utilize for form-finding with virtual materiality. It is difficult to specify the direction and scope of optimization using only digital models without physical models. Physical origamis help designers understand the structural system of an origami and select points to optimize. In other words, a physical origami provides the topology of a structure, and a digital model can examine the structural possibilities on a building scale by reflecting virtual materiality.

Conclusion

This study proposes a complementary form-finding process between physical and digital models in the design of origami structures by combining 3D scanning, parametric modeling, and AR technology. The process facilitates physical properties of physical and digital models complementarily. Without designers' intervention, physical origamis were translated into digital origamis, optimized structurally and represented as specific building information models.

This paper has some limitations and necessitates future works. First, in terms of parametric modeling, the process needs to adopt the algorithm simplifying other polygon meshes. Second, in terms of performance-oriented design, the multi-criteria optimization including some environmental issues is the next step of this research. Third, in an educational sense, the methodology with real-time interactions is needed to research which designers learn tacit knowledge about the structural system.

12 Eylül 1980 Askeri Darbe Döneminde Cumhuriyet, Hürriyet Ve Tercüman Gazetelerindeki Sansür / Oto-Sansür Uygulamaları

Hureyye Özdemir
hureyya@metu.edu.tr

Özet

Araştırmada, 12 Eylül 1980 - 6 Kasım 1983 arası istisna rejimi döneminde, iktidar ve medya arasındaki ilişki incelenirken, sansür uygulamalarıyla basındaki eğilimler ele alınarak, basın çalışanlarının 12 Eylül darbesini farklı yöntemlerle nasıl meşrulaştırdığı üzerinde durulmaktadır. Araştırma için dönemin üç gazetesi seçilmiştir. Bu gazetelerde çalışan ve özellikle o döneme tanıklık eden yazarlarla yapılan söyleşilerin karşılaştırmalı analizi ve seçilen iki “Örnek olayın” medyada konumlanmaları ile sansür ve oto-sansür durumu saptanmaktadır. Basın, askeri rejimin ideolojisine yakın tutum içinde darbe öncesi, demokratik yönetimin teminatı olan parlamento ve bağımsız bir hukuk düzeni içinde bürokrasinin işletilmesinden sorumlu politikacıları olumsuz göstererek, 12 Eylül darbesi gerekçelendirilmiştir. 12 Eylül yöneticileri, sıkıyönetim düzeni içinde, güçlerinin meşrulaştırmasını sağlayarak, Türkiye’deki “hukuk” sistemini tamamen ortadan kaldırmış, yerine kendi “istisna yasasını” kurmuşlardır. Komutanların, toplumsal yaşamda demokratik tartışmayı kısıtlayarak istisna hali içinde geliştirdikleri sansür uygulamalarının günümüze dek sürdüğünü gözlemlemek mümkündür.

Online Assignments In Mathematics Courses At University

Natalia KOUZNIAC

Department of Mathematics Simon Fraser University Canada
kouzniak@sfu.ca

Abstract

Teaching mathematics courses has undergone substantial changes in the past decade. From blackboard and piece of chalk to use of I-clickers and online learning management systems, modern technology has made its way in teaching undergraduate mathematics courses. Subsequently, online assignments (OA) have become an integral part of the teaching process. Many researchers have studied pros and cons of OA if compared with standard handwritten assignments. In addition, administrators, faculty, and students have noted that both types have distinctive positive characteristics but the advantage is still not clear when used in mathematics intensive courses. In this study, the overview of advantages and disadvantages of OA based on the literature review and recent developments in the use of OA in the Department of Mathematics at SFU (Department) are presented along with a personal experience in teaching various undergraduate mathematics courses with online assignments utilizing the online resources from leading publishers.

The Study

In the past five years, the author has used OA based on the following online platforms: LonCapa (Michigan State University), WileyPlus (Wiley), WebAssign (Cengage), and MathXL (Pearson) when teaching various Calculus II and I courses as well as the Introductory Course on Ordinary Differential Equations.

A detailed literature review with analysis of pros and cons of OA can be found in Penner, Kreuze, Langsam, and Kreuze (2016), Junjic, Kent, and Menz (2012), and Malevich (2011).

Based on the author's personal experience and incorporating some of the findings from above literature review it appears that pros and cons of OA can be briefly summarized as follows.

Advantages of OA:

- OA save university funds if compared with marking handwritten assignments;

In the Fall semester each academic year about 3500 students are taking first and second year service mathematics courses taught in the Department. The cost of marking 10 assignments per student per semester (only limited number of problems are being marked!) can be estimated as exceeding \$20,000. While pedagogically sound, handwritten assignments are costly.

- All problems in OA are marked versus only 2 selected problems currently being marked in hand-written assignments for service courses in the Department;

Students get often frustrated as they spend many hours solving 15-20 assigned problems and putting down their reasonably well presented solutions on numerous pages while only two problems are typically being marked. Some credit is still given for completing the assignments (about 20% of the overall mark) though. OA allow marking all assigned problems what leads to a positive student feedback.

- OA questions are randomized;

"Pirate copies" of major textbook solution manuals are readily available on internet. Introducing OA may eliminate cheating as the coefficients in the equations vary and depending on available randomization (differs for various platforms) only limited number of students may get the identical values if any.

- All major publishers are moving towards online textbooks and accompanying OA;

Depending on the publisher, the cost of OA may be included in the package with online textbook (Wiley and Cengage), if not – the cost for a standalone OA can be negotiated between the institution and the publisher (Pearson). In addition, financial assistance is available from the publishers for low-income students, as we have discussed with them.

- OA are appealing to the students to make mathematics "less boring";

Many courses in other disciplines at SFU are now computer-based. On average, majority of students in mathematics service courses are not particularly interested in mathematics and find it boring. OA facilitate the use of technology and appeal to the students.

- Provide the instructor with quick analysis which concepts/techniques were or were not learned well by the class; Quick detailed feedback on class performance is extremely helpful in teaching large service classes (150-500 students). It allows the instructor address problematic parts of class material before it interferes with subsequent learning and major tests.
- Provide good drill practice to the students with immediate feedback; OA allow for instantaneous assessment as opposed to a standard weeklong turnaround in case of paper assignments when the students have already little interest. In addition, for training purposes, multiple attempts are quite useful.
- Help students manage their time better, take up responsibility; In the survey, many students have noted that OA supported them in developing better time management habits. In my classes, weekly OA were due at 10pm, when no help is available. Students had to learn to start the assignments in advance, to be able to use the instructor's or TA's help during the office hours.

Disadvantages of OA:

- Cost for the students;
Some sequences of courses may use the same (online) textbook and/or OA platform, e.g. Calculus I / II / III (MATH-151/152/251). When negotiating with the publishers, the Department is always ensuring that the access pass would cover all semesters required to complete the sequence plus at least one extra semester (in case of failure or personal matters). Still, some students may take longer to complete all courses covered by the deal with the publisher. Also, in case of standalone OA (no textbook) students encounter extra cost if compared with handwritten assignments.
- Require more time on instructor's side;
Currently, there are five different OA platforms used in the Department. Learning various platforms and operating OA in courses that are using different platforms simultaneously is a challenging task. In addition, dealing with student real and perceived complaints in numerous e-mails ("I solved it right but it does not accept my answer", "no internet", "servers were overloaded", etc.), changing their grades is extremely time consuming and can easily go over 20 hours per week.
- Imperfect coding:
 - Not enough randomizations, students still cheat by forming "study" groups and taking turns in submitting answers with multiple tries.
 - Programming bugs are not rare when a correct symbolic answer is not accepted without explanations.
 - Correct symbolic answer may not be recognized because of simplification or lack thereof, when for example, student answers of $1/\sqrt{2}$ or $\sec^2 \theta / (3 \sec^2 \theta)$ were recognized as wrong.
 - Minor mistakes in syntax (which differs for each platform and can be readily confused by the students if they are simultaneously taking courses with different platforms) are recognized as a wrong answer.
 - Often, only the final answer is marked, no partial marks are given.
This causes a lot frustration when a student has to carry out a page-long solution and makes a small typo along the road; paper assignment would have recognized it and given a high partial mark instead.
- Simplified pedagogical approach:
 - Mainly "drill and practice" type questions versus open-end problems.
 - Limited number of attempted "conceptual" type questions are watered down by excessive steps/explanations and templates. It may give students too much structure, thereby promoting rote learning and precluding learning of the concepts behind problem solving.
 - Many platforms offer hints and referral to exact place in the textbook or even offer a solved similar example what is good for studying/tutoring purpose but is not sufficient to be considered an assessment tool of acquired knowledge.
 - Many drill questions (e.g. when finding derivatives or evaluating integrals) can be often done using the graphing calculator, Wolfram Alpha, Maple/Mathematica/Mathlab, or other analytical mathematics software thus allowing cheating on these questions.
 - Excessive number of T/F and/or multiple choice questions may lead to trial-and-error strategy rather than learning and solving and give the students false sense of security, later resulting in low quiz/test marks.
 - Questions of the sort "Match the correct graph" instead of "draw a graph" questions send a wrong message to the students who may not get enough understanding and preparation for the hand-written tests.
"In general, I think it is very important for the homework to reflect the caliber of work that is expected of students on quizzes and exams in the course. If students are not practicing and being reminded of how to use proper mathematical notation on a regular basis, then they will more than likely do a poor job of this on

quizzes and exams. I feel that it is unfair to students in courses that use only online homework, written exams, and no quizzes for students to get penalized on the written exams because the homework does not require them to show any of their work.” (Malevich, 2011, p.16).

Findings

I will present the results of online survey of the students in Calculus II for the Biological Sciences course MATH-155 (Spring 2018) carried out at the end of the semester. Usually, that the students in this class have strong working ethics. They are determined to succeed as many of the students intend to join a medical school after getting their undergraduate science degree. Out of 108 students registered in the class, 99 students filled in the survey. Class average was a “C”-grade (GPA of 2) what corresponded to 55-59%. This course does not use any official textbook. The OA were created using the MathXL platform by Pearson publishing house. As it is shown in Figure 1, 95% of the responders were convinced that OA were useful and helpful in mastering the course material even despite all glitches with software and multiple requests for remarking.

Online assignments helped me master the content of the course

Figure 1

Online Survey Results on Usefulness of Online Assignments in Mastering the Course Content

The platform has a feature of providing the students with a solved hint example similar to the one they are solving. About 40% of the students found this feature helpful while 45% strongly agreed and agreed that it made the assignments too easy (Figure 2).

It was interesting to know the opinion of the students whether paper assignments would have been more efficient than OA (Figure 3). Here the class opinions were seriously split. The group of the weaker students favoured paper assignments: 35% strongly agreed (average “C-“, failure rate: 32.35%) and 18% agreed (average “C”, failure rate: 22.22%) that paper assignments would have been more helpful. At the same time, the stronger students (average “C+”, failure rate: 17.24%) clearly preferred OA. It is possible that the stronger students were better organized and could work on their assignments in advance, not leaving them to the night deadline. The weaker students may have liked paper assignments more because they would be still easier to cheat. This question needs to be studied more.

The average semester grade of the students in OA was 90.4% what is much higher than in case of paper assignments. This situation was observed in the previous classes as well. Since these abnormally high grades do not provide the students with true feedback on their current knowledge, I typically include quizzes in the class-marking scheme. While this class average on quizzes was much lower, only 46.26%, 52% of the students strongly agreed and 31% agreed that

In online assignments, using the solved "hint" example, made the assignments too easy

Figure 2

Online Survey Results on Usefulness of "Hint" Examples Provided by the Publisher

Paper assignments would have helped me better than online assignments, to master the course content

Figure 3

Online Survey Results on Usefulness of Online Assignments versus Paper Assignments quizzes were useful. Only a small group (4% of the respondents) disliked the quizzes, with three students among them failing the course (Figure 4). When studying the relationship between the overall course grades and quiz averages (Figure 5) it becomes clear that quizzes are reasonably good predictors of failure or success in the course.

Quizzes were helpful to master the class material

Online Survey Results on Usefulness of Weekly Quizzes

Quizzes vs course grade in MATH-155

Figure 5
Relationship between Average Quiz Results and Overall Course Grades in the Course

Conclusions

In lower division undergraduate service mathematics classes OA can be viewed as a useful quick assessment and tutoring tool. At the same time, OA are lacking sophistication and challenges if compared with the problems on the serious tests. Therefore, OA should be used together with hand-written assignments and quizzes, in order to give students an experience of writing mathematics, in particular with proofs, what will be tested later during the midterm tests and on the final exams.

Open And Closed Problems: A Comparison

Jaroslav ZHOUF
University of Economics, Prague
zhouf@seznam.cz

Abstract

This article recalls the definitions of open and closed problems in mathematics on the background of the historical course of implementing closed problems in Czech schools and their current role in the system. The main part of the study compares the positive and negative aspects of applying open and closed (with emphasis on multiple-choice) problems in the teaching and learning of mathematics. These aspects can be traced in other school subjects as well. The ideas presented here are based on four investigations – one conducted in the Slovak Republic, two others in the Czech Republic about ten years ago and, finally, on the results of a master's thesis work of the my student, and on my own long-term experience in creating problems of both types in the Czech Republic and abroad. I also include my personal view of the advantages and disadvantages involved in the use of these problems.

Keywords: *Open problem, closed problem, mathematics problem posing*

Introduction

This contribution deals with so-called open and closed problems. For detailed examples of problem classification, the reader is referred to the work of Byčkovský and Zvára (2007, pp. 16–22), Cihlár et al. (2007, pp. 7–8), and Zhouf (2010, pp. 28–29). Here, I will only take into account two of the many problem types, namely closed *multiple-choice problems*, and *open problems with an extensive answer*.

The main aim of the article is to point out those characteristics that distinguish one type from the other as well as those that they share. In the conclusion, I will further stress the inter-changeability of these two types of problems and, above all, the utility of closed problems. The reason for the latter argument can be found in the fact that closed problems are generally not perceived as quality problems by the Czech society. Such attitudes are also explained in the following text.

The methodology of the research lies in comparing pupils' written solutions to mathematical problems that were presented first in their open form and then in their closed form.

A Short History Of Multiple-Choice Problem Usage

In the book (Zhouf, 2010, pp. 29–30), there is described a short history of multiple-choice problems in the Czech Republic. While open problems have been always used in the Czech education system, multiple-choice problems have entered the scene in the Czech Republic only recently. Nonetheless, they are currently turning into a common tool for both teachers and pupils. Some similar aspects are described in the article (Zhouf, 2005, pp.139–143).

Historically, open problems probably preceded the closed ones. It is hard to tell when multiple-choice problems were first implemented. Let us mention that their wider use is first noted in the last century in North America (mainly in the USA and Canada), Western Europe, Australia and elsewhere. The many editions (since 1950) of *The Contest Problem Book* with sample problems for The Annual High School Mathematics Examinations should suffice as evidence.

This rise in multiple-choice problem usage can be attributed to the International Association for Evaluation of Educational Achievement (IEA) research. Founded in Holland in the 1950's, the IEA quickly extended its activities globally. Its most notorious research project, the Third International Mathematics and Science Study (TIMSS) in 1995, was initiated by the United States and countries in Western Europe. However, it involved many participant countries, including the Czech Republic, and gave them opportunity to contribute.

In the 1990's a similar long-term investigation was designed by the OECD. The main mathematics test took place in 2003 as the now well-known Programme for International Student Assessment (PISA). Unlike the TIMSS project, PISA focuses on pupils' mathematical literacy, connecting various mathematical areas, and testing so-called significant big mathematical ideas.

Related to the above international research, a similar national test with multiple-choice questions, *Sonda MATURANT*, was conducted repeatedly in the years 1997–1999. This test evaluated the knowledge and skills of students in their last year of higher secondary education, and was considered a pilot test for a planned standardized national leaving exam (the Czech maturita).

At the same time, publications with multiple-choice problems began to appear on the Czech market. Apart from the competition test Mathematics Kangaroo, one of the first books was 'Basic school mathematics in tests' (Matematika základní školy v testech) by Burjan and Bastlová, which was published in 1999 and contained a compilation of Czech basic (K-9) mathematical content in the test form.

Advantages And Disadvantages Of Each Of The Problem Type

The 'open vs. closed problem' discussion is a relatively common phenomenon in the Czech Republic: which of the two types is more suitable for mathematics? There are orthodox open end problem devotees, there are those who favour open problems with some tolerance for closed problems in specific insignificant cases, and finally, there are those who equally value both types. The author belongs to the final group. It should be noted that there is a very small number of people who advocate closed problems purely.

The most popular argument against multiple choice problems is that they encourage thoughtless guessing, and thus they cannot serve as a measure of pupils' real knowledge and skills. One way of dealing with this issue is to give punitive points for a wrong answer. This strategy has been adopted, for example, in the Mathematics Kangaroo competition.

Many test-makers investigate such issues: among the most prominent ones is the Scio agency in the Czech Republic, and the EXAM in Slovakia. Both of these institutions provide evidence that chance answers does not influence significantly the overall result in the case of a larger sample. The results may be distorted on an individual level only, while the whole is not affected. This finding is also supported by another Czech institution, the CERMAT, in the detailed statistical analysis by Řídká (2007).

Another argument against multiple choice problems holds that they are typically only simple problems. A more serious argument is based on the notion that one trivial (e.g. numerical) error has a fatal effect on the final answer. A multiple choice test is also believed to encourage copying during the sitting sessions.

On the other hand, there are some unquestionable advantages to multiple choices. One of them is the economical factor: multiple choice tests can cover a larger amount of content and the answers are easily evaluated. In defence of these problems it needs to be said that an open problem is equally prone to the trivial error problem, as it also consists of multiple steps any of which can lead to a taker's failure to as much as continue in solving the problem, the open problem may easily become numerically unmanageable and confusing.

One of the biggest disadvantages of open problems is the subjective factor in their scoring process - not only in case of multiple scorers but also when all scoring is done by the same person. As each pupil solution may affect a scorer in a different way, where many test-takers (e.g. at a nation-wide testing) naturally necessitate a larger number of test-scorers, objectivity cannot be assured even using rubrics, sample answers, or scoring coordinators (supervisors) (Zhouf, 2010, pp. 32). In my own experience, the difference between two scorers in the case of the Czech national Mathematics Olympiad can be up to 5 points out of a 6 point maximum. How is the situation when a pupil adopts a chance guessing strategy in a multiple choice test, operating at the 20 % probability level, different from this?

The effort to objectify open problem scoring is perhaps most manifest in institutions that conduct international research in the area of mathematical literacy across various age categories. One of the latest instruments used to this end is a pre-designed coding system: open constructed-response items require marking by a trained person who implements a marking rubric that may require an element of professional judgement. Because of the potential for disagreement between markers of these items, OECD/PISA implements marker reliability studies to monitor the extent of disagreement. Experience in these types of studies shows that clear marking rubrics can be developed and reliable scores can be obtained. (OECD, 1999, pp. 53)

Currently, the scoring system in PISA is designed in the following way: each step of the solution is coded with a double-digit code; the first digit typically assigns a degree of correctness, while the second digit denotes a particular choice of solution.

It should be apparent from the above, that such a coding system is still subjective. The reason lies in the fact that a) to anticipate all the possible solutions to an open problem is not feasible, and b) different scorers can perceive a step in a solution differently.

The advantages and disadvantages of both types of problems are discussed in further detail in (Sýkora and Zhouf, 2002, pp. 111–112), or (Zhouf, 2012), or (Zhouf, 2013).

Material And Methods

In order to see how the above characteristics of open and closed mathematical problems influence pupils' solutions to the problems and thus the pupils' assessment, it is necessary to investigate the way pupils actually solve the problems. To this purpose we will look at the results of studies in which pupils solved the same problems in both forms and analyse their written solutions. I depict three such studies: one conducted by a private subject in the Slovak Republic; one conducted by a public institution in the Czech Republic; and finally, one that preceded both of these, and was conducted by a master student where I was as a supervisor.

These three investigations took place about ten years ago. In the conclusion, a more recent study is included, one that maps out the current situation amongst teachers of mathematics in the Czech Republic, especially whether they prefer an open or closed form of mathematical problems, and how those views have changed over the span of years.

Results Concerning The Advantages And Disadvantages Of Both Types Of Problems

The first research in this area was conducted -- by a private bidder EXAM -- in Slovakia during the 1999-2001 MONITOR testing. Twelve pairs of problems were incorporated into two tests: in one test as multiple choice problems, and as open problems in the other. There were several thousand of pupils who took these tests; each pupil solved problems in only one form. The results can be summarized as follows: 'A (generally accepted) assumption was confirmed that multiple choice problems are overall easier for pupils than those requiring an open answer. However, the average difference is only 10 %, a fairly low value. Many problems showed no sensitivity to the form. There were also problems that showed worse results when posed in the multiple choice form. Those are typically problems with distractors that capture typical pupil misconceptions or mistakes. In some problems the difference in success rates for both types was relatively high – pupils were 30 % or even 40 % more successful when solving multiple choice problems.' (Burjan, 2001, pp. 10)

Another study took place in the Czech Republic during the CERMAT institute testing in the current decade. In addition to studying the reliability of both open and closed problem tests, the project also focused on the reliability in the case of various kinds of open problems (extended answer, short answer) and closed problems (multiple choice, dichotomy, matching, ordering). As concluded by Řídká (2007, pp. 169): 'The CERMAT tests repeatedly confirmed that the RIR (test item with test) correlation is significantly lower for closed problems than for open problems. Among the various types of closed problems it is the multiple choice problem that has the lowest of correlation that shows the lowest correlation. The interpretation at hand is that closed problems are, among other things, less reliable than open ones.'

The adoption of a punitive point system in multiple choice problem tests is intended to prevent massive guessing. In the above mentioned study, Řídká (2007, pp. 177) assesses the situation: '...using punitive points hardly ever affects the average result of a group. Thus it is possible, for example, to evaluate which class or which school is better. Conversely, it is impossible to compare objectively two individual test takers, no matter whether they were guessing or not. Only the data representing best test takers, those who should actually have no reason to be guessing, shows a minimal error.' Similarly, Klůfa and Kaspříková (2012, pp. 202) say that 'results can be evaluated quite easily for large number of students'.

Influenced by the debate over the suitability of closed (multiple choice) problems, I supervised a master thesis student dealing with this issue. From 1998 to 2003 Kateřina, the graduate student, investigated one of the pillars of the recent curricular reforms: the national standardized leaving exam (the maturita) in mathematics. She was creating prototypes of this part of the test, and looked for differences between a problem posed in its open and closed form, working with the solutions of high-school graduates-to-be. She designed several pairs of tests (one test with open form problems, one with the same problems in a closed form), statistically analyzed the results for both common and distinguishing phenomena. The data was collected from students of several upper secondary schools: some secondary grammar schools, some engineering schools, one business school, and one pedagogical school.

There were four versions of the tests: higher level with open problems, higher level with multiple choice problems, lower (basic) level with open problems, and lower (basic) level with multiple choice problems. Each version contained 7 problems. The allocated time was 35 minutes for multiple choice tests, and 40 minutes for the open problem tests, so that the testing could be done within one teaching period. The mathematical content of these problems was chosen to reflect the official document *Catalogue of requirements for the common part of the leaving examination in mathematics in 2004* (Katalog požadavků ke společné části maturitní zkoušky z matematiky v roce 2004). Each test version was piloted with about 100 pupils.

The graduate student conducted an item analysis for each problem, and the overall assessment of each test version. She used both the pupils' solutions to open problems and the cursory notes of pupils who solved closed problems. One analysis compared the results of tests in open and closed problem forms (there was used a punitive point system). Finally, she discussed the suitability of each item for the particular version (Zhouf, 2010, pp. 321–234).

The student was not a particularly enthusiastic advocate of the use of open problems in mathematics. Her second major was in teaching English as a foreign language (EFL). She could easily imagine the benefit of multiple choice questions in that subject, but in mathematics only with difficulty. After the study she wrote: 'The results of the investigation indicate that closed problems have a higher success rate. However, the reasons for this are not always evident (see word problems and missing answers). I found out that pupils are not able to simply estimate an answer and choose from the alternatives without doing a calculation. The same solution process for both forms was frequently evident in the written data. It would seem that the test takers who had choices provided in the test would have a certain advantage, as they could use the multiple choices to check their own solutions, or to simply guess. However, the pupils' solutions do not confirm this. It is apparent that they are afraid to take a risk in guessing when they do not understand the problem. My own belief about open problem tests' higher validity has not altered. It was merely influenced by the opportunity to take a look at the pupils' solutions of closed problems.' (Sedláčková, 2003, pp. 83–84)

Rephrasing the students' statement about the suitability of closed problems, the investigation did not shake her

beliefs, though a light trace of doubt can be detected. She further concludes that pupils are reluctant to take the risk involved in guessing the answer, but that they can learn to adopt even the guessing strategy through repeated test-taking.

The last study has been in process for the past two years. In it, the author asks teachers what form of mathematical problems they prefer. The interviews are always informal, and the number of respondents is so far around 200. Quantitative analysis is not of interest here, as the main research question is whether the views on open and closed problems, presented in the introductory section of this paper, have changed globally over the span of the past ten years. The opinion that closed problems are rather inappropriate for mathematics and should be only used in special circumstances, can be still now traced explicitly amongst teachers of mathematics in the Czech Republic.

Conclusion

To conclude, I would like to present my own point of view in the matter of open vs. closed problems. I tend towards an equally extensive use of both problem types. A suitable form of a closed problem and its effective inclusion in a test enables us to discern, well and quickly, a pupil's skills and knowledge in any relevant area of mathematics in school as well as the skills and abilities of a participant in a mathematical competition. This is more significant in diagnostics of a group sample but often also in individual cases. I believe that we do not cause bigger bias by including closed problems than by not being able to score open problem solutions without a bias.

Opinions Of Academicians On The Concept Of Social Gender Role

Melike FAİZ

Kastamonu University Turkey

mfaiz@kastamonu.edu.tr

Abstract

The study was conducted to determine academicians' perceptions of and views on social gender roles. In this research, the phenomenology design, one of the qualitative research models, was used. The study group were the academicians who were working in universities located in various provinces in Turkey and who were volunteer to participate in the research. In the study, purposive sample type from non-random sample types were utilized. In this research, five questions about gender were asked to the academicians as a means of data collection. The questions were prepared with Google Docs and collected via e-mail and Facebook. The study group consisted of 71 academicians in total. The collected documents formed the main data source of the research. The data obtained in the research were analyzed by content analysis. The results from this study can be listed as follows: 49 academicians said that there was social inequality in the family and 22 academicians said that there was no difference. 31 academician stated that gender was an influencing factor in getting a job, 15 academicians stated that gender was not an influencing factor in getting a job and 25 academicians said that this situation would change according to profession and organization. 45 academicians stated that gender was an influencing factor in being selected as a manager, 17 academicians said that it was not an influencing factor in being selected as a manager, 9 academicians stated that this would change depending on the situation. 24 academicians pointed out that gender was an influencing factor in professional promotion, 39 scholars believed that it was not an influencing factor in this and 8 academicians stated that this would change depending on the situation. 56 academics stated that gender was an influencing factor in choosing a profession, 10 academicians stated that it was not an influencing factor and 5 academicians said that this would change depending on the situation.

Key Words: *Social gender role, academician, gender*

Introduction

Sex is one of the criteria used in order to differentiate and classify people. In the simplest term and basically, while sex is biologically defined, gender is defined in a cultural sense. Sex includes the structural, functional and behavioral characteristics of all living creatures, which are determined by the sex chromosomes (Torgrimson & Minson, 2005). According to the Oxford English Dictionary, sex (*noun*) is defined as “differences in the structure and function of the reproductive organs of living beings distinguished as male and female on that basis, and the other physiological differences resulting from this.” Gender may be regarded as behavioral, cultural or psychological features which are related to a sex typically. The word gender (*noun*) was derived from the Latin word “genus” which refers to the species or race. Gender (*noun*) is defined as the type that refers to the common hominid line. In this case, sex describes the genetic, physiological and biological traits which the one has as a male or female. It can be said that sex is an ascribed status. That an individual starts to become socialized in line with the values and norms of the society in which he or she lives is called as gender.

Gender is a concept related to the roles, duties and responsibilities that the society has assigned to the one, and concerning in which ways the society regards, perceives the one and its expectations from the individual (Seçgin, F and Tural, 2011). While being related to the concept of masculinity and femininity, gender does not have to be a direct outcome of the individual's biological sex (Giddens, 2008). Dökmen (2004) stated that gender concept includes the values, expectations, judgments and roles relevant to how the society perceives and considers the individual and what it expects the individual to do. Gender has differed in time and according to the theories. This case shows that it is changeable. It reveals how male and female should behave and that there are different duties expected to be performed by them. Roles present a certain status or social expectations attributed to the social standings, and analyze the realization process of these sorts of expectations (Marshall, 1999). Gender means sex related expectations that the society has defined and expected from the individuals to realize (İsen and Batmaz, 2002). The term “sex” indicates the biological aspect of being a woman or a man. Sex is a demographic category that is determined as based on the one's biological sex. The expression written on identity cards stands for this. As for the term “gender”, it involves the meanings which the society and culture attribute to being woman or man and expectations, cultural structure and also psychological features correlated with the individual's biological structure. Gender is a whole of psychosocial properties which characterize the individual as feminine or masculine (Rice, 1996). In order to eliminate this confusion, Gentile (1998) proposed five different terms: (1) sex; expresses biological function - sexual activities - (2) biologically sex-linked; states the features linked to the biological aspect of being woman or man - like color-blindness - (3) gender-linked; states the features linked to the cultural or social aspect of being woman or man - like the acceptance of that men are more aggressive - (4) sex- and gender-linked; indicates the features of both biological and social origin - like women's dealing with baby-care - (5) sex-correlated; states the features related to being woman or man, but whether the origin of which is biological or

cultural is not known. People are born biologically female or male, but they learn to be a girl or a boy while growing up. In this way, gender is a concept developing and changing in time; it differs from one culture to the other and in time; and, the woman's and man's roles and responsibilities and the power relations between these two sexes are defined according to these differences (Tümen, 2003).

According to Giddens, gender is something learned. Babies learn their sexes unconsciously. Before children can name themselves properly as a girl or a boy, they receive a series of signs (hairstyle, scent, and etc.) that are not uttered. The children at around two years old have an understanding or comprehension, even if not complete, about what the gender is and/or means. They are conscious of their own sexes, and can also classify the others. However, children, until they reach the age of five or six years, do not know that the one's gender does not change, everyone has gender, and sex differences between girls and boys are anatomy-based. The toys which little children see around them, illustrated children books and television programs underline the differences between male and female characteristics (Giddens, 2008). Seçgin and Tural (2011) stated that factors such as parents, teachers, the mass media, and etc., have an effect on not only the child's socialization but also the determination of the individual's gender role stereotypes. Sexual socialization constitutes one of the most important learning experiences for individuals. When the child starts nursery school, he or she can distinguish between sexual roles and is able to prefer his or her sex role. Boys are defined by masculine roles and girls by feminine ones (Brown, 1956). They learn the proper behavioral patterns. Hartley (1960) states children realize that the first female role is cleaning and the first male role is earning money, when they are at the age of four. In addition to the descriptions for sex roles and relevant expectations, girls and boys also learn the expectations of the society. They learn that boys are more esteemed than the girls. And as for the differences related to personality, while boys learn how to be active and successful, girls learn to be passive and affective. The eight-year-old children define girls as virtuous, proper, quiet and mild-mannered while they define adult females as nameless, ineffective, unlooked for, bad and exploitative (Hartley, 1959). In patriarchal societies like Turkey, as gender roles are shaping, traditionally, the roles of bearing and raising child, dealing with the household chores such as cleaning, cooking, and so on, and not taking an active role in business life are assigned to woman; on the other hand, the roles of being active in business life, ruling over financial issues and being the head of the household are attributed to men (Atış, 2010; Bhasin, 2003; Dökmen, 2004; Vefikuluçay, Zeyneloğlu, Eroğlu and Taşkın, 2007; Zeyneloğlu and Terzioğlu, 2011).

Discriminations associated with business life, family and marriage affect the status of women within the society in a negative way. An atmosphere of inequality in which women fall behind men in the society has occurred. However, nowadays, with the women's taking their own parts in business life and the upward tendency in their education levels, this has undergone a change (Atanapola, 2003).

The rise in women's education levels has introduced a contemporary perspective into the gender roles for individuals, and become a determinant of equality and justice for the benefit of woman. Enabling the social awareness to be gained is quite important so that the equality of woman and man can be ensured and the social status of woman can be enhanced. Therefore, it is essential to determine the academicians' opinions on gender. The objective of this study is to assess the opinions on gender which the academicians have adopted. Accordingly, the problem statement of the study is as below:

What are the academicians' opinions on gender?

Considering how the subject of gender is analyzed in the body of literature, foreign publications will be dealt at first, and following this, domestic publications will be mentioned. In foreign literature, certain studies analyzing the attitudes towards role sharing in families (Smith and Reid, 1986; Cooper, Chassin and Zeiss, 1985), carried out on the female and male sex roles (Bradbury and Fincham, 1988), analyzing the relation between sex roles and marriage satisfaction (Lye and Biblarz, 1993; Juni and Grimm, 1994; Guzman, 1996; Lee, 1999), and determining the high school and university students' perceptions on gender roles (Kimberly and Mahaffy, 2002; Rosenkrantz and et. al., 1986; Trommsdorff and Iwawaki, 1989; Keith and Jacqueline, 2002) have been encountered.

When the relevant literature in Turkey is reviewed, the publications analyzing the relation between sex roles and marriage satisfaction (Tezer, 1992; Curun, 2006; Çınar, 2008; Demirtaş and Dönmez, 2006), and the ones analyzing the attitude, perception and opinion on gender (Aylaz, Güneş and Uzun, 2014; Baykal, 1988; Girginer, 1994; Dinç Kahraman, 2010; Sis Çelik, Pasinoğlu, Tan and Koyunca, 2013; Pınar, Taşkın and Eroğlu, 2008; Aşılı, 2001; Güven, 1996; Vefikuluçay and et. al., 2007; Ersoy, 2009; Karasu, Göllüce, Güvenç and Çelik, 2017; Seçgin and Tural, 2011; Ünal, Tarhan and Çürükoğlu Köksal, 2017; Yaman Efe and Ayaz, 2015; Çetişli, Top and Işık, 2017; Öngen and Aytaç, 2013) have been seen.

Method

1. Research Model

Phenomenological design, one of the qualitative research models, has been used in this research. Phenomenology is the qualitative research design which aims to reveal the individuals' experiences relevant to a specific phenomenon. It presents introductory information about the phenomenon that we intend to research and helps us to make sense of the phenomenon (Creswell, 2016: 78-79). Since the academicians answer the research question by benefitting from their own experiences, phenomenological design has been employed in the research.

2. Collection of Data

In the research, as data collection means, 5 questions on the subject of gender were asked to the academicians. The questions were prepared in Google docs and collected via e-mail and Facebook. 91 feedbacks in total were received. 20 of those were excluded due to reasons such as inaccurate sampling, giving incomplete information, leaving the answer blank and so on. Therefore, totally 71 academicians are included in the study group. All those collected documents constituted the core data source of the research. The answers given by the academicians were kept confidential by the researcher and were not shared with any other person. The problem statement of the research is in the following.

- What are the academicians' perceptions on gender?

3. Analysis and Interpretation of Data

Data obtained in the research were analyzed by the method of content analysis. Content analysis is among the analysis methods which are mostly employed in the studies in the field of social sciences. Content analysis is the analysis within the scope of which the existence of the research object consisting of text or texts is specified by words, phrases or sentences (Büyüköztürk et. al., 2012). In this research, the answers given by the academicians were coded and classified into categories by the researcher. Each of the answers formed was grouped by themes. Data was analyzed according to the analysis stages that were established by Büyüköztürk et. al (2012).

3.1. The stage of determining the objectives:

In this research, the researcher has aimed to reveal the academicians' perceptions on gender, through the answers they give to the questions in the interview form. The answers given by the academicians in the interview form constituted the source of data of the research.

3.2. Classifying the relevant data:

The researchers organized the data obtained at that stage as based upon theoretical framework. The academicians participating in the research were firstly grouped according to their educational backgrounds. Then, they were given codes according to their sexes. For instance, a female assistant professor was coded as Dr.F.1.

3.3. Developing the logical structure:

The answers given by the academicians participating in the research were reviewed and sorted by frequency counts and percentages. In the event that questions left unanswered by the academicians are available, these have been excluded from the research. It was determined that received answers would be arranged according to the categories developed, educational status and sex.

3.4. Determining the coding categories:

At that stage of the research, data were read and valid answers were determined. After being analyzed, the common points in the answers were detected. Considering the grounds in common, categories were formed.

3.5. Counting / Digitization:

At that stage of the research, answers were systematized by being tabulated in frequencies (f) and percentages (%).

4. Validity and Reliability

Validity in qualitative researches is the condition in which the researchers, participants and/or subjects and readers assess the same thing in the same way, in consequence of the analysis of data (Creswell, 2016). In this research, validity has been tried to be ensured by explaining the analysis of data obtained in a detailed way and giving a direct coverage to the academicians' opinions related to the findings. Reliability in qualitative researches is explained in the way that the data obtained are reviewed by more than one coder and a shared decision is made in cases where dissent is (Creswell, 2016). In this research, data have been coded, classified and also the process of forming categories has been carried out by the two researchers. The differences in views were resolved by way of the researchers' getting together and arriving at a shared decision. Patton (2014) explains this case as the investigator triangulation. Investigator triangulation is the case where two or more researchers take part in an integrative analysis by analyzing the data of a research independently, and then comparing the data obtained.

5. Study Group

The study group of the research consists of the academicians who serve at the universities in various cities of Turkey and have agreed to voluntarily participate in the research. Purposeful sampling, which is of the non-random sampling techniques, was applied in the research. Purposeful sampling means specifying a community which is the most appropriate to the issue to be studied on as the subject of observation (Sencer, 1989, pg. 386). As a feature of qualitative research, it is determined in accordance with the considerations, typicality and the condition of having specific properties that all will assist to the researcher's study. In this way, to constitute a satisfying sampling for the researcher's special needs is aimed (Cohen, Manion and Marrison, 2007, pg. 114, 115; Fraenkel

and Wallen, 2009; pg. 99). Within the scope of this research, detecting academicians' perceptions on "gender" concept has been desired.

Table 1. Demographic information of academicians

Gender	N	%	Educational Level	N	%
Female	33	46,5	Master	28	39,4
Male	38	53,5	Phd	43	60,6
Total	71	100,0	Total	71	100,0

1-2	36	50,7			
3-4	14	19,7			
5-6	9	12,7			
7-8	1	1,4			
9-10	3	4,2			
Total	71	100			

Findings

In this part of the research, the answers which the academicians had given to the questions related to gender were initially subjected to the content analysis, and thereafter, interpreted and presented in tables.

Table 2. Academicians' opinions on the effect of gender differences in family

	f	Category	Theme	f
Yes	49	Social Reasons	Customs	9
			Social Directions	8
			Patriarchal	5
			Point of View	3
			Environment	2
			Media	1
		Biological Reasons	Physical Power	5
			Predisposition/Talent	6
			Temperament	3
			Mother-child Communication	2
No	22	Educational Level		2
		Responsibilities		12
		Mutual Life		10
		Modernization		1

In Table 2, academicians' opinions on gender differences in family are presented. The answers that they had given were analyzed by categorization and thematization. 49 of the academicians have mentioned that gender difference is effective at home and the mentioned effect depends on social and biological reasons. Among the social reasons, the ones restated at most are that customs, i.e. social mores, are highly effective, the society directs individuals and the differences result from the patriarchal family structure. In terms of biological reasons, the ones mostly repeated in the opinions expressed by the academicians are in the way that the distribution of tasks is according to the abilities and/or talents of sexes, and the man is active in situations requiring physical strength and power. Apart from this, the number of academicians who have stated that sex is not effective is 22, and the reason of why they say no can be seen from their statements indicating that the responsibilities in the family are equal and life is mutual.

The sample of answer:

Dr. F. 58. *Yes. Because of the ways we are raised, some tasks are suitable for men, and other tasks are suitable for women. Apart from that, I think that women's jobs in the house, probably because they spend more time at home than men. Usually, women finish household chores more diligently. For example, for men, some household tasks are done in a fast fashion unlike women. While men place dishes at random in the dishwasher, women place the dishes more precisely and more often than not in a way that they can fit in the contaminant. If they were placed by a man, the woman would probably replace those dishes and allow more space for other ones. Thus, the dishwashing work is done twice. Instead, the woman may prefer her husband to do the shopping. I think there is a task sharing in every house. A share in which the woman and the man take on the tasks she can do better in her ability.*

Table 3. Academicians' opinions on gender difference in acquiring job

	f	Category	Theme	f
Yes	31	Job-related Reasons	Employer's point of view (9)	23
			Required qualification (14)	
		Reasons Related to Women	Marital status / Child (6)	19
			Benevolent sexism (5)	
			Responsibilities (4)	
			Sexism (2)	
			Pregnancy (2)	
			Confidence (1)	
		Reasons Related to Men	Labor / Work force (6)	11
			Men in the forefront (5)	
		Social judgment / expectation		2
No	15	Achievement		5
		Competence		4
		Service Sector		2
		Should not be effective		1
		Pulling the wires		2
Sometimes	25	According to Profession		17
		According to Institution		7
		According to Position / Status		1

In Table 3, academicians' opinions on gender differences in acquiring job are included. The answers given by them were analyzed by categorization and thematization. Most of the academicians (n=31) have expressed their opinions in the way that gender difference is effective in acquiring a job. They have stated that the reason of why they answered in that way is its being related to job and especially resulting from being a woman or man. They have also stated the qualification required by the job and the importance of the employer's point of view, that women may have difficulty in acquiring a job if they are married with children, and on the other hand, as some business enterprises attach particular importance to appearance, women may acquire job in an easier way. Moreover, they have expressed that it can be easier for men to acquire a job since they are strong and do not have any special cases like pregnancy. Answers indicating that gender difference is not effective have been also received from the academicians (n=15). The reason for these answers has been explained in the way that the one who is successful and competent would acquire the job. Beside this, there are also academicians who state that it will change according to the case (n=25).

DR. F. 13. *Yes, because women have different responsibilities. Male employees are the reason for preference. Turkey Statistical Institute data for 2016 says that one-fifth of female employment of male employment. There is no clear scientific conclusion, but single women and married male employees are preferred especially in the private sector. It may be because single women are more independent and married men have more regular lives.*

In the meantime, you should not ignore a segment of the population who seem very modern from the outside that believes that women are shrinking the business sector, and believes that a child should be looked after at home. Unfortunately, women are also under the influence of manipulative psychologists like Adem Güneş, and they have begun to betray their children to continue their working life. In recent years, we have been slowing down on these issues, which may be another study issue.

Table 4. Academicians' opinions on gender difference in being elected as executive

	f	Category	Theme	f
Yes	45	Reasons Related to Men	Logic (12)	27
			Authority (6)	
			Dominancy (4)	
			Leadership (3)	
			Achievement (2)	
		Social Reasons	Patriarchal (5)	11

		Ideological Favoritism		2
		Increase in Female Employee Rates		1
Sometimes	9	According to Job		5
		According to Institution		3
		Occupational Expectation		2
		According to Person		2

In Table 4, academicians' opinions on gender difference in being elected as executive are involved. The answers given by them were analyzed by categorization and thematization. Most of the academicians have expressed their opinions in the way that gender difference has an effect on being elected as executive (n=45). It was seen that the personal reasons arising from the women and men themselves and additionally the structure of the society are effective in terms of being elected as executive. It was stated that men are elected as executive due to the fact that they are logical, can easily assert their authority and are dominant characters. Moreover, they have stated that women are not elected as executive since their responsibilities at home are much, and due to the gender-based approaches to women and a point of view related to glass ceiling syndrome keeping women from rising in the ranks no matter how hard they try. It was pointed out that gender would lead to a great difference in advancing in the career and/or business life as socially a patriarchal structure is possessed and the society has certain prejudices as a consequence. Besides, some of the academicians have expressed that it does not have an effect (n=17). They have stated that the one who is successful can get his or her promotion as based on the view that women are equal men in being executive. In addition to this, academicians stating that it will change according to circumstance (n=9) are also present.

Ms. M, 38. *Yeah. Women do not act professionally because they are emotional beings.*

Table 5. Academicians' opinions on gender difference in being promoted

Table 3: Academicians' Opinions on gender difference in being promoted				
	f	Category	Theme	f
Yes	24	Social Reasons	Social prejudice (7)	15
			Social perspective (6)	
			Social expectation (2)	
		Reasons Related to Men	Easy for men (5)	9

		Qualification	3
		Equity	3
		Should not be effective	2
		Pulling the wires	2
Sometimes	8	According to Position / Status	5
		According to Institution	2
		According to Person	3

In Table 5, academicians' opinions on gender difference in being promoted are presented. The answers given by them were analyzed by categorization and thematization. Most of the academicians have expressed their opinion in the way that gender difference is not effective in terms of being promoted (n=39). They have stated that woman and man are equal when it comes to be promoted, and the one who is successful will advance in his/her business life. Also, some of the academicians have put forth that gender has an effect upon being promoted (n=24). The reason of its being effective has been explained by the views indicating that it can result from a social prejudice, and additionally, a negative social perspective towards the woman's getting promoted exists, men advance in their careers more easily and woman's responsibilities and/or duties at home are also effective in this sense. Moreover, there are academicians stating that it will change according to circumstance (n=8).

Dr. F, 58. *No, I think they are more fair in career upgrades. In particular, I think that the gender discrimination in the career upgrades. through examinations is not taken very seriously.*

Table 6. Academicians' opinions on gender difference in the choice of profession

	f	Category	Theme	f
Yes	56	Social Reasons	Expectation (14)	34
			Cultural Structure (11)	
			Social Pressure (4)	
			Social role (2)

			Women's travel restrictions	
Sometimes	5	Modernization		5
		Desire		3
		Merit		2
		According to Profession		1
		According to Person		1
		Job Definition		3

In Table 6, academicians' opinions on gender difference in the choice of profession are involved. The answers given by them were analyzed by categorization and thematization. Most of the academicians have expressed their opinion in the way that gender difference is effective in being promoted (n=56). They have clarified the reason why they gave that answer by stating that it takes its source from the society itself and individuals; the society has an expectation from men and women to choose some certain professions; the cultural structure requires for individuals to make this choice; and women and men are more predisposed to some professions in terms of their physical and emotional structures. Some of the academicians have also stated that gender difference is not effective in being promoted (n=10). They have explained the reason of giving this answer by stating that women and men can choose a profession at their own pleasure by virtue of modernization. Additionally, academicians who have expressed that it will change according to circumstance (n=5) are also present.

Dr. F, 1. *Certainly there are some features that bring the sexes, but they can vary even within the same sex. I think that the individual has a direct relation in choosing a self-sufficient profession.*

Conclusion and Discussion

49 of the academicians have stated that social disparity exists within the family, and 22 of them have asserted that there is no difference. Academicians have put forward that customs and traditions are influential, and additionally, the society directs individuals and has a patriarchal structure, as the reason of this social inequality in the family.

Öngen and Aytaç (2013) explain that the reflections of gender roles on communal living shape the women's and men's lives in different ways as traditional and egalitarian roles. Karasu and Göllüce (2017) have stated that gender-based discrimination has its root in the family itself, and women and men who approve gender inequality will have been raised, in conclusion, as based upon the fact that girls and boys are directed differently by the society. Considering the biological reasons, they have expressed their opinion in the way that sexes have different distribution of roles according to their abilities and man is more active in the situations requiring strength. In the body of literature, it has been seen that men deal with the out-of-home activities which require power and/or strength, while women engage in domestic responsibilities such as cooking, cleaning and so on (Weitzman et. al, 1972: 1125). Apart from this, the number of academicians stating that gender is not effective is 22, and they have also expressed that the distribution of tasks is performed equally. Families are known to be important institutions in the process of socialization. Families convey their own world-views to their children while raising them; however, children learn various things during the process of communication with the other people around, are affected by the media, television programs and books, and also acquire the others' views and stereotypes of the social circles where they are in (Arat, 1996). So, this promotes the results of the study.

31 of the academicians have stated that gender difference is effective in acquiring job; 15 of them that it is not important in terms of acquiring a job and 25 of them that it will change according to the profession and institution. 56 of the academicians have expressed that gender difference has an effect upon determining or choosing the profession, 10 of them that it is not effective and 5 of them that it will change according to circumstance. Starting from this, the conclusion arrived at is that gender stands for an influential factor in acquiring job, getting job and being elected as executive. In regard to be promoted, that gender difference is not considered as effective is concluded from the answers given. The existing stereotypes indicating that women are emotional, but men are not (Dökmen, 2012) and that women are considered as more sensitive, interested and caring while men are perceived as independent, assertive, with a leader spirit and strong lead them to serve in professions including these features (Dökmen, 2004). In the study carried out by Gönüllü and İçli (2001), the most suitable professions for girls have been specified as teaching, civil service, and they have decided on the professions such as engineering, advocacy, and being a doctor for boys. Çelik et. al (2013) have given a coverage to enabling woman to participate in communal living on an equal basis, preventing woman from being detached from working life by the articles related to pregnancy and maternity leave, opening kindergarten and day nurseries and so on, within the scope of the regulatory laws on working life, and strengthening the unity of family. This case is for preventing women's being detached from the business life. As is seen from the results, it has been observed that women in Turkish society are thrown background out of focus in working life. The perspective of the society and the employer's point of view have been shown as the reason for this. Physical and emotional characteristics of women have sometimes been reasons for preference; but however, sometimes they have not been preferred because of these same characteristics. Women's taking in charge actively for domestic life accelerates their being detached from professional life (Özçatal, 2011).

45 of the academicians have stated that gender is effective in being elected as an executive, 17 of them that it is ineffective and 9 of them that it will change according to circumstance. 24 of the academicians have expressed that gender difference is effective in being promoted, 39 of them that it is not effective and 8 of them that it will change according to circumstance. Leadership is to gather people on the basis of specific objectives and also the whole of knowledge and skill which will motivate people into realizing these objectives. Leadership is the skills which are inherent in every individual, can be potentially learnt and are improved (Grossman and Valiga, 2005). From past to present, in almost all societies, women have not been represented enough in the world of power, leadership and business which stands for the world of men; professionalism, authority and leadership have been the characteristics or traits identified for men (Terzioğlu and Taşkın, 2008). In the study carried out by Brooks and Bolzendahl (2004), it is seen that individuals exhibit positive attitudes in terms of the effects of gender perspective on woman's leadership behaviors. In this study, academicians have stated that women's responsibilities related to domestic life, as well as their physical and emotional traits, pose an obstacle for them to be elected as an executive. In literature, although publications asserting that men are acceptable as executive are generally encountered, the exact opposite result has revealed in the study which Aylaz et. al (2014) carried out. In other words, women are also able to carry out the executive task inasmuch as men can do. Judgments towards women such as their working in lower-paying occupations, not being able to work without receiving their husband's permission and/or consent, not staying out at night and not living alone, and mother role in family still exist; and as for men, the consideration of assigning the reverse roles is common. These sorts of discrimination affect the woman's social status negatively. Woman falls behind man. Yet, at the present time, this situation has changed in favor of woman (Attanapola, 2003).

Suggestions;

Academicians' perceptions and detections for gender have revealed highly important outcomes. Accordingly, the following suggestions can be brought forward.

In Turkey, within the scope of higher education programs, lectures for Gender can be included. Paying attention to that the contents of these lectures be same for each educational institution can be suggested. These lectures should be in interrogating quality, participative and responsive.

This study is in the quality of a fenemongly. New studies can be carried out by different methods. These studies can be performed with different sample groups. Also, the studies can be repeated with the same sample groups at regular intervals. Thus, it can be observed whether a change is in question, or not.

Academicians are the figures significant for the society. Various panel discussions can be arranged and/or organized in order to inform the individuals by the academicians who have studies on gender.

Opinions of School Principals on Financing Primary Education in the Context of Neoliberal Politics

Arslan BAYRAM

Faculty of Education, Artvin Çoruh University Artvin 08100, Turkey
abayram@artvin.edu.tr

Abstract

The aim of this research is to provide insights into how funding for basic education, which is not beneficial to public financing, is provided by educational administrators and which problems they are financing while providing financing. In the study, in-depth interviewing technique was applied from qualitative research methods. In the study group of the study, criteria sampling method was used for purpose sampling methods. A group of eighteen school principals, three primary and secondary schools with high socioeconomic level and medium and low levels, were established in Ankara with the objective sampling method. An interview form was created by the researcher, presented to field experts working in the field of educational economics and reorganized by taking their opinions. For clarification of the interview questions, three school principals were also pre-applied, and unanswered questions were rearranged. Descriptive analysis and content analysis techniques were used to analyze the research data. In the survey, 18 primary schools (preschool-primary-secondary school) were interviewed. There are 6 administrators from each type of school. Six of the schools were selected from low-economic, medium, and relatively economical regions. Eight of the managers are female and 10 are male. Managers have more than five years of experience, 11 to 5 to 10 years, and 4 to 10 years of management experience. School income sources are generally referred to as fees, donations, registration fees, and income from various activities. It has been found that the public contribution is transferred to schools in very little service, and the resources transferred to private schools increase inequality in education.

Keywords: *Education; Education Finance; Primary Education; Neoliberal Policy*

Introduction

Education is one of the most important services that determine the future of an country. Because education has benefits both for the individual and for collecting. Education remains a matter of debate whether the financial resources allocated will be met by the public or beneficiaries of the education service. The Board (2002) describes education as a personal and social investment that is provided to different sectors, such as employers and the state, international organizations, as well as students and families. In this research, it is discussed who will meet more financial resources. The financing of public education away with the neoliberal transformation taking place in the world and Turkey is gaining weight and who benefit from the educational services that meet the required financing. compulsory education in Turkey said that although Although such services have to be met by public funding on the one hand, compulsory schooling families. As stated by the Council (2012), it is observed that there are two approaches to providing education in the world. These are the approach of financing education to the public budget and the approach of financing educational funds to beneficiary students and families. In our country where neoliberal economic policies are applied, it can be said that the second approach gains importance in education financing.

There are generally three different approaches to financing education in the world. One of the approaches to education-funded "direct financing" is the public funding of education expenditures, ie taxation approach. The state meets the educational resources with the tax as if it were in the public good. The second concept is the "indirect (private) financing method" in which financial resources in education are financed from the students' families. Education is to pay for the goods with fees instead of taxes. Thirdly, the "hybrid financing method" is a "partial financing" approach based on the direct or indirect funding of all segments benefiting from education. Educational resources are financed by the public and private sectors. While the state supplies training goods, the private sector also recognizes this privilege and reduces public financing by providing privatization of education in a sense. In other words, it pays education financing completely to those who use education services. There are many researches on this subject (Ünal, 1996, Adem, 2008, Karakutük, 2017, Board Tural, 2002, Tonbul, 2016). Analyzing the structure of education expenditure in Turkey is a very important part as 37% of total education expenditure is carried out by private enterprises. In the OECD average, however, only 12% of total education expenditure is made by private sources. made by public spending on education in Turkey remains behind the OECD average (ERG, 2009). In this case, it is seen that education planning and finance management are centralized and localization policies are applied in practice (Karakul, 2014). In line with development plans, the development of the financial policies of education programs is mostly based on the state financing of compulsory

education, participation of educated beneficiaries in expenditure at other levels of education, saving as much as possible in education expenditures, raising the resources to be allocated for training with general budgetary funds and increasing the share of private enterprise in education service provision (Küçük, 2010).

General education policies in Turkey, the number of work produced in the context of special education funding policy is limited. There are many reasons why researchers work in a limited manner in their policy of financing education. This is because individuals perceive politics as an element of conflict and thus confuse the data collection process, or school administrators tend to accept education policy and education funding politics in particular as a result of being left passive, and to give up the solution. Nevertheless, any change in the policies related to educational institutions can affect the schools that are the smallest unit of the education system, and the administrators and teachers working in these schools, positively or negatively (Altunay and Ağađiken, 2016). In this study, it was aimed to show the opinions of how the education administrators provided financing in the basic education which is not injured by public finance, and what problems they faced while providing financing.

Method

In-depth interviewing technique is applied from qualitative research methods. In-depth interview Punch (2011) is a good way to make people aware of reality, its meanings, its description, and its construction. It is a technique that examines in detail the research topic by asking open-ended questions in depth interview, listening to them, recording answers and asking additional questions related to them (Kümbetođlu, 2008). The participant is experienced at the beginning of the interview period, and the researcher is also curious. As the differences in the points of view during the process become apparent to the researcher, the researcher's assumptions decrease. The participant also undergoes a change due to having narrated his story in depth (Seggie, Bayyurt, 2015). A purposeful sampling method was used in this study.

The study group

In the study group, criteria sampling method was used for purposeful sampling methods.. Criterion sampling is the creation of samples of people, events, objects, or situations that have the qualities set in relation to the problem (Büyüköztürk et al., 2009). The advantage of this approach is that researchers use their previous knowledge and skills in the selection of subjects (Balci, 2007). A group of eighteen school principals, three primary and secondary schools with high socioeconomic level and medium and low levels, were established in Ankara with the objective sampling method. An interview form was created by the researcher, presented to field experts working in the field of educational economics and reorganized by taking their opinions. For clarification of the interview questions, three school principals were also pre-applied, and unanswered questions were rearranged.

Data collection and analysis

The interview form prepared was submitted to the opinion of field experts in order to check the relevance, suitability and applicability of the grade for the purpose of the research. An interview form has been arranged according to the recommendations of the experts. Expert examination, participant approval and negotiations with the managers have long been tried in the research to ensure internal validity through long-term interaction. In addition, the consistency of the findings from collected data was checked to increase the plausibility of the data. Towards this, the consistency of the findings with the conceptual framework used in the development of the interview form was constantly checked.

The data of the study were collected during the time when the participants could express themselves easily and in the environments where voice recording could be done, when they made an appointment. Interview questions were directed to each participant with the same words.

Descriptive analysis and content analysis techniques were used to analyze the research data. Descriptive analysis; (Yildirim and Şimşek, 2013), where the data obtained are summarized and interpreted according to a pre-determined theme, frequently the direct quotations are used in a striking way to reflect the views of the interviewed individuals, and the results obtained are interpreted in terms of the causal relationships. The descriptive analysis technique was performed within the framework of three steps of efficacy (reduction of data, presentation of data, conclusion and validation) (Türnüklü, 2000). In the presentation of the data, the criteria for the selection of the citation (different opinion), explanatory (suitability to the theme), diversity and extreme examples were taken into consideration (Ünver, Bümen ve Başbay, 2010).

Results

The findings of this study aimed at revealing the problems faced by the principals of primary education schools (elementary and junior high school) in financing their schools and the methods they have found to cope with these problems have been revealed.

In the survey, 18 basic education schools (preschool-primary-secondary school) were interviewed by the manager. There are 6 administrators from each type of school. Six of the schools were selected from low-economic, medium,

and relatively economical regions. Eight of the managers are female and 10 are male. Managers have more than five years of experience, 11 to 5 to 10 years, and 4 to 10 years of management experience.

School income sources

Managers of income sources of primary education schools, income from school-family reunions, voluntary donations, donations received in transcripts and transfers, income from sports theater fees, school theaters and demonstrations, revenues from kermes and festivals, photocopy and examination paper fees, they are trying to provide resources such as the resources they have obtained from the kindergarten of the schools in which they are located. The views of some of the school administrators are;

School-family association contributions, voluntary donations, donations received in transcripts and transcriptions, sports line fees, income from school theaters and shows, revenues from kermes and festivals, photocopy and examination paper fees, the sources of the kindergarten in the schools that have the kindergarten, school services, school dining hall rental, canteen rental

EA-5. Our first source of income is the donation of the lord. The school is demanding a family union.

How do you describe yourself when you generate these revenues?

A good marketer, a good bargain merchant, the person who should be sore, beggar, business owner,

EA-9. We're trying to convince like a full salesman, my child, actually I realize how far I am from my educator identity.

EA-8. It looks like 5 -10.000 TL for someone to look cute every time.

Public support

Electricity, water, certain amounts of fuel (natural gas), telephone and internet payments and certain payments for repair

EA-14. Since we use electricity, water, telephone and internet for approximately 1000-1200 pounds, we transfer the invoices to the system. He's paid in a couple of days.

EA-18. We are paid electricity, water and international, but we have problems in warming up. My school is a large school with just enough gas given weekly. I need support from the parents.

Maintenance and repairs

It has been found that education administrators can not receive public support at adequate levels in maintenance and repair of buildings and classes.

EA-2. When you want to repair from the general budget, it is evaluated on the ground later in the county. If 50-60 schools are applying for general repairs, 5 of them may have the chance this year.

EA-11. It is necessary to care for the building (annual roof, paint the building). You have a source, or you do not.

School stationery expenses

Educational administrators say that the school's stationery expenses are not met publicly and these expenses are covered by donations collected from the students.

EA-4. There is no allowance for teaching-learning services. However, materials can be requested in the form of stationery, toner, photocopy. Sometimes he comes, sometimes he does not. We demand from the students as copy money for us.

Service purchase expenses

Educational administrators say that they are not in sufficient numbers and that the school is in the process of receiving services to meet adequate staff, but that the school is very difficult to do so.

EA-12. The school has a permanent staff. 18 people (security, cleaning, civil servants) are employed as staff with Family Union facilities. We're stuck in their pay. The staff of the school will be able to meet the need, even if no other money is given.

Private school support

They expect to provide education and training support to private schools in public schools as well.

EA-11. Private schools are already getting money from their students. I do not think the state gives money to schools that have no money problems, not their own school.

EA-15. It does not make any sense to fund private schools. If we give half of those funds to state school, we will not deal with such problems at all.

Equality in education

The inequalities between schools have led to the discovery that the student also leads to inequalities in benefiting from educational services.

EA-9. Equality is not possible to provide. Regional and presently varying school income

EA-5. One of the problems faced as a result of school-level politics is the question of equal opportunity and equality in economic terms. We can say that we are collecting money with binary relations.

Problems that create finance in educational administration

Educational administrators have been able to find that they are unable to do educational management, which is their primary task while trying to provide financial support to the school, and that they spend all their time financing the school to live.

EA-1. I am very tired of the helplessness in monetary matters. Schools that do not have monetary inconveniences become more productive.

Discussion

The income sources are increasing or decreasing according to the school environment. While the income sources of the schools in the rich regions are diversifying and multiplying, the diversity of the income sources of the schools in the poor regions is decreasing and even it is the source of the single income.

It seems that educational administrators behave as a merchant trying to manage and live their business by leaving educational administration, which is the primary task of income generation, as an edge. This situation commercializes the relationships in the school and shows that they perceive it as a student / child customer.

Due to the limited public resources in basic education, it may be considered as a disadvantage for these schools that school principals need to look for private resources. Especially at this stage, it is seen as a source of funding for schools. Household education expenditures also support this finding.

Table 1. Household Education Expenditures (2010-2015).

The types of spending by income group share in 20% sequentially, Turkey, 2010-2015		Total	Income group				
			1. % 20	2. % 20	3. % 20	4. % 20	5. % 20
2010	Educational services	100,0	3,3	6,3	10,7	19,4	60,2
2011	Educational services	100,0	3,3	5,2	11,0	18,2	62,3
2012	Educational services	100,0	2,3	5,6	9,0	16,3	66,8
2013	Educational services	100,0	2,5	6,2	10,8	17,1	63,5
2014 ⁽²⁾	Educational services	100,0	2,2	5,6	10,6	16,9	64,7
2015 ⁽²⁾	Educational services	100,0	1,6	4,3	8,6	16,6	68,9

Source: TURKSTAT, Household Budget Survey 2016.

Starting from 2014, the new administrative division in sampling design has been taken as a basis

With the neo-liberal economic policies and the implementation of educational policies, public investment in education has decreased and on the contrary public support and private schools have been increased. The privatization efforts accelerated especially with the economic decisions of January 24, 1980.

The aim of "restructuring" practices in education is to transform educational administration into a profitable investment. Thus, all stages from the teaching process to what kind of information will be given and how the teacher will behave to the class have been rearranged and transformed the right to education, which is the fundamental human right, into a commodity,

Together with the neoliberal educational policies implemented, education becomes a right and becomes a commodity that can be bought and sold. Both the deterioration in the income distribution and the reduction of public expenditures together with these policies harm the right to education. Education is the only way to turn it into a privilege that can be enjoyed by those who have money. Nevertheless, these privileges in education lead to increased reproduction of inequalities existing in society.

Table 2. Private school support by years

Year	Preschool		Elementary school		Secondary school		High school/Basic High school		Total Student	Total Support Amount
	Number of students to be supported	Support Amount	Number of students to be supported	Destek Miktarı	Number of students to be supported	Support Amount	Number of students to be supported	Support Amount		
2014-2015	50.000	2.500	50.000	3.000	75.000	3.500	75.000	3.250	250.000	765.625.000
2015-2016	20.000	2.680	50.000	3.220	50.000	3.750	110.000	3.750	230.000	770.530.000
2016-2017	6.000	2.860	15.000	3.440	15.000	4.000	15.000	4.000	3.440	266.100.000
2017-2018	6.000	3.060	15.000	3.680	15.000	4.280	15.000	4.280	3.680	290.200.000

Source: National Education Statistics 2010-2017. Ministry of National Education Publications, Ankara, 2017.

As can be seen from Table 2, public resources are already being transferred to private schools offering paid education services. This resource transferred to private schools expresses that the administrators of public schools should be given to their own schools. This situation further increases inequality in education.

Opinions Of The Turkish Language And Literature Participants Who Are Registered To The Pedagogical Formation Certificate Program And Who Have Questions About Their Correspondence In Teaching Practice

Aygül OKTAY
Bolu İzzet Baysal Üniversitesi
ayguloktay@hotmail.com

Goal; the aim of this study is to determine the problems faced by the students of the Turkish Language and Literature Field registered in the pedagogical formation certificate program in their practice schools in the Teaching Practice course.

The study group; it is a qualitative study based on the opinions of fifteen students enrolled in the program of Abant İzzet Baysal University Faculty of Education Teaching Formation of the graduate student or graduate student of the Department of Turkish Language and Literature in the Second Term of the 2016-2017 Education- .

Data collection tool; The data were collected through a semi-structured interview form with open-ended questions prepared according to the pre-determined theme. Themes, A) Educational and educational problems in the application school: 1. Knowledge of the field, 2. Managing the teaching and learning process (1. Planning, 2. Preparing for the course, 3. Using the teaching principles and methods, 4. Communicating with the students, Classroom management and student relations 6. Students' learning assessment, 7. Self-confidence, B) Administrative problems in the school. Two field experts were consulted for the coverage of the Interview Form which was prepared in accordance with the template. Fifteen student interview forms were applied and fifteen complete interview forms were included in the evaluation.

Analysis of the data; interview forms were carefully monitored for content analysis, 1) coding stage, 2) screening stage, 3) category development stage, 4) validation and reliability assurance phase, and 5) frequency calculation and interpretation phase. In order to ensure the validity and reliability of this qualitative study, the data have been examined in detail. Coding was done by a doctoral student with researcher and qualitative working experience. Miles and Huberman's reliability formula is applied. (Reliability = agreement of opinion / agreement of opinion + difference of opinion) The two codes of opinion were re-assessed and agreed to provide 100/100 views. Coded problems are divided into categories according to pre-determined themes. In the tables prepared according to the hypothesis, the frequencies determined according to the frequency of expression of the two least acknowledged participants of the codes. Care has been taken to reflect the views of the participants as they are. The findings have been tried to be interpreted.

The major findings: Theme1. Area information; Difficulty in not knowing the curriculum program (f = 11) and adapting it to the student level (f = 12) 2. problems with the teaching and learning process; Theme 2.1. Making plans: difficulty in making plans (f = 15); Missing plan (f = 13) Theme 2.2 Preparation for the course; Failure to find appropriate course material for the topic (f = 11), failure to find sources other than the course book (f = 5); theme 2.3. (F = 14), Forcing practice of teaching principles and methods (f = 13) Theme 2. 4. Communicating with students: complaints that students did not listen to themselves (f = 11), Word Talk without getting the right (F = 10) Theme 2.5. Class management and students' relations: The lack of time (f = 14) The inability to collect the attention of the students on the subject (f = 11), the failure to rule the class (f = 9) : No time for the evaluation (f = 12), difficulty in writing the evaluation question (f = 8) D 7. Self-confidence; Very excited (f = 15), theme 3) The main administrative problems they encounter in the practice school are; (F = 15), failure to consult outside the class with the application teachers (f = 14), Failure to consult the application instructor because of the courses they had during the university course (f = 7), Not knowing the administrators apart from the manager = 7), Only seeing the schoolmaster once (f = 7), Appointment with a maximum of two branch teachers (f = 7) except for the application teacher. The identified problems overlap with the research done in this area.

As a result, it can not be said that students from the Teaching Practice course have gained the optimum level of experience. For the solution of students' problems: Teaching Practice lesson should be increased and include at least two academic semesters. Application lecturers and students should be gathered and discussed frequently during the course monitoring and should be aware of the missing lessons with the lessons that will be given to the application students. For example; Planning and implementation according to the objective and achievements of the course, selection of teaching principles and methods in accordance with achievements and subject, conscious use of educational technologies and taking into account individual differences can be taught. Criteria must be

selected carefully in the selection of application instructors and teachers. Implementation students can be introduced to all managers and teachers for positive communication and interaction with their colleagues. In general, attendance at school activities can be provided. They can organize activities with students. Also, It can recommend to make observations about the management process and functioning in the school, to communicate with the managers, to participate in the managerial processes and to accompany the guard teachers.

Opinions Of Undergraduate Freshman Students Of The School For The Handicapped On Career And Career Awareness

Zehranur KAYA

School for the Handicapped Anadolu University Turkey
znkaya@gmail.com

Abstract

It is aimed at this study to examine the knowledge of the career and career awareness of 16 hearing impaired students, newly enrolled in the Graphic and Ceramic Undergraduate Programs of the School for the Handicapped (SfH) of the Anadolu University in the educational year of 2017-2018. According to the research findings, the restructuring studies that are realized in the courses and course contents have been planned according to the research findings. A questionnaire where 41 questions containing 25 closed-ended and 16 open ended answers have taken place, were applied to the students. The questionnaire consists of the sections, titled as “*Personal Information*”, “*Information on Education and School for the Handicapped (SfH) of the Anadolu University*”, “*Acknowledge About –Associate-Definition of Career Conception*” and “*Looking for Employment/Job After Graduation, Finding Job Advertisement and Job Application*”. A descriptive analysis has been used in order to determine the opinion of the hearing-impaired students with relation to the career. It is understood at the research that 68 % of the students do not know about the career conception and 81 %, however, about career planning. It has also been seen that 88 % of the students have taken examination called as E-KPSS (E- Public Personnel Selection Examination) in the career plan and become (public) officers or employees. Furthermore, it has also been understood that 56 % of the students had no knowledge about the documents, required in the job application, and 80 % of them had opinions on the job interview, 13 % had job interview in advance and 13 %, however, were able to write the definition of the job interview correctly. It has been seen that 19 % of the students knew what the job application file was, and 75 % of them knew about the Turkish Employment Agency and thought that they might benefit after their graduation.

Introduction

The career means that the progress of individual in the profession, decided upon by him and acquirement of experience by developing himself. The career process covers the education process of the individual. All stages of the education are a part of the career (Adıgüzel & Erdoğan, 2014; Sharf, 2006; Şimşek & Öge, 2011; Yeşilyaprak, 2012). The career planning, however, is to plan the educations, already taken and due to be taken in advance within the career direction and then, realize the same (Brown & Brooks, 1985; Campbell, 1997; Isaacson & Brown, 2000; Sharf, 2006; Yeşilyaprak, 2012). For making a career planning, it is necessary to search what the processes with relation to the career, determined before all else, namely, to have a career awareness. The individuals having the career awareness make progress faster to their targets when they started to their professional lives (Korukoğlu, 2003; Rae, 2007; Türkoğlu, Gavcar & Büyüksakallı 2013). However when it is focused on the career awareness researches, it is indicated that the individuals do not have sufficient career awareness (Özdinçler, Tarakço & Aslan, 2015; Sharf, 2002). This circumstance shows that the individuals cannot make necessary plans properly for due progress in their profession either. The career planning is an important process for the employment of the individual.

The employment and employability are different concepts. The employment is the work of an individual at a job whether it is related to his career or not and mostly indicates a temporary circumstance. The employability, however, is for the individual to work in a profession, selected by him, in a permanent manner in order to make contribution to himself, workforce, society and economy and a number of skill, knowledge and personal qualifications raising the possibility of his success (Bhaerman & Spill, 1988). In this context, it is important to prepare training environments where it is possible for the individual to acquire skills to increase the possibility of his employability. When the body of literature is examined, it is seen that there are researches determining the career awareness of the hearing and hearing-impaired individuals and clarifying the educational environments to be prepared for raising such awareness, however, they appeared to be not sufficient (Dursun & Aytaç, 2009; İstel, 2018; Karasu, 2018; Kaya, 2017; Kaya, 2012; Kaya, Özten Anay, Abalı, Karasu & Girgin, 2017a; Kaya, Özten Anay, Abalı, Karasu & Girgin, 2017b; Kaya, Özten Anay, Karasu, Abalı & Girgin, 2017; Kozak & Dalkıranoglu, 2013; Rae, 2007; Sarıkaya & Khorshid, 2009; Yılmaz, Dursun, Pektaş & Altay, 2012).

The economic conditions of our current period have made it necessary for the individuals to make their career planning. It is the legitimate right of the young people to find a job and work at the job, desired by them. However, the individuals work at the jobs wherever they find instead of planning their own career in our country where the rates of unemployment exceed 10 %. The increase of employability is related to making their career planning in a proper manner (Bhaerman & Spill, 1988). Inclusion of the career planning activities in every stage of the education

will help the students to make their career planning for future in a more realistic manner (Bhaerman & Spill, 1988; Sharf, 2002).

The matters of career awareness and employability are the joint problem of all the individuals living at the society whether handicapped or not. Various legal measures have been by the state with regard to the employment of the handicapped (Mevzuat/Regulations, 2003). However, despite of these measures, the placement of the handicapped in employment with regard to their profession where they make career appears to be considerably low and it becomes necessary for them to cope up with various problems at employment environments (Demir & Eliöz, 2016; Derican, 2010; Kaya, Özten Anay & Girgin, 2014; Erdiken, 2005; Erdiken, 2007). The handicapped experience various different problems according to their types and degrees of handicap in looking for a job, finding a job advertisement and working in job processes. The hearing-impaired individuals, however, struggle with various problems both in professional training and employment processes as a result of communication problems, experienced by them as a result of restriction in their languages (Erdiken, 2005; Erdiken, 2007; Kaya, Özten Anay & Girgin, 2014). The hearing-impaired individuals experience difficulties in reading and comprehending texts as a result of their reading-comprehending, writing problems and restricted vocabularies and lag behind from their equals in the education process (Schirmer, 2000). When the researches pertaining to the professional training of the hearing-impaired individuals, it is seen that the professional training has been effective when it is done by the provision of supports in accordance with the requirement and level of the handicapped (İstel, 2018; Karasu & Uzuner, 2018; Karasu, Uzuner & Beral, 2018; Karasu, 2011; Kaya, 2012; Schirmer, 2000; Uzuner, Girgin, Girgin, Erdiken, Karasu, Kaya, Cavkaytar & Tanrıdiler, 2011).

Higher Education Institution in the Hearing-Impaired Individuals: The School for the Handicapped (SfH)

The university education is a part of the professional training and occupies an important place in the career processes with relation to the selected profession. When the hearing-impaired individuals want to get university education in our country, they can get education in all universities, affiliated to the YÖK (Higher Education Council). However, it is necessary for the supports in conformity with their levels of disability to be provided. The “Regulation on the Handicapped Consultancy and Coordination of the Higher Education Institutions”, which was published and entered into force on August 14, 2010 at the Official Gazette having the issue number of 27672, was come in force in order to prepare required academic environment for the facilitation of education lives of handicapped students in higher education processes and ensure their full participation in their education process (YÖK, 2010). The “Handicapped Student Units”, put into force together with the related Regulation, conduct works in order to support the handicapped students in universities. The studies so made may be listed as the recognition of the handicapped students by each university within its structure and development of awareness for the handicapped student, requirement-determination works, planning the works to make the environment free of handicap and determination and solution of problems by organizing meetings with the handicapped students (Kalyon, 2012). However, it has not been put forth how these studies/works so made have affected the educational process of the handicapped individuals. Therefore, it is clear enough that the handicapped students the handicapped individuals especially requiring language support will face immense difficulties in their processes of continuing their educations at universities. Currently, there is one higher education institution, equipped with convenient environment and strategies for the hearing-impaired individuals. The School for the Handicapped of the Anadolu University has kept offering education since 1993 for the handicapped individuals. The SfH currently continues to offer education in four programs; two for undergraduate and another two for associate (two-year) degrees. An average number of 40 hearing-impaired young people graduate from the SfH for each year. The total number of the graduates of the SfH is 497 as of the end of the Spring Semester of 2018. The SfH is the first and only higher education institution in Turkey as of its specialist education cadre both in its field and special education field and at the programs, prepared in conformance to the hearing-impaired individuals.

The level of language skills of the hearing-impaired students are closely related to various number of factors such as type and degree of the hearing handicap and age of becoming a hearing handicapped person and special education, got in that respect. It is not possible to reach such information of the hearing-impaired students, placed in the undergraduate programs of the universities apart from the SfH. Therefore, the degree of hearing handicap and as a consequence, the language level of the hearing-impaired individuals, enrolled in the undergraduate programs, is not known. A great majority of the hearing-impaired students getting education in the SfH have advanced and highly advanced sensori-neural hearing handicap.

It is important to make the career awareness due to take place in their professional trainings in accordance with their language levels in order that the hearing-impaired individuals find place for them at the employment environments. In this respect, it is necessary to integrate the career awareness studies with courses in the professional training processes, support the same with applications and diversify with interdisciplinary studies (Karasu, 2011; Karasu, Uzuner & Beral, 2018; Kaya, 2012; Uzuner et al., 2011). Having knowledge what the

preliminary information for the career awareness of the hearing-impaired young persons, entitled to get university education, will illuminate the development/updating of the studies that are and will be made for the career awareness. It is thought that the findings that are obtained from the study will make contribution to the career awareness and making career planning of the hearing-impaired university students, integrity of the courses at the professional training programs, applications due to be made and diversification of the foregoing through interdisciplinary activities. The general objective of this research is the determination of perceptions of the university students with advanced and very advanced level of hearing-impaired beginning their undergraduate education processes, on the career and career planning. The research questions within the direction of this objective are as follows:

Of the young people, who are the advanced and very advanced level of hearing-impaired, coming from various education environments;

- a) What are the personal characteristics?
- b) What are the educational and SfH information?
- c) What is the preliminary information with relation to the career and career awareness?
- d) What is the career planning for the post-graduation period?

Method

The research where it is aimed to determine how the hearing impaired young persons, who came from different education environments, with the advanced and very advanced level of hearing-impaired, have come to the SfH and their opinions with relation to the career planning of them, is a descriptive analysis. According to this approach, the data, obtained within the research process, are summarized and interpreted within the themes, determined in advance. Direct quotations are given place at the descriptive analysis study in the reporting of the data, obtained at the end of an interview, questionnaire or observation in order to reflect the opinion of the individuals in a striking manner. The objective of the descriptive analysis is to submit the findings so obtained in a regulated and interpreted manner (Yıldırım & Şimşek, 2016).

The research data have been gathered with literature scanning, document scanning, observation, researcher diary, questionnaire process video shootings and questionnaire. The questionnaires are the scales, used for the obtainment of information for objective with the questions, asked to the group that is accepted to be representing a certain universe (Bal, 2001). Open- and closed-ended questions have taken place at the questionnaire, developed in the research.

Participants

The students and research team constitute the participants of the research. According to the official records in our country, only 1.518 out of a total number of 7.010.598 students taking place at the undergraduate and associate degree processes of the higher education as of 2017-2018 educational year, are the hearing-impaired (YÖK, 2018). It is seen hereunder that only 0,022 % of the number of students taking place at the undergraduate and associate programs are the hearing-impaired. It is indicated in the related reports that the number of students, who enrolled in the undergraduate programs in the educational year of 2017-2018, is 669.367 (YÖK, 2018). In this case, it is possible to say that there are an approximate number of 145 hearing-impaired individuals at the undergraduate programs according to the proportion so determined. The number of students, who enrolled in the undergraduate programs of the School for the Handicapped (SfH) of the Anadolu University in the educational year of 2017-2018, are 22. It is possible to say that an approximate proportion of 15 % of the hearing-impaired students, who newly enrolled in the undergraduate programs of universities, are studying at the SfH. The hearing-impaired information and degree of the remaining 123 students are unknown. In the meantime, there is no information on the language levels of these students available. In this case, it is possible to conclude that the students, enrolled in the SfH, represent the advanced and very advanced level of hearing-impaired students. In this context, 22 hearing-impaired students, who enrolled in the undergraduate programs of the SfH in the educational year of 2017-2018, constitute the universe of our research. A questionnaire has been applied to 16 (73 %) of these students having taken part in the research.

The research team consists of four instructors. The author of the article served duty as the conductor of the research. All instructors have taken place in the collection of data, their analysis and validity studies.

The research is limited by the 16 advanced and very advanced level of hearing-impaired students, for whom the data are gathered.

Data Collection Techniques and Analysis

The questionnaire that has been prepared in order to bring the opinions of hearing-impaired undergraduate students about the career and career awareness and to learn about the opinions of the students was applied to the undergraduate students, who newly began the SfH in the educational year of 2017-2018 at class environment. The questionnaire that has been prepared at the computer media and adopted to the language level of the handicapped students upon regulation was applied in three sessions on the dates of 03-06-07/11/2017. The questionnaire has been filled in at the class environment. While the questionnaires were answered at the class, the researchers responsible for the application of the questionnaire have taken place beside the students. No time limitation has been given for filling in the questionnaire. The questionnaire has been filled in with individual supports, given by the researchers to the students. The validity study of the questionnaire has been carried out by three academic members, experienced on research methods and specialists in the hearing-impaired individuals. A total number of 41 questions were taken place at the developed questionnaire where there were 25 closed-ended and 16 open-ended questions. The developed questionnaire contained the following topics: *“Personal Information”*, *“Information on Education and School for the Handicapped (SfH) of the Anadolu University”*, *“Acknowledge About –Associate-Definition of Career Conception”* and *“Looking for Employment/Job After Graduation, Finding Job Advertisement and Job Application”*.

The hearing-impaired students, who participated in the research, show a dispersion of 8 females (50 %) and 8 males (50 %) in consideration of sex. The students of the graphic 1st Class, Ceramic 1st Class and Preparatory class students in Turkish (language) have answered the questionnaire in different sessions. The descriptive analysis techniques have been used in the analysis of data, gathered in the direction of the questionnaire and prepared for the objective. Each section-taking place in the questionnaire has been analysed within itself.

The students have been informed about the content and application of the research in the questionnaire sessions and written permission letters were taken from the students. All of the students have participated in the research voluntarily. A camera record has been made after the collection of letters of permission. The questionnaire answering process has been jointly participated by an instructor, who knows sign language, and special training experts. A group and individual support study has been made for the comprehension of questions by the students in advance of answering the questionnaire.

Any question that is not understood and asked by a student for clarification was explained firstly to the student and then, to the class and by doing so, it was tried to ensure the equality. The video record of all questions so explained has been taken. It has been tried to make same explanations in all sessions. The problems and suggestions, experienced in the process are entered in the diary of the researcher (Figure 1).

Figure 1: Participant Students in the Questionnaire Session

Findings

The findings at this section of the research will be presented under the topic of the research questions. The questions of the questionnaire under the research questions and students' answers will be interpreted within the direction of the objectives and transmitted accordingly.

a) What are the Personal Characteristics of the Students Studying in the Undergraduate Programs of the SfiH?

Relevant questions on *demographic information, looking or a job and working in a job* take place at the “*Personal Information*” section of the questionnaire. There are a total number of 20 questions take place at this section.

Demographic Information

The average age of the students is 21. In this respect, 9 (56 %) of the students are enrolled in the Ceramic and 7 (44%) however, in the Graphic department. While 3 (19 %) of the students use cochlear implant, 13 (81 %) students, however, use hearing aid. While 9 (70 %) of the students wearing hearing aid uses their devices in a regular manner, the remaining students said that they do not wear their devices in a regular manner. When it is looked at the reasons of not wearing the devices, however, the information such as disturbed by noise, headache and failure to get sufficient training was given. 2 (13 %) students have not answered this question. The personal information of the students, participated in the research, take place at the Table 1.

The effect of having a hearing-impairment is a known fact on the skills of using the language (Kretschmer & Kretschmer, 1988). When the ages of the hearing-impairment ages of the students are taken into consideration, it has been understood that 10 (63 %) students are the hearing-impaired inborn, 3 (19 %) are at the age of 1, 2 (13 %) at the age of 8 and 1 student, however, at the age of 11. Within the light of these data, the ages of 13 (81 %) students when the hearing-impairment started have similar natures. It has been understood that 3 (19 %) students have become hearing- impaired after the language acquirement age. This circumstance shows that the language levels of these three students have been more developed and rich in comparison with the others. Showing a conspicuous difference of the answers of these students in comparison with others is an expected circumstance. When the hearing impairments of the students are classified, it has been understood that 13 (81 %) of the students are subject to very advanced, 2 (13 %) advanced level and 1 (6 %) student, however, at medium level hearing-impairment (WHO, 2018).

Table: 1 – Characteristics of the Participant Students

Department/Class	Student	The Cause of Hearing Loss /Age	Hearing Loss (dBHL)

Information on Looking for a Job and Working in a Job

There are 3 questions with relation to this topic: “*Did you look for a job before arrival in the school?*”, *If the*

answer is YES, please explain it. What have you done when looked for a job? Did you work before you came to the school? If the answer is YES, please say where you worked?

When the questionnaire data are examined, it has been determined that 8 (50 %) of the students were looking for a job and 8 (50 %), however, did not look for a job. The students, who looked for a job, were asked what they have done while looking for a job. Only 4 (26 %) of these students answered this question. 2 students said that they went to the İşkur (Turkish Employment Agency) and 1 student said that he gets support from his family and 1 student, however, the CV. The other students did not answer the question. It has been determined that the students, who have worked before he came to the school, were 9 (56 %).

b) What are the Educational and SfH Information of the Students Studying in the SfH Undergraduate Programs?

It has been understood in this section of the questionnaire where the questions for the educational information of the students take place that 11 students (69 %) have taken pre-school education and 5 (31 %), however, not taken the said pre-school education. It is seen that 9 (56 %) students have taken education at the “Day Special Education” and 1 student at the “Special Boarding School” and 5 (31 %) students, however, have taken education in the “Inclusion” environment. 1 (6 %) student did not answer this question. 2 (13 %) students, who have taken education at the day special education environment indicated that they passed to the inclusion environment. It is seen that at the secondary education processes, however, 10 (63 %) students have taken education at the Day Special Education” institution, and 2 (13 %) students at the “Special Boarding School” and 5 (31 %) students, however, have taken education in the “Inclusion” environment. 1 student did not answer this question (Figure 2).

Figure: 2 – Educational Background of the Students

The questions such as: “where did you learn about the School for the Handicapped (SfH)? Did you plan to come to this school? If yes, what did you do? And “What might you do if this school was not available? have taken place at the questionnaire in order to learn about the causes for the selection of the SfH for undergraduate education and whether the university education have taken place at their career planning and for undergraduate education with relation to the career awareness of the students.

The objective of the first question is to get information about the recognition of the SfH. According to the findings so found, the aim is to determine the environments where the recognition of the School for the Handicapped (SfH) and plan the studies. It is indicated in this question that more than one alternative may be ticked. When the answers are examined, it has been seen that 5 (31 %) students ticked that they have learned from the internet”, 3 (19 %) students “Guidance Research Units” and 15 other students, however, ticked as learned from “friend”. According to the data, the unit where the maximum number of data has been taken on were “friends” the SfH. In any meetings, conducted with the students after the questionnaire, it has been understood that the students had friends, graduated from the SfH or currently studying and they set up contact with them about the school. It has been seen that the rate of guidance of the hearing-impaired students by the Guidance Units taking place at the secondary education institutions to the university environments, especially to the SfH, have been considerably low. Within the lights of these data, it has been decided to carry out informative works with the personnel and managers serving duties at the Guidance Research Units taking place at the secondary education institutions and special education vocational high school having hearing-impaired students within their structure, and to take the trips for school introduction to the special education vocational high schools where the hearing-impaired students take place, on the agenda again.

The student ere asked *whether they have planned to come to the SfH in advance* in order to understand if an university education was available in their career planning targets or not. While 12 (75 %) of the students answered this question by “Yes”, 3 (19 %) gave the answer “No”, 1 student did not answer it. 12 students, who gave the answer “Yes”, were asked to write down what they have done in order to come to the SfH. 8 students among 12 have understood and replied the question why. The explanations, written down, by them were that they wanted to read university and their friends were studying as well and therefore, they wanted to come. A few examples to the answers of the students:

- I want to learn about the courses a lot.
- I want to attend in a school like university.
- I like graphic and art and work for it, I see them in order to find at Internet.
- I previously came and saw the Eskişehir University with my mother, father and sibling. I wanted to study at this school.

They were asked a question of “*What would you do if that school was not available?*” in order to understand that the hearing-impaired young persons had any plans to take education in another university if the SfH did not exist or continue their education. They were requested to give an open-ended answer. This question was answered by all students. 1 student said he didn’t know anything about it. 8 (50 %) students indicated that they would work, 5 (31 %) of them said that they would not study, 1 (2 %) would stay at home and 1 (2 %) however, study in another school. When the personal information of the student, who said that he would study in another school, it was understood that he became hearing-impaired at the age of 11 and was able to target an alternative apart from the SfH as a result of the fact that his communication skills were close to normal students. However, the other students did not have any plans of studying in another university apart from the SfH. This is clearly understood from the answers of the students:

- .. Comfortable at home.
- I worked at a job
- I would not study. I did not have any intention of studying in advance. I would be an officer through the KPSS (E- Public Personnel Selection Examination).
- If not available, there would be no intention to go to another school and develop communication.
- Very difficult for me because a normal school is not convenient for me. I would write a petition to the Ministry of National Education.

c) What Are the Preliminary Information Levels with relation to the “Career” and “Career Awareness”?

There are 6 questions in this section. 2 (33 %) of the questions were open-ended and 4 (67 %), however, as multiple-choice questions. 2 of the questions, prepared as multiple-choice, contain an explanation indicating that open-ended answers might be written in.

Question 28. “Do you know about the meaning of the word career? (Yes/No)

The first question was prepared as a kind of Yes/No question. There are 6 (38 %) “Yes” and 10 (63 %) “No” answers. According to the questionnaire data, it is seen that the knowledge of the students about the wording “career” is limited.

Question 29. If your answer is yes, “where do you know about the wording “career””? (You can click more than one choice)

The students, who gave the answer “Yes”, were asked to click where they knew about the career wording. It has been indicated that it would be possible to click more than one choices taking place at the question. The dispersion in the Figure 3 is seen when the answers are examined.

Based on the answers, it is understood that the internet media is an important means in the comprehension of the wording “career”. It is understood that the preliminary information with relation to the career is mostly acquired from the internet and school. 6 students answered the section “*Explain*” taking place in the choices of the question. When the said answers are examined, it is seen that 1 student made a proper career definition, 1 student answered it by using the answers of the next question and 1 student, however, wrote that he did not know about the answer and would make a search about it. The student, who gave the proper/correct answer indicated as follows: “Career means to determine the future in your life, and think about what kind of job, work and so on will be done.” It is seen how good he used the language in his said answer. The student, who gave the answer, has been a hearing-impaired at the age of 11. This matter clarifies that he comes forth as different from other students in respect of reading and comprehension skills.

Figure 3 – The Sources of Career Information of the Participants

Question 30. In your opinion, which of the following the career may be related to?

According to the questionnaire results, 10 (63 %) students have answered this question. The dispersion of the students having giving answers is seen at the Figure 4.

Figure 4 – Opinions of the Participants about the Question 30

Upon examination of answers, it is seen that 9 (90 %) students gave the answer of “with job/profession) and the answer “with shopping”, however, is ticked by 1 (10 %) student. Other choices have not been ticked. On the basis of this question, it is understood that the students could associate the wording career with the job/profession. It is understood from the answer of the student, who gave the answer “with shopping”, saying “Looking for a job with shopping, career is working.” That he confused the wording “career” with the wording of “cashier”.

Question 31. What does career mean in your opinion? Please write down.

The question is open-ended. The definition of the wording “career” is required to be written down. 10 (63 %) students have given answers to the question. 1 student among those, who answered, has given an answer by confusing the wording with the word “cashier”. Among the remaining 9 students; 3 (33 %) gave their answers as “job”, 2 (22 %) as “looking for a job”, 1 (11 %) “İŞKUR (Turkish Employment Agency)” and 1 (11 %), however, as “workplace”. It is seen when the answers are examined that only 2 students gave the correct answers to the question. The examples from the answers of the students are indicated as follows:

- It is something like the İşkur but I have no knowledge about it.
- For a person exercising a profession, desired by it.
- It means for work.
- Market queue the career working.

Question 32. "Do you have any knowledge about the Career Planning?" (Yes/No)

It is aimed in the question to understand whether the student has any knowledge about "Career Planning". Giving answer to the question as "Yes/No"; those having answered the question as "Yes" were expected to write an explanation with relation to the "career planning" at the explanation section. It is seen when the questionnaires were examined that 3 (19 %) students gave the answer as "Yes", 9 (56 %) as "No" and 4 (25 %) students, however, did not give any answer. 2 of 3 students, who gave the answer "Yes" written down information at the explanation section. It is seen that both of the students, who wrote down their answers, have written correct information. It is understood according to the data that 88 % of the students did not know about the wording "career planning". Furthermore, it is also understood that linguistic skills of the students, who gave correct answers to the question, are better than other students as a result of the fact that they had the hearing-impairment at the ages of 8 and 11. The answers were as follows:

- We plan our field, what we will do in future and in what job we will work.
- It means aiming better targets and achieving the targeted objective.

Question 33. Do you have any career planning? If yes, what is it?

The question has been prepared as open-ended. 7 (44 %) of 16 students having participated in the research answered the question. When the answers were examined, it has been seen that 4 students having given answer have written down the answer of "I don't know". Only 2 (13 %) students have written correct explanations to the question. The same students have answered the 32nd and 33rd questions correctly. The answers, given by the students are as follows:

- Yes, I have career planning too. I want to take an undergraduate study for four years at the university and become successful at the E-KPSS (E- Public Personnel Selection Examination) and to be a civil servant and on the other hand, a graphic designer. My field of interest for the current period is the graphic designing, photography and communication.
- Yes, I have career planning. I want to run my own business after getting experience in a corporate firm.

d) What Are the Career Plans for the Post-Graduation Period?

The questions pertaining to the career plans of the students take place at this section. There are 8 questions in this section. 5 of the questions were prepared as open-ended. 2 of them were multiple-choice and 1, however, "Yes/No" question. The multiple-choice questions have explanatory sections.

Question 34. What do you want to do when you complete/graduated from the school?

The aim of the question is to acquire information on the career plans of the students for the graduation. There are 5 choices at the question. Furthermore, a space is left where he can write his own answer as an alternative. It is indicated in this question that the students may tick more than one answer. All students answered this question (Figure 5). The alternative "I never thought about it" was not ticked.

Figure 5: Opinions of the Participants about their Career Plans

Only one student contributed to the question by adding an article to it. The student indicated that he could work in a municipality. When the answers of the students are examined, it will be seen that 88 % of the students ticked the choice of "I will participate in the E-KPSS (E- Public Personnel Selection Examination) and become a civil servant"

Question 35. How do you look for a job when you finish your school?

The question is prepared as a multiple-choice question. It is indicated that the students can tick more than one answer. The dispersion of the student's answers is seen at the Figure 6.

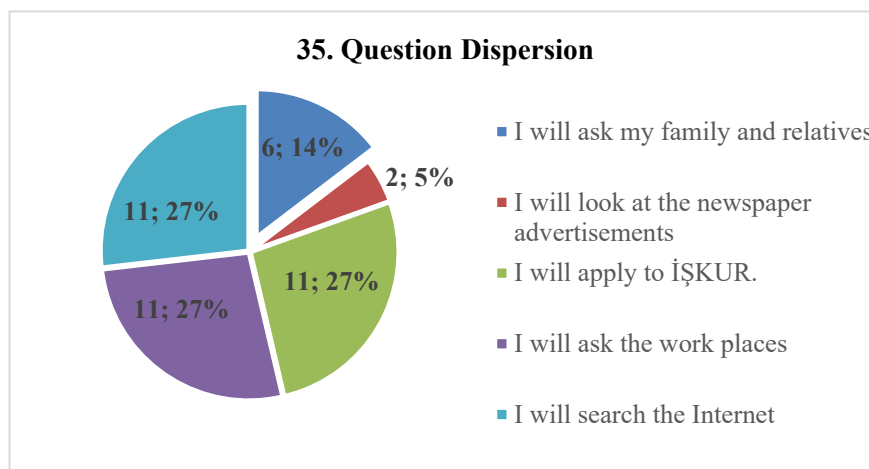

Figure 6: Opinions of the Participants about the method of Job Searching

It is seen according to the questionnaire data that the students ticked the choice of “*I will look at the newspaper advertisements*” with the lowest rate (2.5 %) to look for a job after their graduation. Within the direction of data, it is decided for seeking and finding a job to dwell at the courses with regard to the career awareness, conducted within the process of courses, upon the importance of job advertisements taking place at newspapers.

Question 36. Which documents are used in the job application?

The question is prepared as open-ended. All students answered the question. While 2 (13 %) of the students indicated that they did not know about it, 4 (25 %) students gave answers that are not related to the question. 2 (13 %) students said that they would get their diplomas and make job application, and 1 (6 %) student, however, said that his family might help him. The remaining 7 (44 %) students, however, gave correct answer by writing the names of documents such as CV, report and so on, correctly. Some of the answers of the students are as follows:

- Handicapped report or internship document school document training field document available.
- Diploma, health report, identity card photocopy, photograph and military service document.
- Curriculum Vitea – CV Recorded, signature
- Like the list, but I understood little.
- Diploma document to computer at the job application.

Question 37. What are done in a job interview?

The question, prepared as open-ended, was answered by 13 (81 %) students. 11 (69 %) students made the definitions of their employment experience or job interview. 2 students have given correct answer to the question. It is understood when the answers of the questionnaire are looked at that 80 % of the students have knowledge about job interview, 13 % of them experienced a job interview before and again, 13 % of the same could write the definition of the job interview. Some examples to the answers of the students are as follows:

- Do not speak like an interview, if we agreed upon, my family takes it.
- Talking about the job, then, how to look for job afterwards....?
- Interview and training are made.
- I made an application through internet and they called me a week later and we had an interview.

38. Question. What is a job application file?

The question was prepared as open-ended. The job application file is the file where necessary documents take place in during the job application. It is aimed to learn about what the file is and what is available in it. 10 (63 %) have given answer to the question. It is seen that 19 % of the students have answered the question correctly. Some of the answers of the students are as follows:

- All documents of the person identity card photocopy, photograph diploma. It is the file where documents such as military service are available.
- Something important necessary.
- I will give everything when the your form and list are brought it.

Question 39. What does a CV mean?

10 (63 %) of the students answered the question correctly. 6 (38 %) students did not answer or wrote down that it is not known to him. "The "Curriculum Vitae" answer is accepted as correct. Only 2 (13 %) students made a correct definition of CV in this question.

Question 40. Do you know about the "İŞKUR" (Turkish Employment Agency)? (Yes/No)

12 (75 %) students answered the question by "Yes" and 4 (25 %) students, however, by "No". It is understood from the data that 75 % of the undergraduate students had knowledge about the İŞKUR and could benefit from it after their graduation.

Question 41. What does the "İŞKUR" do?

The students are expected to give an open-ended answer to the question, prepared in order to learn about to what degree the students have knowledge about the İŞKUR. 12 (75 %) have answered the question. It has been understood that 10 (63 %) of the students could described the İŞKUR correctly and 2 students, however, mentioned about their own experiences.

Discussion and Conclusions

It is tried within the scope of the research to put forth the demographic information, SfH preferences, their opinions on the career and career awareness of 16 hearing-impaired students studying at the undergraduate programs of the School for the Handicapped (SfH) of the Anadolu University, located in Eskişehir province, according to the questionnaire questions, applied in this respect.

It has come forth within the direction of a descriptive analysis so made that;

- Those of hearing impaired students, who preferred the SfH and acquired the right of studying there were the advanced and very advanced level of hearing-impaired individuals;
- The hearing-impaired students regarded the SfH as an important, even further the only opportunity for the higher education process of their careers, and thought that they would not study or were going to work if the SfH was not available;
- The advanced and very advanced level of hearing-impaired students had knowledge about the SfH that have taken place in their career plans through their friends, and the Guidance Research Units remained at the background on the subject matter thereof;
- The hearing-impaired undergraduate students had limited knowledge with relation to their careers and career planning, and could not write answer(s) with relation to the concepts because of insufficiencies in their vocabulary, however, could manage to associate the career and career awareness with the job and profession.
- It is an important target for the bachelors to be graduated from the SfH to be successful at the E-KPSS (E-Public Personnel Selection Examination) and find a job at the public sector;
- They had knowledge about the CV that is one of the necessary and important documents for the job application, however, this knowledge was limited;
- They had limited knowledge about job interview; and
- The İŞKUR (Turkish Employment Agency) that is an important institution on the placement in job is known by the hearing-impaired undergraduate students.

It is understood according to the research results that the majority of the individuals studying at the SfH is consisted of the advanced and very advanced level of hearing-impaired individuals. The reading and comprehension problems of the advanced and very advanced level of hearing-impaired individuals come forth as an important obstacle in their educations at university level. Before all else, they experience difficulties to achieve necessary success points for placement in the related university programs. Various works have been carried out at the SfH for the hearing-impaired students in order to enable them to take place in university programs. One of these works is related to the student acceptance through preliminary enrolment and special talent. In 2013, a condition indicating "It is necessary to have at least one of the YGS (Transition to Higher Education Examination) be 100 or over, provided that the handicapped students (physically handicapped, visually-handicapped, hearing-impaired, autism) proved that they are handicapped, at the programs accepting students by a special talent examination" was added I the 2014 Student Selection and Placement Examination through the correspondences and catch-up works between the SfH and ÖSYM (Assessment Selection and Placement Centre) (OSYS, 2014). In the continuation of the decision, it was resolved in a meeting of the General Board of Higher Education on September 25, 2014 to make the enrolments of the students, who won the talent examination by the assessment according to the result of a separate talent examination between them without taking the YGS (Transition to Higher Education Examination) into consideration, to the programs taking the handicapped students through a special talent examination (OSYS, 2015). This case has speeded up both the flow of students to the School for the Handicapped (SfH) and facilitated

the placement of the handicapped individuals in the programs apart from the SfH. There has been sufficient number of student applications since 2014 to fill in the quotas of the undergraduate programs of the SfH. This circumstance is an important opportunity from the point of placement of the hearing-impaired students in the SfH that comes forth as an important opportunity for taking undergraduate education. However, the placement in the programs is not sufficient. It is necessary to evaluate the higher education processes well and to prepare and support environments for raising both profession and language experience knowledge of the students (Uzuner et al., 2011, Karasu, 2011; Karasu, 2017; Kaya, 2012; Kaya, Özten Anay & Girgin, 2014).

According to the result of the questionnaire, it is understood that the students at the undergraduate programs of the SfH prefer the SfH in order to get education at higher education level in the undergraduate programs of the SfH and they have no other studying plans at a different higher education institution. From the point of view of the higher education school that is sole institution in its field of engagement, this is an important opportunity for the higher education of the hearing-impaired students. However, it is necessary to open new higher education institutions in order to increase the hearing-impaired individuals taking place in the higher education and to make the educated individuals be acquired by the economy. In this context, the researches, made with relation to the teaching and teaching methods at the SfH will play a guiding role for the establishment of new departments.

The results of the questionnaire give some clues with relation to the career and career awareness of the hearing-impaired undergraduate students. However, there is a requirement for the diversification of data and method of research in order to put forth the problems and pertaining solutions. According to the results of the questionnaire, notwithstanding that the hearing-impaired students do not know about the meaning of the wording "career", it is seen that they could make correct estimations when the choices and clues are given. It is understood that the practice of employment or internship by some of the students in advance of the school give ideas for workplaces and recruitment. However, the permanence of this knowledge for the hearing-impaired students will be realized by the repetition of the same in various contexts and significant environments (Paul, 1998; Rupley, Blair & Nichols, 2009). It is possible to say that the studies, carried out with the final class students on the matters of raising the career awareness at the higher education school and learning about the techniques of applying for a job, provides an important source on this matter. It is understood to be necessary to make these studies, made within the lights of information being obtained from the questionnaire results, in previous classes as well.

The opinions of 88 % of the students, enrolled in the undergraduate programs of the SfH, about the placement in a job through E-KPSS (E- Public Personnel Selection Examination); it is sufficient for the students to find a job at the public sector and they have no willing to work in own their field of profession. It is very limited for the graduates of fine arts departments such as Graphic, Ceramic and so on, to find a job opportunity in their field at the public sector. Whereas there are lots of job opportunities at the private sector in these fields. However, as a result of lack of sufficient knowledge and experience of the hearing-impaired undergraduate students to look for job and find job advertisement, it is possible to say that they want to take part in the E-KPSS (E-Public Personnel Selection Examination) and place in a job immediately. Therefore, the studies to be made with the hearing-impaired students in this direction are important from the point of view of employability of them. Various positive developments are made at this stage through the studies, conducted at the Higher Education School.

It is understood as a consequence of the questionnaire results that the İŞKUR is known about by the hearing-impaired undergraduate students. However, it is necessary to teach the effective use of the İŞKUR in order to find a job.

The questionnaire results show that the diversification of activities for increasing the career development and employability such as looking for a job, finding job advertisement, application for a job, job interview, getting to know about the workplaces and so on, conducted at the SfH and keeping on making the same in lower classes will be beneficial and important.

Osmanlı Düşünce Tarihinde 12./18. Yüzyıl Veliyyüddin Cârullah Örneği

Murat ÇELİK

Doktora Öğr., Çukurova Ün. Sosyal Bilimler Enstitüsü Felsefe ve Din Bilimleri Anabilim Dalı

Tuna TUNAGÖZ

Dr. Öğr. Üyesi, Ç.Ü. İlahiyat Fakültesi İslam Felsefesi Anabilim Dalı

Özet

Bu bildiride, Osmanlı düşünce tarihinin 12./18. yüzyıldaki temsilcilerinden Veliyyüddin Cârullah (ö. 1151/1738) konu edilmiştir. Bildiride öncelikle Cârullah'ın hayatı hakkında özet bilgiler verdik. Ardından, Veliyyüddin Cârullah'ın yazdığı ve sahip olduğu kitapların kenarlarına düştüğü notlar vesilesiyle, onun ilgi alanlarına, ilmî kişiliğine ve âlim ve düşünür olarak temel özelliklerine temas ettik. Bu çalışmayla, özelde Veliyyüddin Cârullah, genelde son dönem Osmanlı düşüncesine dair henüz yetersiz durumdaki birikime mütevazı bir katkı sunmayı hedefledik.

Anahtar Sözcükler: *İslam Felsefesi, Osmanlı Düşüncesi, Mantık, Veliyyüddin Cârullah, Cihet-i Vahde.*

Not: Bu bildiri, Ç.Ü. BAP Koor. Birimi'nce desteklenen SDK-2018-10161 kodlu proje kapsamında sunulmuştur.

I. Hayatı ve İlmi Kişiliği

Osmanlı ilim ve düşünce tarihinin önemli simalarında birisi olan Veliyyüddin Cârullah, 1070/1659 yılında Tırhala vilayetinin Yenişehir kazasına (Larissa-Yunanistan) bağlı bir köyde doğdu. Doğduğu bölgedeki medreselerde okudu. Otuz iki yaşında Mekke'ye gidip yedi yıl kaldı ve bu sebeple "Cârullah" (*Allah'ın komşusu*) olarak anıldı. Mekke'den ayrıldıktan sonra Kudüs, Şam, Halep, Hama, Nablus ve Bağdat'a giderek çok sayıda âlimin derslerine katıldı. Nakşi, Kâdirî, Halvetî ve Bektâşî tarikatına bağlı şeyhlerden tasavvuf terbiyesi gördü. 1110/1698 yılında İstanbul'a geldi ve müderrisliğe başladı. Galata ve Edirne'de kadılık yaptı. Cemâziyelâhir 1151/Eylül 1738 tarihinde İstanbul'da vefat etti (Özcan, 2013: 38).

Veliyyüddin Cârullah, döneminin birçok ilim merkezini uzun bir süre dolaşmış ve gittiği yerlerde ulamanın derslerine katılmıştır. Gittiği yerlerdeki eserleri toplamış ve İstanbul'da bir kütüphane oluşturmuştur. Topladığı 3515 eser halen Süleymaniye Kütüphanesinde Cârullah Efendi bölümündedir. Cârullah'ın kendi eserleri mantık, tefsir, hadis, fıkıh, kelam, kıraat, meânî, tasavvuf, astronomi gibi çok geniş bir yelpazeye sahiptir. Özellikle mantık alanında birçok risale derlemiştir. Bu risaleler mantık ile ilgili mesela "cihet-i vahde" gibi önemli mevzuları da kapsamaktadır. Onun mümeyyiz vasıflarından biri de kütüphanesindeki kitaplara özellikle dönemindeki tartışmalı meseleler üzerinden düştüğü notlardır. Kısaca Cârullah, yaşadığı çağın epistemolojik ve ontolojik yaklaşımlarını, 17. ve 18. yüzyılların ilmî ilgi ve tartışmalarını, düşünce mirasımızın gün yüzüne henüz çıkmamız boyutlarını kavramada bizlere ışık tutacak önemli bir entelektüeldir.

Her ne kadar geç kalınmış olsa da bu önemli aydınımızla ilgili çalışmalar ortaya çıkmaktadır. Berat Açıl'ın editörlüğünde hazırlanan *Osmanlı Kitap Kültürü: Cârullah Efendi Kütüphanesi ve Derkenar Notları* adlı kitapta, Cârullah'ın kütüphanesinde kayıtlı ve kendisi tarafından okunan kitaplarındaki notları; İslâmî ilimler, aklı ilimler ile dil ve edebiyat ilimleri üç ana başlığı altında 14 ayrı çalışma içerisinde ele alınmıştır. Muhammed Uşame Onuş, "Bir Osmanlı Âlimi Cârullah Efendi'nin Terceme-i Hâli" adlı makalesinde kenar notları ve muhtelif kaynaklar üzerinden Cârullah Efendi'nin hayatını konu edinmiştir (Onuş, 2015: 19-51). Sami Arslan ise, "Eserden Müessire Seyr-u Sefer: Cârullah Efendi'nin Derkenar Notlarının Biyografisine Katkısı" adlı çalışmada, Cârullah Efendi'nin kütüphanesindeki sadece tasavvuf kitaplarının kenarlarına düştüğü Arapça notların satır aralarından yola çıkmış ve bu notların Cârullah Efendi biyografisine/otobiografisine dair söylediklerini göstermeye çalışmıştır.

Arslan, Cârullah'ın, Sadreddin el-Konevî'nin (ö. 673/1274) telif ettiği *Kitâbü'n-Nusûs*'un bir nüshasının zahriyesine aldığı iki not üzerinden şu sonuçlara ulaşmaktadır (Arslan, 2015: 70-72):

- (1) Cârullah Efendi 1151/1738 yılında hayattadır.
- (2) Adı Veliyyüddin; künyesi Ebû Abdullah; lakabı Cârullah'tır. Mekke'de, Cârullah lakabını almasını gerektirecek kadar uzun süre kalmıştır.
- (3) Fatih Camii'nin yanında bir vakıf kütüphanesi kurmuştur. Bu kütüphaneye tasavvuf sahasındakiler dâhil çok sayıda kitap vakfetmiştir.
- (4) Çok istemesine rağmen *Kitâbü'n-Nusûs*'un ikinci bir nüshasını henüz temin edememiştir. Bu durum, hayatının son dönemlerinde nispeten iktisadi sıkıntı içinde olduğu şeklinde yorumlanmaya müsaittir.
- (5) Vefat ettiği 1151 yılı ile genç yaşlarında yazdığı notlar arasında, yazı stili ve üslup açısından farklılık yoktur. Buradan hareketle, seksenli yaşlara ulaştığı 1151 yılında hâlâ dinç olduğu, elden ayakta düşünmediği söylenebilir.
- (6) Künyesini verdiği müellifleri, "muhakkik, fazıl, şeyh, allâme" gibi farklı sıfatlarla anarak, kendisinden önceki âlimleri sınıflandırmaktadır.

- (7) Edebî eserler kaleme alacak derecede Arapçaya vakıftır.
 (8) İlimlere ve kitaplara tutkuyla bağlı birisidir. Dikkatli, titiz ve sorgulayan bir okurdur. Elden geldiğince kitapları farklı nüshalarından okumakta; nüshaların kenarlarına metni tashih eden ve muhtevasını tenkit eden notlar düşmektedir.

Bunlarla birlikte, Cârullah Efendi'nin kütüphanesinde bulunan yazma eserlerdeki temellük kayıtlarından hangi tarihte nerede olduğuna dair bazı bilgilere ulaşılmıştır. Buna göre, Hicrî 1100'de Mekke'de; 1103'de Medine'de; 1104'te Mekke'de; 1106'da Kudüs'te; 1107'de Şam'da; 1110 ve 1111'de Bağdat'ta; 1112'de Halep'te, 1114'te Konya'da ve tekrar Halep'te; 1116-1119 yıllarında Şam'da; 1120, 1126, 1135, 1138 ve 1140'ta İstanbul'da; 1143'de kadı olarak Halep'te, 1147'de İstanbul'da, 1150'de sürgün olarak Gümülüne'de; 1150'de Edirne'de, 1151'de İstanbul'da bulunmuştur (Arslan, 2015: 74-76).

Elyazmaların kenarlarına düştüğü notlarda yer yer kişisel hayatının perdelerini aralayan Cârullah, bazen arkadaşlarından ve karşılaştığı hâdiselerden de bahsetmektedir. Mesela, “muhakkik ulemanın önde gelenlerindendir” dediği sûfi Şeyh Sa'deddin el-Hamevî ile Beytül-Makdis ve Şam'da zaman geçirmiştir. Bir başka kayda göre, “mel'ûn ve maktûl” kethüdanın düşmanlığının akabinde zalim vezir tarafından Gümülüne'ye sürülmüştür. Bu sürgün esnasında veya öncesinde Edirne'de kadılık yapmıştır (Arslan, 2015: 78).

Osmanlı tarihi kaynaklarında bireylerin kendileriyle ilgili anlatılarının bulunmadığı kabulünü sorguladığı (ve bunun böyle olmadığını gösterdiği) çalışmasında Cemal Kafadar, “el yazmaları arasında sürdürülecek sistematik araştırmaların daha nice hatırat, rüya defteri, otobiyografi, esaret anısı ve şahsi mektup örneğini ortaya çıkaracağını” belirtmektedir (Kafadar, 2009: 70). Bu konuda haklı olduğunu bir kez daha teyit etmek gerekir.

II. Kütüphanesindeki Eserler

İSAM veri tabanına göre, Süleymaniye Kütüphanesi Cârullah Efendi koleksiyonunda 3515 eser bulunmaktadır. Bu eserlerden bir kısmı aynı eserin farklı nüshalarıdır. Bunlardan 646 tanesi de risale şeklinde yazılmış eserlerden oluşmaktadır. Farklı ilim dallarından farklı eserler zengin bir ilim ve fikir dünyasına sahip olduğunu göstermektedir. Kütüphanesinde bulunan farklı ilim dallarına göre eserlerin sayısal dağılımı şu şekildedir:

<i>İlim Dalı</i>	<i>Eser Sayısı</i>	<i>İlim Dalı</i>	<i>Eser Sayısı</i>
Tasavvuf	374	Matematik	58
Kelam	365	Felsefe	56
Hadis	288	İslam Ahlakı	54
Mantık	257	Kimya	37
Edebiyat	250	Metafizik	36
Arap dili	224	Biyografi	35
Tefsir	199	Tarih	25
Fıkıh	195	Tıp	24
Hanefî Fıkıhı	183	Külliyyatlar	20
Psikoloji	149	Ferâiz	15
Kuran İlimleri	97	Siyer	14
Fıkıh Usulü	95	İslam Tarihi	14
Astronomi	71	Coğrafya	7

Tablo 1. Cârullah'ın kütüphanesindeki kitapların konularına göre dağılımı

III. Cârullah'ın Okuduğu Kitaplar Üzerindeki Notlar

Tuba Nur Saraçoğlu, “Kitap ve Sahibü'l-Kütüp: Cârullah Efendi'nin Siyer ve Tarih Kitapları” başlıklı çalışmasında Cârullah Efendi'nin zikredilen önemli notlarına dair bazı açıklamalar yapmaktadır. Ona göre, Cârullah Efendi'nin koleksiyonundaki notları kütüphane ve bilgi notları şeklinde sınıflandırmak mümkündür. Kütüphane notlarında iki tür bilgi yer alır: Birincisi, mülkiyet kayıtları ve esere dair bilgileri kapsayan kısa notlardır. İkincisi ise, yeri geldikçe konuyla alakalı gördüğü eserlerin kendi kütüphanesinde olduğunu belirten ifadelerdir. Koleksiyonun bilgi notlarında ise eserlerin ve müelliflerin isimleri, vefat tarihlerine yönelik tashihler, nesep bilgileri ve çeşitli eserlere atıflar yer almaktadır. Bu notlar Cârullah Efendi'nin ilmi birikimini ortaya çıkardığı gibi, okuyucular için kolaylık sağlayan bilgilerdir (Saraçoğlu, 2015: 265).

Cârullah Efendi'nin bilgi notları arasında araştırmalarına dair ipuçları da yer almaktadır: Mesela, Feridüddin el-Attar'ın (ö. 618/1221) *Tezkiretü'l-Evliyâ*'sında geçen bir hikâyenin kaynaklarını açıklarken Sadreddin el-Konevî'nin (ö. 673/1274) Nasîrüddin et-Tûsî'ye (ö. 672/1274) gönderdiği bir risaleden bahsetmektedir. Hz. Yusuf'un yaşı ile ilgili olarak *Teyşîr* isimli -muhtemelen Kâfiyeci'ye (ö. 879/1474) ait olan- eserde bu bilgiyi bulduğunu söylemektedir. Ebü'l-Hüseyn el-Kudurî (ö. 428/1037), Sa'deddin et-Teftazânî (ö. 792/1390) ve Seyyid Şerif el-Cürçânî'nin (ö. 816/1413) eserlerine yazılan şerhlere özellikle dikkat çekmektedir. Hanefî mezhebine mensup bir kadı olarak Hanefî fıkıhına ve fakihlerine çokça atıf yapmıştır. Hanefî fakihlerinin biyografileri konusunda da

oldukça hassastır (Saraçoğlu, 2015: 273-274). Hanefî usulüne dair Ebû Zeyd ed-Debûsî'nin (ö. 430/1039) veya Ebû'l-Yüsr el-Pezdevî'nin (ö. 493/1100) değil, Şemsü'l-Eimme es-Serahsî'nin (ö. 483/1090 [?]) eserini en güzel eser olarak nitelemiştir (Köksal, 2015: 115).

Notları arasında, mütalaa ettiği eserlere dair önemli bilgiler bulmak mümkündür. Bazı notlarda yalnızca eseri mütalaa ettiğini söyler, bazılarında çokça istifade ettiğini ekler, bazılarında ise hangi nüshayı mütalaa ettiğini belirtir. Mekke ve Medine'de iken okuduğu kitaplarda, mütalaanın bu yerlerde yapıldığını özellikle vurgulamıştır. İncelediği kitabın hacmini ve muhtevasını belirlemiştir; eser kendi kütüphanesinde ise mutlaka bunun kaydını düşmüştür. Aşağıdaki örnekte onun yaklaşımını açıkça görmek mümkündür (Saraçoğlu, 2015: 274-275):

Muhakkik Tûsî, Risale-i 'de Allah'ın külliyyat ve cüziyyatı alâ vechin külliyyin bildiğini kaydetmektedir. Yani Allah'ın cüz'îyyatı bilmesi bizimkinin aksine havâs ile değildir. Hakîm eş-Şehrîstânî el-Milel ve'n-nihâl isimli eserinde şöyle demektedir: Aristoteles âlemin hudûsuna kâildir; buna mukabil bir takım şüpheler ileri süren hukemadan bazıları âlemin kadim olduğu fikrini ileri sürdüler. Daha sonra gelenler de mezkûr şüphelerin âlemin kîdemine delil olduğunu zannettiler. Hâlbuki durum böyle değildir. Muhakkik Taftazani Şerhu'l-makâsîd'da birinci cevaba; Muhakkik el-Kutb Muhâkemâtu Şerhi'l-İşârât'ta ikincisine; Şeyh Şa'rânî de Risale-i Müfredde'de üçüncü cevaba işaret etmiştir. Ben bu son risaleyi 1100/1688-9 yılında Mekke-i Mükerreme'de bulunduğum sırada mütalaa etmiştim. Daha geniş tafsilat isteyen mezkûr kitaba bakabilir.

IV. Kendi Yazdığı Başlıca Eserler

1. *Hâşiye alâ Hâşiyeti'l-İsâm li-Şerhi'l-Akaidi'n-Neseftiyye.*
2. *Hâşiye alâ Şerhi'l-Bircendî fî İlmi'l-Hey'e.*
3. *es-Seb'u's-Seyyâretü'n-Nûriyye alâ Hâşiyeti'l-Fevâidi'l-Fenâriyye li-İsâgucî*
4. *Hâşiye alâ Hâşiyeti Muhyiddîn alâ Şerhi Hüsâmiddîn el-Kâtî alâ İsâgücî.*
5. *Ta'lîka alâ Şerhi'l-Hanefiyye ve Hâşiyeti Mîr Ebi'l-Feth.*
6. *Hâşiye alâ Şerhi'l-Makasîd li-Teftâzânî.*
7. *el-Fevâidü'n-Nûriyye ale'l-Âdâbi'l-Hüseyniyye.*
8. *Hâşiye alâ Şerhi'l-Âdâb li-Taşköprizâde*
9. *Şerhu Âdâbi'l-Birgivi.*
10. *Hâşiye alâ Şerhi Hikmeti'l-Ayn.*
11. *Hâşiye alâ Şerhi Ciheti'l-Vahde.*
12. *Mecmûatü'l-Havâşî ale'l-İşârât.*
13. *Şerhu'l-Âdâb li-Sinâniddîn el-Kencî*
14. *el-Furkân fî Kırâati'l-Kur'ân.*
15. *Hâşiye alâ Şerhi Âdâbi'l-Mes'ûdî.*
16. *Hâşiye alâ Şerhi'l-Hidâye fî'l-Hikme li-Kâdî Mîr*
17. *Hâşiye alâ Hâşiyeti'l-İsâm alâ Tefsîri'l-Beyzâvî.*
18. *Hâşiye alâ Şerhi Âdâbi'l-Birgivi li-Kazâbâdî li-Cârillâh* (bkz. Özcan, 2013: 38-40).

Sonuç olarak döneminin ilmî tartışmalarını ve külliyyatını anlamak açısından Velîyüddin Cârullah'ın kütüphanesinde bulunan, özellikle fıkıh, fıkıh usulü, kelam, felsefe, mantık ve tasavvuf eserleri dipnotlarıyla birlikte daha detaylı olarak incelenmelidir.

Özet

Bu araştırma öğretmen adaylarının empati düzeylerini belirlemek amacı ile gerçekleştirilmiştir. Tarama modellerinden ilişkisel tarama modeline göre gerçekleştirilen bir araştırmadır. İstanbul Üniversitesi Hasan Ali Yücel Eğitim Fakültesi'nin Psikolojik Danışma ve Rehberlik ile Türkçe öğretmenliğinin 1. ve 4. Sınıflarında 2018 bahar döneminde öğrenim gören öğrenciler örnekleme dâhil edilmiştir. Örneklem amaçlı örnekleme yöntemlerinden olan tipik örnekleme yöntemine göre belirlenmiştir. Veriler Bora ve Baysan-Arabacı (2009) tarafından Türkçeye uyarlanan Cambridge Davranış Ölçeği kullanılarak toplanmıştır. Veriler SPSS programına aktarılmış ve betimsel istatistikler ile bağımsız gruplar için t-testi istatistiksel işlemleri gerçekleştirilmiştir. toplam 147 öğretmen adayından elde edilen bulgulara göre Psikolojik Danışmanlık ve Rehberlik bölümünde öğrenim gören öğretmen adayları ile Türkçe Öğretmenliği bölümünde öğrenim gören öğretmen adaylarının genel empati düzeyleri puanları arasında anlamlı bir fark bulunamamıştır. Ayrıca kızların ve erkeklerin empati düzeyleri puanları arasında da anlamlı bir fark söz konusu değildir. Son olarak dördüncü sınıfta öğrenim gören öğretmen adayları ile birinci sınıftaki öğretmen adaylarının empatik yönelimleri arasında anlamlı bir fark bulunmamasına rağmen dördüncü sınıf öğrencilerinin empatik yönelim tutum puanlarının biraz daha yüksek olduğu belirlenmiştir. Dördüncü sınıfların Bilişsel Empati, Empatik İlgi-Sempati ve Sosyal Yeti düzeylerinde daha yüksek bir puana sahip olması bu düzeylerin eğitim yoluyla kazandırılabilirliğini göstermektedir.

Anahtar Kelimeler: *Empati, öğretmen adayları, Empati Düzeyi*

Giriş

Empati bencil olan ve kendi çıkarlarının peşinden koşan insanların arttığı, para ve güç üzerine odaklandığı, savunmasız insanların görmezlikten geldiği dünyada insanın kendisini başkasının yerine koyarak ona ilgi, anlayış ve sevecenlik gösterebilmesidir (Tekinalp 2014). Empatide esas olan karşımızdaki kişinin duygu ve düşüncelerini anlamaktır. Empati kurarken karşımızdaki kişiyle aynı duygu ve düşünceleri paylaşmak zorunda değildir (Dökmen 2004).

Dökmen'e (2004) göre karşımızdaki bir insana empatik tepki vermenin iki yolu bulunmaktadır. Bunlar yüzümüzü, bedenimizi kullanarak onu anladığımızı ifade etmek ve sözlü olarak onu anladığımızı dile getirmektir. Yine Dökmen (2004) bir kişinin karşısındakıyla empati kurabilmesi için gerekli olanları şöyle sıralamaktadır:

- Empati kuracak olan kişi kendisini karşısındakinin yerine koymalı ve olaylara onun gözüyle bakmalıdır. Ancak empati kurduktan sonra kişi girdiği rolden çıkıp kendi yerine geçmelidir. Eğer bunu gerçekleştirmez ise empati kurmuş olmaz.
- Empati kurmuş sayılmak için karşımızdaki kişinin duygu ve düşüncelerini doğru anlamamız gerekir.
- Empati kuranın zihnindeki empatik anlayışı karşıdaki kişiye iletilmesi gerekir.

Tekinalp'e (2014) göre empatik davranma, eğitimi ve olgun olmayı gerekli kılar ve empatik davranış, 3 aşamada gerçekleşir (Tekinalp, 2014: 42):

1. Bilişsel aşama: Kişinin kendisini karşısındakinin yerine koyarak onun ne düşündüğünü anlamaya çalışması.

2. Duygusal aşama: Başkasının bir olay hakkında ne hissettiğini hissetmeye çalışmak
3. Aktarma: Bir insanın karşısındaki kişiye ilk iki aşamayla zihninde meydana gelen empatik kavrayışı aktarması.

Empatide bencilliğe yer yoktur. Bencil insan, karşısındaki kişinin düşüncelerini, hislerini anlayamaz bu nedenle empatik bir davranış gösteremez (Tekinalp, 2014, s. 42). Bencil olan, başka bir ifade ile benmerkezci bir kişinin empati kurması mümkün değildir. Başka kültürlerin nasıl bizim gibi düşünmediklerine şaşırıyorsa veya bizim önemsiz gördüğümüz bir olaya karşımızdakinin üzüldüğünü görünce bu durumu yadırgıyorsak ise benmerkezci bir özelliğe sahibiz demektir. Empati kurabilmek için ön şart benmerkezcilikten kurtulmaktır (Dökmen, 2004).

Başkaları tarafından anlaşılıp önem verilmek kişiyi rahatlatır ve iyi hissettirir. Başkasıyla empati kuranların bu durumdan sağladıkları kişisel kazanç, ruhsal yönden gelişmek olabilir. Eğer kişi başka insanların iç dünyasına girebiliyor ve empati kurabiliyor ise bu insanın iç dünyası da zamanla zenginleşecektir. Empati, empatiyi kuran için de önemlidir. Yardım sever ve empatik becerileri yüksek olan kişilerin çevreleri tarafından sevilme, (Dökmen, 2004: 158), beğenilme ve takdir edilme ihtimalleri yüksektir.

Öğretmenlik mesleği kişiler arası iletişime dayanan mesleklerden birisidir. Kişilerin aralarında doğru bir iletişimin kurulabilmesinde empati önemli bir yere sahip olduğuna göre öğretmenlerin empati kurabilme becerisine sahip olması oldukça önemlidir (Şahin ve Ünüvar, 2011). İyi bir öğretmende mesleki ve kişisel olmak üzere bulunması gereken bir takım nitelikler vardır. Başka bir ifade ile iyi bir öğretmenin sadece akademik becerilere sahip olması yeterli değildir. Öğretmenlerde bulunması gereken kişisel özellikler arasında, hoşgörülü, sabırlı, anlayışlı olma başta olmak üzere öğrencilerinin sosyal ve duygusal yönden gereksinimlerini belirleyebilecek ve bu gereksinimleri giderebilecek yeterliliğe de sahip olması gerekir. Pala'ya (2008) göre öğrencilerinin hislerini ve bakış açılarını anlayabilen öğretmenler, onların ihtiyaçlarını anlar ve bunu karşılamak için çabalarlar. Bunun sonucunda öğrenciler öğrenmeye ve paylaşmaya yoğunlaşabilirler. Duygusal yakınlık, öğretmenin öğrenmeyi artırıcı veya kısıtlayıcı faktörlerinin keşfini sağlar. Bundan dolayı öğretmenlerin kişilik özellikleriyle birlikte empati kurma becerisine sahip olması büyük önem taşımaktadır. Bu da beraberinde öğretmenlerin öğrencileriyle iyi bir şekilde iletişim kurmasına, öğretme konusunda becerilerine, sınıf ortamının olumlu olmasına katkıda bulunur (Şahin ve Ünüvar, 2011).

İnsanlar arası ilişkide ve bireyin yaşam doyumunu artırmada önemli iki değişken olan empati ve olumlu sosyal davranışları ilişkilendiren çokça araştırma yapılmıştır. Acun-Kapıkıran, Kapıkıran ve Başaran (2010) PDR öğrencilerinin algılanan anne ve baba olumlu sosyal davranışları ile empatik eğilimleri arasındaki ilişki ile cinsiyetin buna etkisini incelemişlerdir. Acun-Kapıkıran, Kapıkıran ve Başaran (2010) yaptıkları çalışmada PDR öğrencilerin empatik eğilimleri, algıladıkları anne ve baba olumlu sosyal davranışlarından etkilendiğini bulmuşlardır. Annelerin olumlu sosyal davranışları empatik eğilimin önemli bir unsuru olurken, babaların duyguların açıklaması empatik eğilim için önem taşımaktadır. Ayrıca babaları tarafından duygularını açıkladığı şekilde algılayan erkeklerin empatik eğilimlerinin daha da arttığını bulmuşlardır. Empatik davranışları yüksek olan kızların olumlu sosyal davranışlarının da yüksek olmasıyla birlikte Psikolojik Danışma ve Rehberlik çalışanlarının mesleğinin gereği olarak, daha empatik olmaları ve daha olumlu sosyal davranışta bulunması beklenir. Bir bireyin empatik eğilim ve becerilere sahip olması, yardım etme davranışını ortaya çıkarmada önemli bir faktördür (Acun-Kapıkıran ve ark., 2010).

Pala (2008)'nın yapmış olduğu çalışmalara göre öğrencilerin empati kurma becerisi, ekonomik düzeylere göre farklılık göstermektedir. Ekonomik durumu iyi olan öğrencilerin empati kurma becerisi, ekonomik durumu kötü olan öğrencilere göre daha yüksektir.

Araştırmanın Amacı

Öğretmen adaylarının empati düzeylerini belirleyerek, empati düzeylerinin çeşitli değişkenlere göre farklılık gösterip göstermediğini belirlemektedir.

Alt Problemler

1. Öğretmen adaylarının empati düzeyi nedir?
2. Öğretmen adaylarının empati düzeyi,
 - a. Cinsiyete göre,
 - b. İlk ve son sınıfta olmalarına göre,
 - c. Branşlarına göre farklılık göstermekte midir?

Araştırmanın Önemi

İnsanların davranışlarının altında yatan nedenleri anlayabilmek için empati kurmak önemli olduğuna göre öğretmenlik mesleğini icra eden kişilerin de öğrencilerini anlayabilmelerinde, sorunlarını belirleyebilmelerinde ve sorunlarına çözüm yolları bulabilmelerinde empati kurma becerisine sahip olmaları son derece önemlidir. Eğitim sürecinde öğretmen adaylarına bu beceriyi kazandırmaya çalışmak gelecek yıllarda göreve başladıklarında çok daha başarılı olmalarını sağlayacaktır. Bunun içindir ki öğretmen adaylarının empati kurma becerisine eğitim fakültelerinin ne kadar katkı sağladığını belirlemek gerekir. Bu araştırma eğitim fakültelerinde öğrenim gören öğretmen adaylarının empati kurma becerilerine ne derece sahip olduğunu belirleyerek gerekli önlemlerin alınması için önerilere yer verilmiş olması açısından önemlidir.

Sınırlılıklar

Bu araştırma 2017-2018 öğretim yılında bir devlet üniversitesinin eğitim fakültesinde öğrenim gören Psikolojik Danışma ve Rehberlik Anabilim Dalı'ndaki ve Türkçe Öğretmenliği Anabilim Dalı'ndaki öğretmen adaylarıyla sınırlıdır.

YÖNTEM

Araştırmanın Modeli

Bu araştırma genel tarama modelleri arasında yer alan ilişkisel tarama modeline göre yapılmıştır. Genel tarama modeli çok sayıda elemandan oluşan evrende evren hakkında genel bir bilgiye ulaşmak için evrenin tümü veya içerisinden alınan bir grup örneklem veya örnek üzerinde yapılır.

Evren ve Örneklem

Bu araştırmanın evrenini 2017-2018 öğretim yılında İstanbul Üniversitesi Hasan Ali Yücel Eğitim Fakültesi'nde öğrenim gören öğretmen adayları oluşturmaktadır. Bu araştırmanın örneklemini İstanbul Üniversitesi Hasan Ali Yücel Eğitim Fakültesi Fakültesi'ndeki PDR ve Türkçe Öğretmenliği birinci ve dördüncü sınıf öğretmen adaylarından oluşturmuştur. Örneklem amaçlı örnekleme yöntemlerinden tipik örnekleme yöntemine göre yapılmıştır. Bu örnekleme yöntemine göre Psikolojik Danışma ve Rehberlik ve Türkçe Öğretmenliği Anabilim dallarında öğrenim gören 1. ve 4. Sınıf öğrencilerinden araştırmanın örneklemini oluşturulmuştur.

Veri Toplama Araçları

Bu çalışmada veri toplama aracı olarak Bora ve Baysan-Arabacı (2009) tarafından Türkçeye uyarlanan Cambridge Davranış Ölçeği kullanılmıştır. Orijinali üç alt boyut ve kırk maddeden oluşan Empati Ölçeği, Türkçe'ye uyarlandığında dört alt boyut ve yirmi altı madde olarak geçerli ve güvenilir bulunmuştur. Dört alt boyut; (1) bilişsel empati, (2) empatik-ilgi-sempati (duygusal empati), (3) emosyonel yanıt (duygusal empati) ve (4) sosyal yetidir. Bilişsel Empati boyutunu 19, 22, 25, 26, 36, 41, 43, 44, 52, 54 ve 55. Maddeler; Empatik İlgi-Sempati boyutunu, 10, 15, 27, 29, 34, 46 ve 48. Maddeler; Emosyonel Yanıt boyutunu, 32, 38, 42, 50 ve 59. maddeler ve Sosyal Yeti boyutunu, 8, 35 ve 57. Maddeler ölçmektedir. 4'lü likert tipi olarak hazırlanmış olan ölçekte ters madde bulunmamaktadır. Ölçeğin değerlendirilmesi ise "Kesinlikle katılıyorum" 2 puan, "Sıklıkla katılıyorum" 1 puan, "Bazen katılıyorum" 0 puan, "Kesinlikle katılmıyorum" 0 puan şeklindedir. Ölçekten elde edilecek en yüksek puan "80" en düşük puan "0"dır. Yüksek puan empati düzeyinin iyi olduğunu göstermektedir. Empati Ölçeğinin iç tutarlılığı oldukça yüksek bulunmuştur ($\alpha = 0.84$). Split half yöntemi ile elde edilen Guttman split-half katsayısı 0.78 olarak bulunmuştur. Cronbach alfa katsayısı ölçeğin ilk yarısı için 0.75, ikinci yarısı için 0.74 olarak bulunmuştur. Ölçeğin kısa formu için seçilen 22 sorunun Cronbach alfa değeri 0.814 olarak bulunmuştur. Ölçeğin test-tekrar test korelasyonu $r = 0.76$ olarak bulunmuştur. Kısa formundaki sorular için ise $r = 0.72$ 'dir.

Verilerin Toplanması ve Analizi

Ölçek gerekli izinler alındıktan sonra ilk olarak PDR birinci ve dördüncü sınıf öğrencilerine; bir gün sonra ise Türkçe Öğretmenliği birinci ve dördüncü sınıf öğrencilerine ders öncesinde verilerek ders başlamadan doldurtulmuştur. Ölçek yüz yetmiş kişiye uygulanmıştır. Yüz yetmiş veriden yirmi üç tanesi eksik ve yanlış doldurulduğu için işleme alınmamıştır. Yüz kırk yedi ölçek veri analizine dâhil edilmiştir. Öncelikle frekans tablosu alınmış ve betimsel istatistikler yapılmıştır. İki bağımsız değişkene ait ortalamaların karşılaştırılması için "bağımsız gruplar için t-testi" analiz tekniği kullanılmıştır. $P < 0,05$ anlamlılık düzeyi aranmıştır.

Bulgular

Örnekleme yer alan öğretmen adaylarının demografik özellikleri aşağıdaki gibidir:

Tablo 1: Öğretmen Adaylarının Demografik Özelliklerine Ait Bulgular

Özellikler	N	%
Cinsiyet	Kadın	115
	Erkek	32
	Toplam	147
Sınıf	1. Sınıf	78
	4. Sınıf	69
	Toplam	147
Bölüm	PDR	91
	Türkçe Öğretmenliği	56
	Toplam	147

Tablo 1’de görüldüğü üzere örnekleme yer alan 147 öğretmen adayının “%78,2’si” kadın, “%21,8’i” erkektir. Öğretmen adaylarının “%61,9’u” Psikolojik Danışmanlık ve Rehberlik (PDR), “38,1’i” de Türkçe Öğretmenliğinde öğrenim görmektedir. Sınıflara göre incelendiğinde ise 1. sınıfta okuyanların oranı “%53,1”, 4. sınıfta okuyanların oranı “%46,9’dur.”

Birinci Alt Probleme Ait Bulgular**Tablo 2: Öğretmen Adaylarının Empatik Yönelimlerine Ait Betimsel İstatistikler**

Değişkenler	N	Puan	ss
Bilişsel Empati	147	12,742	5,094
Empatik ilgi-Sempati	147	1,4218	2,16740
Emosyonel Yanıt	147	4,9932	1,27406
Sosyal Yeti	147	1,6259	1,17748
Genel	147	20,7823	6,38869

Öğretmen adaylarının empatik yönelimlerine ilişkin dört alt boyut Tablo 2’de verilmiştir. 147 öğretmen adayından elde edilen verilere göre “bilişsel empati” düzeyine ilişkin puanlara bakıldığında alınabilecek en yüksek puan ($2 \times 11 = 22$) dikkate alındığında ortalamanın biraz üstünde olduğu söylenebilir. Ölçeğin bir alt boyutu olan “Empatik ilgi-sempati” düzeyinin alt sınırdan bulunduğunu söyleyebiliriz ($7 \times 2 = 14$ puan- en yüksek değer). Emosyonel yanıtın ortalama bir değere çokça yaklaştığını söyleyebiliriz. ($5 \times 2 = 10$ puan- en yüksek değer) Sosyal yetinin çok düşük bir sınırdan yer aldığını söyleyebiliriz. ($3 \times 2 = 6$ puan- en yüksek değer) Genel puanlamaya bakacak olursak yirmi altı maddeye göre ortalamanın altında bir değer aldığı görülmektedir ($26 \times 2 = 52$ puan- en yüksek değer).

İkinci Alt Probleme ait bulgular**a) Cinsiyete göre****Tablo 3: Öğretmen Adaylarının Cinsiyetlerine göre Empatik Yönelimlerine Ait T-Testi Sonuçları**

Bağımsız Değişken	N	Puan	ss.	t	df	P
Bilişsel Empati	Kız	115	13,026	4,839	1,287	145 ,200
	Erkek	32	11,719	5,893		
Empatik İlgi-Sempati	Kız	115	1,357	2,177	-,691	145 ,491
	Erkek	32	1,656	2,149		
Emosyonel Yanıt	Kız	115	5,009	1,188	,279	145 ,781
	Erkek	32	4,938	1,564		
Sosyal Yeti	Kız	115	1,626	1,151	,005	145 ,996

GENEL	Erkek	32	1,625	1,289	,845	145	,400
	Kız	115	21,017	5,846			
	Erkek	32	19,938	8,100			

Öğretmen adaylarının empati düzeyleri cinsiyete göre incelendiğinde, Tablo 3'teki t-testi sonuçlarında " $p<0,05$ " düzeyinde ölçeğin bütün boyutlarında ve genelinde anlamlı bir farkın bulunmadığı belirlenmiştir. Ölçeğin geneline bakarsak kız öğretmen adayları 21,01 puan; erkek öğretmen adayları da 19,93 puan almıştır. Bu puanlar cinsiyete göre anlamlı bir fark olmadığını ortaya koymakla birlikte alınabilecek en yüksek puanın 52 olduğu göz önüne alındığında, öğretmen adaylarının empati düzeylerinin ortalamasının altında olduğu ifade edilebilir.

b) Sınıfa göre

Tablo 4: Öğretmen Adaylarının Sınıflarına göre Empatik Yönelimlerine Ait T-Testi Sonuçları

Bağımsız Değişken		N	Puan	ss.	T	df	P
Bilişsel Empati	Birinci	78	12,4231	4,91887	-,805	145	,422
	Dördüncü	69	13,1014	5,29746			
Empatik İlgi-Sempati	Birinci	78	1,2949	1,90767	-,754	145	,452
	Dördüncü	69	1,5652	2,43430			
Emosyonel Yanıt	Birinci	78	5,0513	1,39477	,586	145	,559
	Dördüncü	69	4,9275	1,12875			
Sosyal Yeti	Birinci	78	1,5128	1,17045	-1,240	145	,217
	Dördüncü	69	1,7536	1,18080			
GENEL	Birinci	78	20,2821	6,52248	-1,009	145	,314
	Dördüncü	69	21,3478	6,23280			

Öğrenim gördüğü sınıf düzeyine göre öğretmen adaylarının empatik yönelimlerine ait t-testi sonuçları Tablo 4'ten incelendiğinde bütün boyutlarda " p " değerlerinin " $0,05$ "den büyük olmasından dolayı hiçbir alt boyut ve ölçeğin bütününe ilişkin anlamlı bir fark bulunmamıştır. Bu durum da bize göstermektedir ki fakülteye geldikleri andan itibaren sonuna kadar öğretmen adaylarının empati düzeylerinde fark yaratacak düzeyde bir artış olmamaktadır.

c) Bölüme göre:

Tablo 5: Öğretmen Adaylarının Bölümlerine göre Empatik Yönelimlerine Ait T-Testi Sonuçları

Bağımsız Değişken		N	Puan	ss.	T	df	P
Bilişsel Empati	PDR	91	12,758	4,675	,051	145	,960
	Türkçe	56	12,714	5,755			
Empatik İlgi-Sempati	PDR	91	1,165	1,797	-1,847	145	,067
	Türkçe	56	1,840	2,627			
Emosyonel Yanıt	PDR	91	4,912	1,279	-,984	145	,327
	Türkçe	56	5,125	1,266			
Sosyal Yeti	PDR	91	1,473	0,970	-2,034	145	,044
	Türkçe	56	1,875	1,428			
GENEL	PDR	91	20,308	5,730	-1,149	145	,252
	Türkçe	56	21,554	7,324			

Öğrenim gördüğü bölüme göre öğretmen adaylarının empatik yönelimlerine ait t-testi sonuçları Tablo 5'de verimştir. Tablo incelendiğinde Bilişsel Empati (" $t=,051$ " " $p=,960$), Empatik-İlgi-Sempati (" $t=-1,847$ " " $p=,067$ "), Emosyonel Yanıt (" $t=-,984$ " " $p=,327$ ") ve ölçeğin geneline ilişkin (" $t=-1,149$ " " $p=,252$ ") " p " değerleri $0,05$ den büyük olduğundan $p<0,05$ düzeyinde anlamlı bir fark bulunamamıştır. Sosyal Yetide ise " $t=2,034$ " ve " $p=,044$ " olduğundan $p<0,05$ düzeyinde anlamlı bir fark bulunmuştur. PDR bölümü öğrencilerinin Sosyal Yeti alt boyutundaki ortalaması " $1,473$ " Türkçe Öğretmenliği bölümü öğrencilerini ortalaması ise " $1,875$ " puandır. Bu durum Türkçe Öğretmenliğinde öğrenim gören öğretmen adaylarının daha yüksek empati

düzeğine sahip olduğunu göstermektedir. Bu boyutta böyle bir bulgu elde edilmesine rağmen ölçeğin geneli için hemen hemen her iki bölümdeki öğrencilerin de aynı empati düzeyine sahip oldukları belirlenmiştir.

Sonuç, Tartışma ve Öneriler

Öğretmen adaylarının empati düzeylerini ortaya koymak ve empati düzeylerinin çeşitli değişkenlere göre farklılık gösterip göstermediğini belirlemek amacı ile eğitim fakültesinin Psikolojik Danışmanlık ve Rehberlik (PDR) ve Türkçe Öğretmenliği Anabilim Dallarında öğrenim gören 147 öğretmen adayı ile gerçekleştirilen bu araştırmaya ait ulaşılan sonuçlara aşağıda yer verilmiştir:

Öğretmen adaylarının empati düzeyleri oldukça düşüktür. Eğitim Fakültelerinde öğretmen adaylarının empati düzeyini geliştirecek derslere ve etkinliklere daha fazla yer verilmelidir. Karşısındaki kişinin ne isteyebileceğini anlamayan bir kişiden verimli bir öğrenme ortamını oluşturmasını beklemek doğru bir yaklaşım olarak görülmemelidir. Öğretmen adaylarının empati düzeyini arttıracak derslere ve etkinliklere yer vermek, gelecekte öğrencilerini tanıyan, anlayan ve onlar için en uygun öğrenme ortamlarını yaratabilen öğretmenlerin var olmasını sağlayacaktır.

Araştırma bulgularına göre kızların ve erkeklerin empati düzeylerine ilişkin puanları arasında anlamlı bir fark bulunmamıştır. Dördüncü sınıfta öğrenim gören öğretmen adayları ile birinci sınıfta öğrenim gören öğretmen adaylarının empati düzeyleri arasında da anlamlı bir fark belirlenmemiştir. Eğitim Fakültelerine başlayan öğretmen adaylarının mezun oluncaya kadar bazı özelliklere sahip olmasını beklemek gayet doğaldır. Bir öğretilerde bulunması gereken kişisel nitelikler göz önüne alındığında ilk akla gelen özellikler, hoşgörölü ve sabırlı olma, anlayışlı, sevecen ve espirili olma, cesaretlendirici ve destekleyici olma, açık fikirli esnek ve uyarlayıcı olma, yüksek başarı beklentisi içerisinde olma gibi özellikler gelmektedir. Ancak gözden kaçan durum şudur ki, bu özelliklerin bir çoğu kendi içerisinde empati kurabilmeyi barındırmaktadır. Bu nedenle öğretmen adaylarının fakültelele geldiği andan itibaren ayrılınca kadar empati düzeylerinde belirli bir gelişme göstermesi gerekmektedir. Bunun içinde gerekli empati geliştirici çalışmalara fakültelerdeki ders programlarına dahil etmek gerekmektedir. Ayrıca öğretim üyeleri de bu konuda üzerlerine düşeni yerine getirmelidir.

Psikolojik Danışmanlık ve Rehberlik Anabilim Dalı'nda öğrenim gören öğretmen adayları ile Türkçe Öğretmenliği Anabilim Dalı'nda öğrenim gören öğretmen adaylarının genel empati düzeylerine ait puanları arasında da anlamlı bir fark bulunmamıştır. Ayrıca Türkçe Öğretmenliği bölümünde öğrenim gören öğretmen adaylarının PDR bölümünde öğrenim gören öğretmen adaylarına kıyasla sosyal yeti empati düzeylerinin daha yüksek düzeyde olduğu belirlenmiştir. Aslında bu branşlardaki öğretmen adaylarından Psikolojik Danışmanlık ve Rehberlik Anabilim Dalı'nda öğrenim görenlerin empati düzeyinin daha yüksek olması beklenirken, Türkçe Öğretmenliği Anabilim Dalı'nda Öğrenim gören öğretmen adaylarının ölçeğin geneline ilişkin anlamlı bir fark oluşturmamak ile birlikte az da olsa daha yüksek olduğu belirlenmiştir. Bütün branşlarda önemli olmak ile birlikte özellikle Psikolojik Danışma ve Rehberlik Anabilim Dalı'nda öğrenim gören öğretmen adaylarının mesleklerini en doğru bir şekilde yerine getirebilmeleri için de empati kurabilme becerisine sahip olması son derece önemlidir. Bu nedenle de empati düzeyini geliştirecek etkilere yer verilmesi son derece önemlidir.

İlahiyat Fakültesi Balcalı, Adana
myildirim@cu.edu.tr

Özet

İlk insandan günümüze kadar herkes az ya da çok ölümün neliği ve nasıllığı ile ilgilenmiş, ölümü anlamaya ve onun vereceği acıyla başa çıkmaya çalışmıştır. Kuşkusuz her insan kendi mesleği, meşrebi, dünya görüşü ve kişiliği açısından ölümü farklı şekillerde yorumlamıştır. Genellikle bilimsel açıklamalar soğuk ve korkutucu kabul edilirken dinî ve tasavvufî izahlar, ölümün bir son değil yeni bir hayatın başlangıcı olduğunu vurgulaması hasebiyle revaçta olmuştur. Bu çalışmada öncelikle ölüm olgusuna yüklenen anlamlardaki değişim üzerinde durulacak, daha sonra ölüm düşüncesinin ürettiği kaygıyla başa çıkma hususunda Kübler-Ross'un "acının beş evresi" olarak tanımladığı aşamalarda dini-manevi başa çıkmanın etkili olup olmadığı tartışılacaktır. Çalışma nitel bir desene bağlıdır. Veriler bilimsel kaynaklardan ve araştırmacının gözlemlerden hareketle toplanmıştır. Toplanan veriler betimsel analiz tekniğiyle çözümlenmiş, anlayıcı geleneğe bağlı olarak yorumlanmıştır. Ulaşılan sonuçlara göre ölümle ve kayıplarla başa çıkma sürecinde ortaya çıkan "şok ve inkâr", "isyan ve öfke" ile "depresyon" aşamaları, "mevcut gerçekliği reddetme", "Allah'a isyan" ile birlikte "manevî ve sosyal destekten yoksunluk" içerdiği için olumsuz dinî başa çıkma şekilleri olarak değerlendirilebilir. Pazarlık aşaması olumlu dinî başa çıkmanın ilk adımı kabul edilebilir. Bu süreçte ibadet ve dua başta olmak üzere dinî yaşantıda artış gözlenir. Kabullenme aşamasında olumlu dinî başa çıkma stratejilerinden olan "takdir-i ilahî" ve "lütüf da hoş kahır da hoş" anlayışı ön plandadır.

Anahtar Kelimeler: Ölüm, yasın beş evresi, inanç, başa çıkma

Giriş

İlk insandan günümüze kadar herkes az ya da çok ölümün neliği ve nasıllığı ile ilgilenmiş, ölümü anlamaya ve onun vereceği acıyla başa çıkmaya çalışmıştır. Kuşkusuz her insan kendi mesleği, meşrebi, dünya görüşü ve kişiliği açısından ölümü farklı şekillerde yorumlamıştır. Genellikle bilimsel açıklamalar soğuk ve korkutucu kabul edilirken dinî ve tasavvufî izahlar, ölümün bir son değil yeni bir hayatın başlangıcı olduğunu vurgulaması hasebiyle revaçta olmuştur. Bu çalışmada öncelikle ölüm olgusuna yüklenen anlamlardaki değişim üzerinde durulacak, daha sonra ölüm düşüncesinin ürettiği kaygıyla başa çıkma hususunda Kübler-Ross'un "acının beş evresi" olarak tanımladığı aşamalarda dini-manevi başa çıkmanın etkili olup olmadığı tartışılacaktır. Çalışma nitel bir desene bağlıdır. Veriler bilimsel kaynaklardan ve araştırmacının gözlemlerden hareketle toplanmıştır. Toplanan veriler betimsel analiz tekniğiyle çözümlenmiş, anlayıcı geleneğe bağlı olarak yorumlanmıştır.

Ölüm Hadisesine Yaklaşımlar

Yerine ve durumuna göre "ölüm" bazen stres kaynağı iken, bazen de stresten kurtulma umudu olarak algılanabilir. Hatta kimine göre o, yok oluşun simgesi iken, kimine göre ölümsüz bir hayatın başlangıcıdır. Ölümü algılama ve anlamlandırma biçimine göre insan, ölüm karşısında kaygı yahut sevinç duyabilirler. Bu durum ölüm kavramının, farklı kültür ve toplumlar arasında farklı şekillerde tanımlandığı, bireylerin de öznel kişilik yapısı içinde bu olguya nasıl bir anlam ve değer yükledikleri ile yakından ilişkilidir.

Freud'a (2016; 2017) göre bütün kaygı ve korkuların temelinde ölüm düşüncesi vardır. Bununla birlikte Freud kariyerinin ilk dönemlerinde insanın libidinal hazlarının yaşamdan tat almaya odaklı olduğunu söylerken insanda organikite inorganite dönme içgüdüsünün de olduğunu söylemiştir. Buna göre insan aslında ölmek için yaşayan bir varlıktır. Çünkü insan ölmekten korkar. Jung (1958; 1996), ölümü, kişi için bir bütünleşme ve kendini gerçekleştirme süreci olarak nitelendirdiği "bireyleşme" süreci çerçevesinde ele almıştır. Ona göre birey, hayatının ikinci devresinde, ölüme hazırlıkla uğraşır; dinler, kişiyi, ölüme hazırlık sürecinde yardımcı olacak motivasyonlar sunar. Logoterapi yaklaşımının kurucusu Frankl (2006; 2014; 2016), ölümün ve acının hayata anlam katıp hayatı tamamlayan unsurlardan olduğunu belirtmiştir. Varoluşçu yaklaşımın temsilcilerinden Yalom (2001; 2006), ölüm kaygısının her yerde ve her yaşta var olduğunu; insanın, yaşamı boyunca, hayat enerjisinin bir kısmını bu kaygıyla baş edebilmek için harcadığını ifade etmiştir.

Kur'an-ı Kerim'de geçen "*Her nefis ölümü tadacaktır.*" (29/Ankebût, 57) mealindeki ayet başta olmak üzere temel dinî metinlerde insanlara sıklıkla ölümlü oldukları gerçeği hatırlatılarak onların doğru yola (sırat-ı müstakim) kılavuzlanmaları istenmektedir. Çünkü bireysel dindarlığın en önemli kaynaklarından birisi de insanın ölümlü (fâni) bir varlık olmasıdır. Batson ve Ventis (1982, s. 8) dindarlığı; "*Kendimizin ve diğer insanların bir gün öleceğini anlamamız sebebiyle karşı karşıya kaldığımız sorunları çözebilmek için yaptığımız her şeydir.*" şeklinde tanımlarken bu hususu açıkça ifade etmektedir. Zira ölüm, sonsuzluk arzusu ile fanilik arasında sıkışan insanın varoluşsal bütün kaygılarını alttan alta besleyen bir olgu olarak karşımıza çıkmaktadır (Yapıcı, 2007).

İnanç sistemlerinin mensuplarını ikna edici tarzda içten bir kavrayışla kendisine sınırsız çekmesi kuşkusuz dinlerin hayata ve ölüme anlam yüklemesiyle yakından ilişkilidir (Willaime, 1995; Yapıcı, 2003; 2007). Bununla birlikte sekülerleşen modern dünya, bireylerin dinî duygu ve bağlarını zayıflatarak adeta onlara ölümü unutturmuş, dahası değerlerden arınmış bir şekilde sınırsız hazlarla dolu bir yaşam sunmuştur (Yapıcı, 2017). Bu durumu Ariés (1991: s.85-86) modern insanın ölümü hayatından çıkartmak için gösterdiği her türlü çabayı ihtiva eden "*yasaklanan ölüm*" kavramıyla ifade eder, Bauman'a (2000, s. 127) göre modern insanın ölümü kabullenmesi geleneksel insana göre daha zordur. Çünkü modernlik öncesi çağda ölüm, hayatın doğal bir sonucu olarak görüldüğünden bugünkü kadar ürkütücü algılanmamaktadır .

Hayatın ve zevklerin yok olacağı düşüncesinin verdiği kaygı ve rahatsızlıktan ölüm gerçeğini unutarak kurtulmaya çalışan modern insan, yaşamın doğal bir sonucu olan ölümü kabullenmekte zorlanmaktadır. Bu zorluk, hem kişinin bizzat kendi ölümüyle yüzleşmesi sürecinde yaşanan travmalarda, hem de evlat, ebeveyn ve eş gibi sevilen kişilerin ölümüne şahit olunduğu zaman ortaya çıkmaktadır.

Bir insanın kanser veya AIDS gibi ölümcül bir hastalığa yakalandığını duyduğu yahut çok sevdiği bir yakının ansızın ölüm haberini aldığı durumda gösterdiği tepkiler genellikle birbirine benzerdir. Bu konuda araştırmalarıyla ünlü Kübler-Ross (2010) özellikle tıbben öleceği teşhisi konulmuş ancak henüz şuuru kaybetmemiş hastaları inceleyerek geliştirdiği modelde beş psikolojik evreden bahsetmiştir . Burada hatırlatmak gerekir ki Kübler-Ross'un (2010) bu modeli sadece öleceği haberini alan terminal dönemdeki hastalar için değil yakınların vefatı, kaza sonucu organ kaybı ya da engelli bir bebeğe sahip olmak gibi durumlarda da geçerlidir.

Ölüm ve Acıyla Karşılaşma Süreci:

1- Şok ve İnkâr Evresi: Olumsuz bir haberin ya da kaybın ilk duyulduğu anda şok ve hissizlik yaşanır. Gelen bilginin reddedilip inkâr edilmesi söz konusudur. Bu evrede kişi ölümün kendisine ya da sevdiği kişiye bu kadar yakın olduğunu bir türlü kabullenemez. Genellikle "*Hayır, bu doğru olamaz!*" şeklinde tepkiler verilir, hatta tıbbî tahlillerde yanlışlık olduğu yahut tahlillerin karıştığı iddia edilebilir. Aslında beklenilmeyen bir biçimde ansızın gelen ve şok etkisi yapan haberlerden sonra devreye giren inkâr, adeta koruyucu bir tampon işlevi üstlenerek kişinin geçici de olsa kendini toparlamasına ve daha farklı savunma mekanizmalarına geçiş yapmasına zemin hazırlamaktadır.

2- İsyan ve Öfke Evresi: İnkâr durumu genellikle fazla sürmez ve onun yerini öfke, isyan ve küskünlük duyguları alır. "*Neden ben?*", "*Ben bunu hak etmedim.*", "*Yeryüzünde o kadar kötü ve iğrenç insanlar varken neden ben öleceğim?*" şeklinde tepkiler ortaya çıkabilir. Sevdiğini kaybeden kişilerde de benzer tepkiler gözlenir. İsyan ve öfke evresi inkâr evresine nispetle daha dirençlidir. Yerine ve durumuna göre doktorlara, hemşirelere, hatta Allah'a ve kadere isyan söz konusudur.

3- Pazarlık Evresi: Acıklı haberi alan insan, inkâr ve öfkenin işe yaramadığını görünce kaçınılmaz sonun ertelenmesini talep eden bir uzlaşıya ihtiyaç duyar. Burada "*öfkelenmek işe yaramıyor. Allah'ın dediği olur. En iyisi Allah'a dua ederek O'ndan sağlık, sıhhat ve uzun ömür isteyeyim.*" düşüncesi hâkimdir. Terminal dönemdeki hastalar ya da bir kayıp yaşayan kişiler çoğu kere Allah'la bir pazarlığa girer. Adak adama psikolojisi bu bağlamda oldukça dikkat çekicidir. "*Eğer iyileşirsem kurban keseceğim*", "*Kendimi Allah'a adayacağım*", "*Malımı mülkümü Allah yolunda harcayacağım*" tarzı ifadeler sıklıkla duyulur.

4- Depresyon Evresi: Ölümcül hastalığın artık inkâr edilemediği, cerrahî müdahalelerin çoğaldığı, hastanede yatma süresinin uzadığı ve artan semptomlarla birlikte fiziksel yapı belirgin bir şekilde zayıflayıp güçsüzleşince hasta gülümseyemez duruma gelir. Bu süreçte öfke ve hiddet yerini derin bir yokluk hissine bırakır. Benzer bir durum sevdiği insanı kaybedenlerde de görülür. Ölüm gerçeğini inkâr edemeyen, öfke ve pazarlık süreçlerinden de istenen çözüme ulaşamayan kişilerde duygu durum bozuklukları, yalnızlık ve çaresizlik hissi, düşük öz saygı, sosyal çevreden uzaklaşma, içe kapanma, ağlama, iştah bozuklukları ve fiziksel güçsüzlük gibi depresif belirtiler baş gösterir.

5- Kabullenme Evresi: Bu aşamada artık ölüm kabullenilmeye başlar. Ölümle başa çıkma mekanizmaları gelişmiştir. Ancak kişinin kendi ölümünü kabullenmesi ile sevdiği kişinin ölümünü/kaybını kabullenmesi farklı süreçler içermektedir. Açıklamak gerekirse hasta eğer bu aşamaya kadar ölmemişse, daha önceki aşamalarda kendisine biraz da olsa destek verilmişse ne kaderine karşı öfkelenir, ne de depresyon yaşar. Bununla birlikte o, sağlıklı bir şekilde yaşamlarına devam eden diğer insanlara zaman zaman imrenebilir. Yaklaşan sonla birlikte yaşamdan ve sevdiklerinden ayrılacağını düşünerek hüznlenir. Sevdiği bir yakını kaybeden kişi ise yaşanan kaybı kabullenerek eski yaşamına geri döner.

Ölümle ve kayıplarla başa çıkma sürecinde ortaya çıkan “şok ve inkâr”, “isyan ve öfke” ile “depresyon” aşamaları, “mevcut gerçekliği reddetme”, “Allah’a isyan” ile birlikte “manevî ve sosyal destekten yoksunluk” içerdiği için olumsuz dinî başa çıkma şekilleri olarak değerlendirilebilir. Pazarlık aşaması olumlu dinî başa çıkmanın ilk adımı kabul edilebilir. Bu süreçte ibadet ve dua başta olmak üzere dinî yaşantıda artış gözlenir. Kabullenme aşamasında olumlu dinî başa çıkma stratejilerinden olan “*takdir-i ilahî*” ve “*lütüf da hoş kahır da hoş*” anlayışı ön plandadır.

Normal ve Anormal Yas Tepkileri:

Yas (matem), üzerine duygusal yatırım yapılmış bir nesnenin hayatımızdan çıkması, yani kaybedilmesi sonrasında yaşanan doğal fizyolojik bir duygudur.

Kübler-Ross’un (2010) sunduğu beşli evre, şayet çok sevilen bir yakının vefatından sonra yaşanacak olursa, bu durum normal yas tepkisi olarak değerlendirilebilir. Ancak yas her zaman normal değildir. Kayba verilen tepkiye fiziksel ve ruhsal sağlık sorunları eşlik etmeye başlamışsa, bu durumda “anormal duygusal tepkilerle örülü patolojik yas” denilen durum ortaya çıkar.

Yas tutma, yaşanılarak tamamlanması gereken doğal bir süreçtir. Normal yas sürecini yaşayamayan kişilerde ikincil ruhsal ve bedensel sorunlar gelişebilir. Bu nedenle kayıpların ardından normal bir yasın yaşanması sağlıklıdır. Örneğin babasını ya da evladının kaybeden bir kişi çevrenin de etkisiyle güçlü görünmek için ağlamazsa yasını tamamlamadığı için *zeigarnik* (yarım kalmışlık) etkisi denilen durum ortaya çıkar. Bu da onun kişiliğini olumsuz etkiler. Hz. Peygamberin oğlu İbrahim vefat edince gözlerinden yaş gelecek şekilde ağlaması (İbn Sa’d, 2001) psikolojik açıdan sağlıklı bir davranış olup bu durum onun yasını tamamladığını gösterir

Kişi kaybını sürekli inkâr ederse, sosyal çevre ilişkilerinde bozukluk veya gerileme görülürse, duygusal olarak donuk tepkiler vermeye başlarsa, iş yaşamı ve sosyal hayatı bozulursa bu durumda “normal olmayan yas” belirtilerinden bahsedilebilir.

Sonuç

Ölüm düşüncesinin bilinçte canlı bir şekilde var olması yas sürecini normalleştirmede önemlidir. Çünkü ölüm unutuldukça olağanüstü bir olay gibi algılanmakta, bu da yaşanan kayıplar/ölümler karşısında patolojik yas tepkilerine neden olmaktadır. Bu noktada Hz. Peygamber’in: “*Lezzetleri bıçak gibi kesen ölümü sıkça hatırlayınız.*” (Tirmizî, Zühd, 4; Nesâî, Cenâiz, 3) hadisi sadece ahlakî ve dinî hayat açısından değil, bununla birlikte ölümü normalleştirme ve yas tepkilerinin sağlıklı verilebilmesi anlamında yeniden değerlendirilmelidir.

Abstract

Introduction: Type 1 Diabetes Mellitus is a chronic disease that is expanding and increasingly affects children and adolescents, resulting in changes in their lifestyle as well as in their families. **Objective:** To identify the experiences of parents regarding their child's Diabetes Mellitus. **Methods:** Qualitative, phenomenological study, having as participants 14 parents of children and adolescents who have diabetes and are followed up in consultations. We used the semi-structured interview and carried out content analysis. **Results:** Diabetes in children leads to a family restructuring and in particular to changes in diet and relationships with other children; represents a load of negative feelings and fears that lead to the demand for new parental skills and to the appreciation of health professionals and supports received. **Conclusions:** The results can help health professionals in the development of parental role, namely in accepting and adapting to the disease, in overcoming the difficulties and, above all, in improving the family's quality of life.

Introduction

The scientific and technological development has allowed the diagnosis of chronic diseases to be made increasingly early. Thus, an adequate therapeutic plan can be designed in order to control the evolution of the disease. Although early diagnosis does not prevent the onset of the disease, it contributes to a favourable outcome, preventing risks and complications (Gregory, Moore, & Simmons, 2013). Type 1 Diabetes Mellitus is a chronic, complex, and difficult to control disease that interferes with the quality of life of both the patients and their families. Correia (2011) points out that the unpredictability, characteristic of diabetes, generates a sense of discomfort and insecurity in parents when they are not close to their diabetic children. Over the past decades, it has been verified that the incidence of this disease is increasing in children and young people. In 2010, 18 new cases of Type 1 Diabetes were detected per 100,000 young people aged 0-14 years, nearly twice as high as in 2000 (similar to that observed in the 0-19 age group) (Boavida et al. 2012). This reality requires joint efforts on behalf of the health professionals, the child/adolescent and the family, with regard to the adaptation, treatment and metabolic control of this disease in order to minimize the complications that may result in the long term as well as to maintain the quality of life (Almino, Queiroz, & Jorge, 2009). Therefore, the need to involve the family as an integral part of the whole care process of the diabetic child and adolescent is evident (Alencar, & Alencar, 2009). In this sense, it seems relevant to identify the experiences of the parents regarding their child's Diabetes Mellitus. In fact, the family constitutes a system in which the behaviour of each individual is interdependent of the others (Correia, Franco, Demário, & Santos, 2012), and when exploring the parents' experiences of this phenomenon, we can obtain subsidies for the improvement of the health care provided by health professionals to the child/adolescent with diabetes as well as to their family (Sousa, 2012).

Methodology

In our clinical practice we have seen an increasing number of children and young people with type 1 diabetes. Inevitably, we have also noticed the difficulties, anxiety, fears and exhaustion of parents in dealing with this situation.

In order to identify the parents' experiences with their child's Diabetes Mellitus, we developed this study based on the following research questions: What are the feelings experienced by parents after the diagnosis of Type 1 Diabetes Mellitus has been made to their child? What experiences struck the parents during the process of acceptance and adaptation to diabetes? To what extent did the intervention of the health professionals influence the adaptation of the child/adolescent and his/her family to diabetes?

We conducted a qualitative, exploratory-descriptive, phenomenological study using the semi-structured interview. The target audience was the parents of children/adolescents with Diabetes Mellitus type 1 who are followed in the Paediatrics External Consultation of a Hospital Centre in the North of Portugal. We used a non-probabilistic sample of 14 parents (10 mothers and 4 fathers). The inclusion criteria were parents of a child or adolescent with Type 1 Diabetes Mellitus, 4 years of age or over, and in whom the diagnosis of the disease had been carried out more than 6 months ago. The study had been authorized by the Hospital Centre and obtained a favourable opinion from the Ethics Committee. The interviews were carried out by the researcher in a private consultation office and, prior to each interview, parents were informed of the objectives, benefits and nature of the research, and the

confidentiality and anonymity of the data was ensured. We obtained a written informed consent from each parent to guarantee eligibility to participate in the study.

A coding grid was drawn up for each interview, with the interview number, time and duration. An audio recorder was used and later the interviews were transcribed into a word document. We performed the content analysis by coding the data (Amado, 2000; Bardin 2009; Streubert, & Carpenter, 2002). That is, the relevant characteristics of the message content were transformed into units so as to allow their description and precise analysis. A careful reading of each interview was carried out, followed by a re-reading in the attempt to eliminate irrelevant information for the study and to better understand the material analysed in order to construct the categories. For each interview a code was assigned (M1 to M10 for mothers and P1 to P4 for fathers).

Findings

Our sample is composed of 14 participants, 10 mothers and 4 fathers. We found that 57.1% are between 31 and 40 years old. All parents are employed and 50% of the mothers, too. The majority of the participants (57.1%) has a level of schooling below secondary level, 28.6% completed the secondary level and 14.3% have a degree in higher education.

Regarding marital status, 78.6% of the participants are married and 21.4% live in a non-marital partnership. Half of the sample has 2 children, 35.8% have 1 child and 7.1% have 3 children and the same percentage has more than 3 children.

To what concerns children/adolescents with diabetes, 8 of them (57.1%) are boys and 6 (42.9%) are girls. The majority is between 6 and 10 years old (57.2%) and only 21.4% are between 11 and 15 years old. In the majority of the children, diabetes was diagnosed before the age of 5 (57.2%).

Regarding the elapsed time since the diagnosis was made, we verified that it had been performed more than 4 years ago in 42.9% of the children, between 2 and 4 years in 21.4% of the children, and between 6 months and 2 years in 35.7% of the children/adolescents.

On the following pages we present the content analysis of the interviews. Taking into account the process inherent in qualitative studies, the categories that are represented in the following tables with their indicators arose.

Impact Of Diabetes On The Family

It was verified that the diagnosis of diabetes ascends within the family, changing its dynamics. The parents' discourse reveals the existence of the impact of diabetes on the family (Table 1), giving rise to the need for a restructuring of the family life. We have verified the existence of seventeen enumeration units in this indicator. The parents report this fact as follows: "(...) *there were some repercussions, we had to change some habits (...)*" (M3), or even more significantly "*I had ... to stop working. P had to be pricked and I had no help (...)*" (M6).

In the implications on the parents' personal life, we witnessed the difficulties experienced and felt because of diabetes, both in terms of accepting it and in the repercussions that it entails. Examples of this are expressions such as "(...) *at first, I did not want to believe it (...) but then I accepted it, I had no choice (...). I tried to adapt to hospitals, to insulin (...)*" or even "(...) *sleep, forget it! I do not think I have slept a single night*" (M3).

In addition to the personal implications, the onset of diabetes in the family also affects the social life of the parents. The speech of the parents reflects this constraint especially with regard to their children's school and to them being a part of society when they state, "(...) *I wanted to take my child out of the nursery. I was afraid that they were not prepared to administer insulin and also because of the food (...)*" (M10), and also "*When we are sometimes socializing (...) and he/she wants to eat and we cannot allow it (...) people start to stare (...)*" (P1), or in the expressions "(...) *people are sometimes a bit uneducated in this aspect (...) I feel like using foul language!*" (P2).

Table 1 – Impact of diabetes on the family

Category	Indicators	Recording unit
Impact of diabetes on the family	Restructuring of family life	17
	Implications in personal life	12
	Implications in social life	8

Parents' Feelings/Emotions

The diagnosis of diabetes represents a milestone in the life of parents with a huge negative burden that provoked several feelings in the participants of this study (Table 2). The most expressed feeling by parents was fear/insecurity. "(...) *one is always afraid (...) always afraid that something will happen (...)*" (M3). As a consequence of fear, insecurity also arises "(...) *even when I was told "now you do not need to see it in the middle of the night", I would still see it, that is how it is..."*" (M3), or as participant M9 describes it "(...) *not showing my insecurity was very complicated (...)*".

The second feeling most referred to by parents was concern. The fact that the child has diabetes represents, for most parents, an increased responsibility (M1, M5, M6, M7, M8, M9) with a need for control, as M3 states: *"It is always that anxiety about whether or not everything is okay... it is that concern (...)"*. P2 and M10 also stress this idea when they say *"I am always more worried, I have to always be on top of him (...)"*.

We verified that sadness/anguish is also within the feelings that are the most visible by the participants in the study. Many times this sadness is manifested by crying: *"I got tired of crying in this hospital ... it was complicated!"* (M6, M4, M8, M9). In some of the parents, this feeling lingers and accompanies them on a day-to-day basis, as verbalized by P2 *"It took a toll on me and still does."*

Revolt/frustration was also reported by the parents. Participant M4 testifies this revolt when she says *"(...) why did it have to happen to our daughter? Why her?"*. Also, father P1 stresses this feeling when he says *"(...) I felt destroyed ... and revolted (...) I was outraged"*.

Feelings like guilt and denial also emerged in the analysis of the data. Initially, the non-acceptance of that reality *"(...) I did not believe it..."* (M2) and later the feeling of guilt when confronted with the diagnosis of diabetes *"(...) I am almost positive that I did not wash my hands well when I made her soup, or I did something wrong when she was a baby (...)"* (M4). Sometimes blame perpetuates, as expressed by P2 *"We always feel guilty (...)"*.

	Concern	11
	Sadness/anguish	10
	Revolt/Frustration	8
	Guilt	4
	Denial/shock	4
	Disorientation	3

Changes in Family Life

The diagnosis of diabetes forced some changes in the family life of the study participants (Table 3). The change in eating habits was the most mentioned indicator: *"We learned how to eat better, to eat at certain times of the day."* (M5).

We also found that after the diagnosis had been made, the parents felt the need to monitor and supervise their child more. This fact can be verified through various expressions made by the parents: *"(...) to be more on top of her (...) the need to have to watch over her"* (M1, P2, M8). However, this need is closely related to the concern with the child's clinical situation, as can be seen in the following excerpts: *"(...) stressful day and night (...) we never let J. sleep alone at night (...)"* (M9); *"I always carry my mobile phone (...) then she calls me (...) to say (...) how she is doing"* (M10).

The verbalisation of the participants regarding the limitations of going out is also noticeable. *"We ... basically stopped going out, to restaurants"* (P1, P2); M9 says *"(...) we stopped doing some less important things, like going out, trips to the beach"*. This limitation is justified by P3 when stating that *"The disturbance had to do with him going to the house of his grandparents, uncles, because people do not want to be held responsible for such care."* Some parents also voiced the need for some changes related to diabetes, for instance: *"What changed was having to measure the amounts and give him insulin according to the amount"* (P3), and also *"(...) in the morning, there is always that precaution to get up early (...) and not enjoy what we are doing (...)"* (M10) and M6 points out *"I just had to stop working. P. had to be pricked and I had no help."*

Table 3 – Changes in Family Life

Changes in Family Life	Change in eating habits	14
	Higher monitoring and supervision of son/daughter	13
	Limitations of going out	8
	Changes related with diabetes	7
	Limitations in shopping	3

Changes in family dietary

We can see in this category (Table 4), that the most mentioned change was related to the type of dietary. The parents stated that they had to reformulate the dietary according to the type of food and quantities, as M2 states *"(...) I removed the sweets but added more vegetables!"* and also M4 *"(...) we are much more careful with what we eat (...) "*. Faced with the care inherent in diabetes, meal times also changed. Thus, M10 and P4 convey *"(...) we started having schedules to eat"*, and M2 as well *"(...) the schedules to eat changed, because she did not have any schedules (...) she ate whenever she wanted."* We also noticed that some participants stated that they only had to make some adjustments, such as M3 when referring *"(...) we already had everything more or less set, fixed meal times, except for supper (...) now everybody has supper (...) "*, or even M6 *"The only thing he changed was that he would not eat at night (...) "*.

One of the mothers said *"(...) during meals, we would all eat together and now I have to cook food separately (...) "* (M7), and M8 says that *"(...) I sometimes make two types of soup ... but the rest of the food is the same for everyone."*

They mentioned some difficulties in eating habits, mainly introducing vegetables in the dietary. One of the mothers (M8) reports that *"He would not eat a bit of cabbage or lettuce."* Regarding the ingestion of certain food items or sweets by their children, M4 refers *"(...) we sometimes have to be strict. And sometimes she eats without us noticing (...) "*.

Table 4 – Changes in Family Dietary

Category	Indicators	Recording Unit
Changes in Family Dietary	Type of dietary	12
	Meal Times	11
	Family dietary	9
	Difficulties felt by parents	9

Parenting children with diabetes

Some indicators that reflect the readjustment of family life emerged (Table 5). In this context, the development of parental competences has become crucial to allow the readjustment of the parental role. The parents' commitment to acquiring these new skills is noticeable throughout the speeches, especially when M7 and M9 refer, *"(...) I did not understand, nor did I know what it was, diabetes (...) after that I got used to it (...) "*. Still, M9 adds *"I have read absolutely everything on it (...) I try to do everything that is within my reach."* Also, P2 says that *"(...) the first time I administered it, (referring to insulin) I had to bend down because I thought I would not be able to get back up" P2.*

Another one of the indicators refers to the difficulties in accepting diabetes. These are related to the parents' emotions as shown by P1 *"... there comes sadness from the bottom of the chest ... but it stays inside ... we try not to demonstrate it (...) "*, or M2 that says: *"It was a bit hard (...) because I was just a child (...) "*. In some cases this difficulty may be associated with parental perception as expressed by M10. *"As much as they say that she can live a normal life, she has to live a different life from everyone else,"* and P2 says *"He is more limited, he cannot play as much as he used to (...) "*.

Some positive aspects of the acceptance of diabetes, such as the fact that the child or adolescent has accepted his/her clinical condition, were perceived *"(...) he had enough strength for himself and for me "(P2). Another mother says "(...) but only because she reacted very well, she was not a girl who cried because she had to be pricked (...) I think we all adjusted well (...) "(M3).*

Some difficulties in the relationship are essentially related to the behaviour of the children, as we can see from the following excerpts: *"(...) we are still going through a phase ... everything is out of control ... we do not live well ... but we are living (...) "(P1). Also, M2 refers "(...) she will cry alone and not tell anyone anything (...) "*

Table 5 – Parenting children with diabetes

Category	Indicators	Recording Unit
Parenting children with diabetes	Development of parental competences	19
	Difficulty in accepting diabetes	6
	Favourable aspects for binding and accepting diabetes	7
	Difficulties in binding	5

Experiences with other children

In this category, the participants of the study mentioned behaviours and feelings related to the experiences of their children with other children (Table 6). We find that jealousy is felt among siblings of children or adolescents with diabetes, as P4 says. *"He was sometimes jealous, that I would pay more attention to her (...)"*.

On the other hand, some parents highlight the understanding and mutual help between siblings. M5 states that *"His brother very understands (...) if he wants something, he is careful enough so that the other does not see it."* M8 stresses this feeling by saying *"Her sister is very responsible (...) she helps out."*

However, some parents have expressed some difficulties in dealing with this situation given its peculiar characteristics. P4 says *"(...) it may not seem like it, but they are two children and sometimes I think that we are giving more affection to his sister than to him ... but we are not ..."* P2 reinforces this difficulty by referring *"One can and the other cannot; I think it's unfair (...) sometimes we try to avoid going out with them together just to avoid requests ..."*.

Table 6 – Experiences with other children

Category	Indicators	Recording Unit
Experiences with other children	Jealousy	5
	Understanding and mutual help	4
	Difficulties felt by parents	5

Fears experienced by parents

After the diagnosis of diabetes, the participants expressed some fears and anxieties regarding the future of their child (Table 7), namely fear of other pathologies appearing *"(...) there is always that fear that something else will happen with her health (...)"* (M4). Hypoglycaemia is also a cause for concern, and M5 points out *"(...) I am afraid because of his hypoglycaemia ..."*

Adolescence represents an important milestone in life, full of challenges, where autonomy is increasing and personality is created. Hence, this symbolizes one of the parents' yearnings about the future, as seen in the following excerpts: *"(...) when she goes to university, when she starts to go out at night and we can no longer say "do not eat that", "do not drink that", "do not do that", (...)"* (M4).

Vascular complications are a concern for some parents as witnessed in the expression: *"(...) losing a leg, (changes) of the eye sight (...) not being able to lead a normal life"* (M8).

Table 7 – Fears experienced by parents

Category	Indicators	Recording Unit
Fears experienced by parents	Diagnosis of other pathologies	5
	Hypoglycaemia	4
	Adolescence	4
	Vascular Complications	2
	Fear of making mistakes	1

Opinion on the health professionals and supports received

All of the parents expressed satisfaction considering the care of excellence provided. *"It's an excellent team (...). For both her and me, it helped a lot (...)"* (M2). Other parents also expressed their satisfaction: *"It was very good (...) our needs were fulfilled"* (P1, M9, P4).

Essentially, the study participants felt the support of the health professionals. Some examples of this are the expressions of M6 and M8 *"(...) the nurses, the doctor, in general"* and M9 *"(...) I liked it very much (...) and here in the consultation, we receive a lot of support"*. In addition to this support, the parents also mentioned the support of their child with diabetes *"(...) he had enough strength for himself and for me..."* (P2), and the support of other relatives as M5 states *"From my sister-in-law, from my other child (...) my sister-in-law (...) stays with him (...) if she didn't take care of him, I don't know how I would manage..."*.

Table 8 – Opinion on the health professionals and supports received

Category	Indicators	Recording Unit

Supports received	Support from health professionals	13
	Support of the child with diabetes	2
	Support from other family members	2
	Other supports	2

Discussion

The participants reported the difficulties felt when diabetes was diagnosed, as well as the need to restructure their family life, to establish new parental roles, and to take on the implications inherent in both their personal and social life.

Uncomfortable feelings such as a sadness, anguish, revolt, guilt and essentially fear, are present in the speeches of the participants in this study. The studies of Martins, Ataíde, Silva, & Frota (2013) also make it possible to perceive the suffering of the parents before their child's diabetes and the feeling of impotence before this diagnosis. Pilger, & Abreu (2007), point out that these feelings can be understood as a process through which parents face their child's illness and try to find a solution and to adapt to this new reality. At this stage, the role of the multidisciplinary team with the child or adolescent and their family is of the utmost importance, with the aim of providing them with the care needed to help them in this moment of change. In the study, the need that parents feel to supervise their child with diabetes is visible. This situation brings suffering and they feel a need for a greater dedication and vigilance. Some parents had to leave their professional activity in order to be entirely available to care of their child since they had no other support. This need was also verified in other studies. Leal, Fialho, Dias, Nascimento, & Arruda (2012) report that the difficulties experienced can comprise several dimensions and that the treatment of the disease requires special care and attention on behalf of the family.

Another change verbalised concerns social life. As in the study by Corrêa et al. (2012), when faced with diabetes, parents experience their social life with some limitations. At times, they stop going to places or participating in events and festivities, so that the child is not in contact with food that he/she should not consume. Martins et al. (2013) stress that even after adapting to the disease, families continue to avoid going out to social gatherings, which can lead to the family's social isolation.

The change in eating habits is perceived by the study participants as one of the main alterations, both with regard to the type of dietary as well as the need to establish meal times. Its restructuring implies changes that, in most cases, extend to the whole family. We also found that many parents see these changes as beneficial to the family's health, as food becomes healthier and there are meal times to follow.

With regard to the development of parental competencies, parents feel compromised in their parental role when faced with the difficulties inherent in diabetes. These adversities require developing skills and competences to become capable and to feel confident in caring for the child. The role of health professionals with the family is fundamental so as to contribute positively to the definition of the new parental roles, which is corroborated by Corrêa et al. (2012) and Martins et al. (2013).

We see an ambivalence of feelings in the relationship with other children. Parents perceive feelings of jealousy on behalf of the siblings, but also report understanding and mutual help. Sometimes they find it difficult to make decisions in relation to a healthy child and another child with a disease that implies certain limitations, mainly at the dietary level.

The analysis of the interviews shows the parents' yearning regarding the consequences and the risks of diabetes. The concomitant appearance of other pathologies and hypoglycaemia are the parents' most feared complications. We verified unanimity in parents' satisfaction with the care provided by health professionals. They mentioned the favourable contribution of the multidisciplinary team, especially the nursing team, in acquiring knowledge and skills on how to deal with diabetes. The interviewees said they felt the support, essentially from the health professionals, but did not rule out the pertinent support they felt from other family members, too.

Conclusions

The diagnosis of diabetes has repercussions in families with an enormous impact at a behavioural, personal and social level. The family faces a new reality and experience, new feelings and concerns, and the involvement of all its family members is necessary for the reorganization of the family dynamics.

Bearing in mind the starting points, we carried out a qualitative research in 10 mothers and 4 fathers to identify the feelings experienced with their children diagnosed with Type 1 Diabetes Mellitus, and to understand the most challenging experiences in the process of acceptance/adaptation in the caring for the child with diabetes.

Given the complexity of diabetes, parents' anguish, fear, and disorientation are understood after the diagnosis and throughout the process of acceptance and control of diabetes. In this sense, we sought to understand the extent to which the intervention of health professionals in the adaptation of the child and the family in this process of transition to diabetes was important.

From the feelings mentioned above, parents feel the need for greater vigilance and supervision of their children by dedicating much more attention and time to them. Given the characteristics of diabetes, the family needs to change eating habits, essentially with regard to the type of food and the meal times. Some of the respondents avoid participating in festivities or events so that the child does not have to be in contact with food that they cannot eat. When there are other children involved, parents face a daily challenge regarding decision-making in relation to a healthy child and another one with diabetes.

Some parents feel their parental role is compromised and seek to develop skills and abilities to become capable and confident to care for their child. Some parents feel disoriented, sad and sometimes guilty. Thus, they become very vulnerable, so the support provided to them is extremely important for parents to gain strength and to be able to care for their child.

All the interviewees mentioned the support of the health professionals as a valuable aid in the acceptance of diabetes, in the acquisition of skills and competences, and in the redefinition of the parental role.

With this study, we are better able to understand the experiences of the parents in relation to the child/adolescent with diabetes. In light of this data, health professionals will better understand the difficulties experienced by parents and thus foster good practices and improve the quality of life of the child and his/her family.

Patient's Privacy and Satisfaction: Sociological Study

Assoc. Prof. Dr. Erhan TECİM
Necmettin Erbakan University
Faculty of Social Sciences and Humanities
Department of Sociology
erhantecim@gmail.com

Abstract

The concept of “patient satisfaction” which one of the most important indicators of service quality, has started to gain importance with the development and transformation of customer oriented quality approach in the health sector. Patient satisfaction is a much more comprehensive phenomenon, as well as a highly effective variation such as patient privacy that is neglected by authors or academics. Privacy from the point of sociological view is a reflection of the most basic human right that can be expressed as “staying on its own”. It refers to a specific field situation without sharing yourself with someone else, without exposing, externalizing or linking with the other. This situation can be expressed as “body privacy”. This situation, which is considered as patient privacy in the literature, is divided into two in our study. It will be discussed in the form of “data privacy” and “body privacy” by differentiating it for the protection of personal information and the physical body.

While data privacy is widely known and legal arrangements are made, legislative regulations and academic interest in body privacy are much more backwards. It is emphasized that the basis of patient satisfaction is satisfaction of patient expectations and a wide range of patient-doctors and nurses' unity constitute the level of compliance. However, given attention to body privacy is one of the most important criteria for the efficiency of the hospital organization and for effective communication between physician and patient.

Key words: *Medical Sociology, Patient Satisfaction, Patient Rights, Patient Privacy, Body Privacy*

Peace Education: The Excellent Property Of Humanity

Abstract

The confrontation in the present day of the planet is dynamic planet since society has spontaneous the primitive society from the primitive to the modernization which be engaged from materialism, consumerism and informationism. Unfortunately, the violence and structural violence have been situated in the global phenomena. Peace education which is the excellent property of humanity will be taught in oneself and the others by the followings: 1) be faithful and respect in the goodness of yourself and the others. 2) be aware of conflict normality of learning. 3) be concerned in the individually differentiated ideology. 4) be understood of the changing and dynamic planet. 5) be taught in school by using the systematic thinking processes of all problems solution. Certainly given PEACE Model must be concerned as the followings, P= People those who understand in the human being differences, E=Education it should be run in every level of schooling, A=Activeness all of social institutions have to take effective actions, C=Community gaining the similarities and reduction of differences will be done, E=Earth the global will promote friendship, unity and fraternity both into direct and indirect ways.

Key words: Peace Education; the Excellent Property; Humanity; PEACE Mode

Introduction

In the wildly changing world science and technology play the major role of every dimension of development, politics, economics and socio-cultural, and also science and technology. Easiness of science is found possibly to accommodate human being prosperity. As we known already, materialism, consumerism and monetarism practically act on the social chaos, easily seen as in the present day. Selfish and actual violence is now impacting so what the damage of society decay. Peace which human being has been in the nostalgia will be taken place at all places. As the matter of fact, the binary of peace always shows in the social phenomena and the social condition, peace and conflict seem to be the homogeneous matter. However, peace and conflict is not the frozen phenomena of human being and is the open to challenge on ideological practice.

Peace Education: The Myth Of Being

The complexity of social phenomena in the present day rapidly spread out to human life especially self understanding together with the others understanding necessitated fruitful in the same doctrine. Based on the foregoing it should be declare with individual and interpersonal relation. The first element of conflict which is the primary of peace destroy is from one mind and his thinking negatively. Anyway, good mind and good thinking will be created for the better way of peace. (Strike, 1982)

Actually, the truth of peace is the metaphysics of global education. Education also takes part of gaining the habitant ideology of the nation development. Social order is also one category of discourse both of manifest or latent that be cultivated people for peace. Peace and conflict is naturally the binary opposition judged by people as the sides of good/bad. The myth and being of peace is projected into knowledge builder and knowledge acceptor.

What Is Peace?

Accordance to the definition of Peace by Webster's New Encyclopedic Dictionary is:

- 1: a state of tranquility or quiet as (Webster's New Encyclopedia Dictionary, 1993)
 - a: a freedom from civil disturbance or foreign war
 - b: a state of security or order within a community protected by law or custom
- 2: freedom from disquieting or oppressive thoughts or emotions
- 3: harmony in personal relations
- 4: a: a state or period of agreement between governments
 - b: a pact or agreement between combatant to end hostilities

Peace is very common sense of people since it covers a whole perspective of individual differences. People from their own culture sometime cannot get the full perspective and go not know why their behavior follows this grated pattern. Indeed, culture of peace is influential one's life from how they think and their practices. The ultimate action of peace is to create harmony and understanding clearly. With every community or organization's ideology or perspective, it is to create the great solution beyond the best solutions.

Why Peace Understanding?

There are some characteristics of peace which fulfills the humanity happiness. It is formed by the first small group in family. Individuals and community with complementary skills of basic under the differences are usually needed to form the prosperous happiness. Humanity is the recognition its global nature, the next step is the understanding to one another. Since we know that global is not the melting pot where all people blend in and become a homogenous mixture. People in the planet is also much more like a rich fruitcake where the yellow contrasts with the brightly colored strawberries and rich hues of the raisins. (McShane and Glino, 2005) The easy and high light of peace is education commitment. Education does not exist or act in a value free way, whatever it takes places in every space of learning. It must be formed by certain values. There is dividing between education and beliefs. Education normally embraces a commitment to 1) respect for the persons 2) the promoting of well-being 3) democracy 4) fairness and equality 5) opportunity and the last one 6 is the growth of all mental and physical body. (Somboon, 2003)

Understanding the principles of peace and for the citizenship is one thing. Putting the learners in active practice and manifesting them in order to behavior is quite another thing. It remains for us to examine the ways and means of training for good citizenship. However, the attainment of qualities and accomplishment envisaged the concept depends upon the, 1) innate abilities and capacities of learners 2) home influences and training 3) education program offered in the school for developing peace. (Tanej, 2001). All perspectives of mentioned are that developing peace programs out of learners' abilities, experience and know ledge will be and effective and interesting method of making them effective citizen in the future. Work selected or skill manifested should improve the learners' understanding of their role as civic people. Meanwhile, the first instructions of peace are imparted at home. It is the first lesson of living with the others. Here the learners become good considerate, thoughtful and well behaved. The civic responsibilities that begin at home extend in ever widening circle of school, community and the country.

Implication Of Peace For International Understanding

For the promotion of peace for international education is essential to

1. **Know** and understand how to people on other lands live;
2. **Recognize** the common humanity which underlines all differences in culture;
3. **Work** for fair and just world-order with security, freedom and fair-play for all people;
4. **Maintain** interest in the world affairs;
5. **Recognize** and help to solve world problems according to practices of democracy;
6. **Appreciate** the contribution of all people to world citizenship and that there is a human culture;
7. **Combine** love of one's own country with abroad social consciousness towards the problems of the world;
8. **Understanding** the economic and cultural factors which make the world inter- independent community of the nation;
9. **Respect** the dignity and worth of men by giving him equality of right and opportunities;
10. **Take** world one unit;
11. **Realize** the truth alone triumphs and leads to human progress and prosperity;
12. **Believe** in common values and goal for the world community;
13. **Understand** that victories of peace are greater than victories of war.(Taneja, V.R., 2001)

Once these basic concepts are realized by human being, achieve the goal of peace and world- understanding is very easily possible and practicable. Peace for international understanding we should try in our family firstly and then spread out to the community and other places conducted to men everywhere respective of different culture or nationality which we belong.

How to Handle Peace: Peace Model

Throughout the world, most of global citizen currently want peace since they are missing out of on education because they live in or come from conflict. Education is the fundament process for building up the global peace as urgently required. Overall picture of the world civil war and international conflict have completely devastated. Through socialization process, people are normally educated to follow norms, folkways and most people were not opposing it. In peace or homogeneous, norms reaching to “understanding the others” convention on how the human being should conduct themselves, approach things, as well as roles and requirement. It is also the process of reaching a balance.

PEACE Model is the one tool for gaining and developing the total happiness of the world.

1) **P = People**, the current world situation are conflicts. These are not to say, however, that the present study subscribes to the view that certain conflicts are rooted in primordial, ancient, or “tribal” hatreds that are incapable of resolution or change (see, for instance, Kaplan, 1994). The term of condition such as politics, economics and socio-cultural perspectives. In the “P” represented as people, all nations have to concerns about majority and minority in the slogan of “*reduce the differences and gaining the similarities*” as process of life with able to participate.

2) **E = Education**, Education is an important significant component for promoting interpersonal understanding. Normally education is divided into three types, formal education, informal and non-formal education, but their objectives totally put into the learners in cognitive domain, affective domain and psychomotor domain. Today’s learners will finish into the world where demand of individual differences, other understanding and societal live grow more every year. Thus, education must play the role of in creating or promoting the correct perspective of peace while they are in schooling. The skills to fuel peace are as the follows, participation, communication, connectivity, cooperation, coordination and collaboration (1P5C’s). As mentioned, education is wildly in the 21st century and learners who are civically literate, globally competency and digitally literate are better. Education especially national curriculum has to regularly emphasize peace studies in all levels. Curriculum must be paid interest in the personal development and can help them bridge the gap from childhood to adulthood with less pain than themselves perhaps experienced.

Thus, teacher is very essential key of education and knowledge distributed becomes “the power of academic status”. The task of teacher is to help learners and to facilitate their helping each others to comprehend that the future made. The way in which inquiry and debate or discussions are conducted in the classroom.

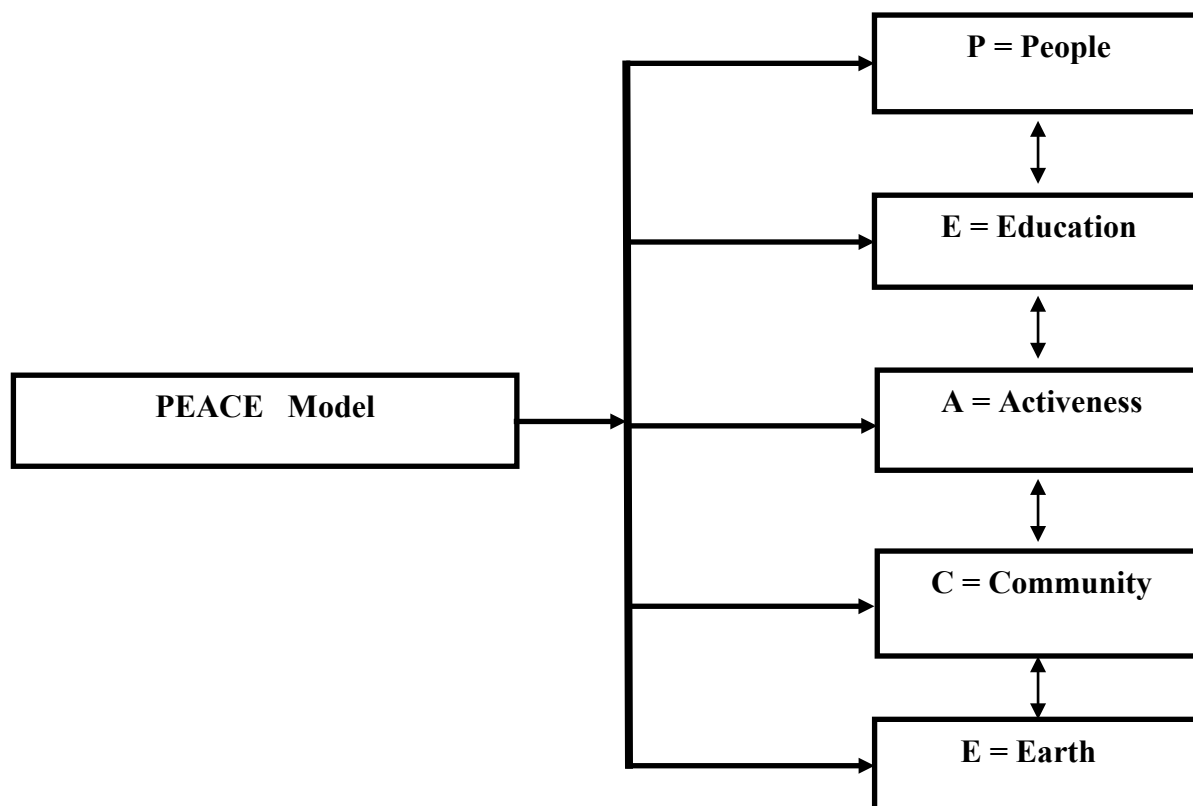

3) **A = Activeness**, both public sector and private sector will increase the involvement of all activities of public relations on promoting peace in policy, processes and operation. Responsible funding has to close every organization. Most of the traditional or historical views of the funding distribution experiences in only the private sector and sometime easily seen non beneficial usage.

In case of all activities promoted on peace must be practical frequently and public demands for accountability may results in more suits in the future.

5) **C = Community**, as known already community usually consisted of structure, format, pattern and members. The differentiated culture of community must be concerned because of its identity. The difficulty of much of this community, combined with an norms, rites or ritual which are formulated from community members. Issues on this perspective that particularly foster to the way of “Gaining of Similarity, Reduction of Differences”.

6) **E = Earth**, earth or the global is the same meaning, in today’s global community, teaching peace is very essential duty that must be undertaken by everybody. Happily cultural isolation is becoming a thing of the past. In order for the learners to be able to progress harmoniously through their life, restraints formally tolerated or imposed by societal attitude must be done away with. Everybody must seize the initiative and celebrate cultural diversity as the great quotation of Socrates that “*We are all citizens of the world*” People share the same universe, globe, country, cities and schooling places.

As mentioned already, peace can be taken place in every sphere and every level of society since we cannot refuse that happiness for all of those global people comes from peace earlier. Instead of looking the way when face the differences, all of people must seize the initiative and cerebrate cultural diversity. In summary PEACE can be projected as the chart following;

Conclusion

If communities are to help the growing generation to imbibe in them the art of living successfully and effectively, Peace education or education for peace should be the primary aim of the national education process which is the pillar of those who are in the nation happy. As the matter of fact, we are now living and spend our lives in the struggle and rivalry world. Human being is coming to realize, with disappointment and fear, war, scientific and technology progress, does not necessarily entail moral progress. Truly simplicity of living with care to each other and be understood the differences of culture among or in all contextualization of the world will become the global sustainable of peace.

Peer Bullying in Schools: Qualitative and Quantitative Study

Nihan Arslan
Fsm Vakıf University
narslan@fsm.edu.tr

Fatma Akin
Sakarya University

Abstract

This study was conducted in order to understand how peer bullying is handled by students and teachers, what can be done to prevent it, and how often students are exposed to it. The study area consists of 10 teachers and 366 students in the Hendek District of Sakarya. The research was a mixed study, the quantitative part was carried out by the adolescent students and the qualitative part by the teachers. In the qualitative part of the study, five questions were asked to teachers in order to identify teachers' views on peer bullying, what measures they took to prevent them, and how they responded to it. The research is based on semi-structured technique. Interview was first recorded by voice recording device, then converted into a written document and analyzed by means of descriptive analysis. In the second part of the study, scale adaptation was made. A total of 366 adolescents' views were reached about peer bullying. In the evaluation of quantitative findings, package programs were used. As a result of interviews with the teachers, the majority of the teachers who witnessed peer bullying responded that the first sensation was to try to understand the student, and the reasons were academic achievement, physical superiority or inferiority, family life and etc...factors were mentioned as the reasons for the students to push this behavior. Many of the teachers reported that in the face of peer bullying, it would be useful to first talk with the student, guide them to the guidance service, and be in collaboration with the family.

Abstract: *Peer Bullying, Qualitative, Quantitative Study.*

Introduction

Peer bullying is becoming an important problem that many people live, witness or individual cause in nowadays. Peer bullying is mentioned as a type of aggression in studies. Aggression means harmful and dangerous behavior in word definition. (Baron R.A., 1977). There is no universally accepted definition of bullying. Some researchers have seen bullying as 'harm' or 'desire to press someone' (Tattum, 1993). However, researchers admit that bullying involves negative or hurtful behaviors (Olweus, 1993). Most researchers add that, unlike wider definitions of aggression or violence, bullying must also include the concept of power imbalance, in which a less powerful person or group is repeatedly and unjustly attacked. (Rigby, 2002; Ross, 2002). This can be summarized as "systematic abuse of power" (Smith ve Sharp, 1994). Roland has described bullying as "the physical or mental suppression of a person who is strong enough to protect himself or herself, periodically and systematically, by a group that is more effective than itself".

Bullying among children is a major public health problem around the world. Bullying is most commonly defined as a repetitive, intentional aggression that is met by a stronger individual or group with a less powerful victim. It is known that exposure to the bullying is associated with a wide range of mental health problems. Victims are generally more anxious and insecure than other students. Some meta-analysis results show that victimization is linked to problems related to internalization. (Shetgiri, 2013)

Rigby (1999) reported that peer violence is caused by a power imbalance. 'Power imbalance can be in different forms. For example, imbalance may be related to differences in physical strength, verbal dominance of another person, or exclusion from groups. It should also be remembered that the bullying often points to repetitive aggression, or at least to anticipation of repetition of aggression. According to Shetgiri (2014), bullying often occurs in areas far from adult supervision, such as playgrounds and school corridors. Verbal and relational bullying can be more difficult to identify than physical bullying. Relational bullying may be more common among girls and lead to feelings of rejection at a critical time in social development. Compared to students who are bullied in school or out of school, whether they are victims or bullies, are not victims or are exposed to bullying; depression is at a significantly higher risk for serious suicidal thoughts (SSI) and suicide attempts. More frequent bullying behavior (as a victim or bully) increases the likelihood of the student becoming involved in depression or attempting suicide. (Smith, 2011)

Method

Semi-structured interviews with qualitative research methods was used in this research that is (Yıldırım and Şimşek, 2008) defined as "a qualitative research process in which qualitative data gathering methods such as observation, interview, document analysis are used and a qualitative process for revealing perceptions and events in a natural and realistic manner" In the study, the interview form, which was developed in order to determine the opinions of teachers about their experiences about peer bullying, was given the final form in the direction of expert opinions. There are five open-ended questions in the interview form.

Teachers' ideas about peer bullying, problems they faced, and suggestions for solutions were tried to be determined. In the quantitative part, which is the second stage of the research, a scale adaptation study was carried out. In this context, the validity and reliability studies of the "Peer Bullying Scale" developed by (Roberson and Renshaw, 2017) were conducted on the Turkish sample group. The Turkish version of the scale was administered to 366 Turkish adolescents and examined by reliability analysis and confirmatory factor analysis. The compliance indices obtained from confirmatory factor analysis of the scale ($\chi^2 = 223.97$, $sd = 44$, $p = 0.00$, $RMSEA = 0.10$, $NFI = .94$, $NNFI = .94$, $CFI = .95$, $IFI = .95$ and $RFI = .93$, $AGFI = .85$, $GFI = .90$, and $SRMR = .55$) suggest that the one-dimensional model is well suited. Reliability coefficient of the scale was 0.87. The scale consists of 11 items and 1 sub-dimension.

Participants

In the study, the study group was identified by an easily accessible sampling method. In the easily accessible sampling method, "the researcher determines the working area in the environment that is close to him/her in terms of economical and rapid results of the study" (Yıldırım and Şimşek, 2008). With the sampling method that is easily accessible in the research, 10 teachers working in Noksel Elementary School in Sakarya constitute the study group of the research. . There were 9 female and 1 male in the group of the teachers. The average age of teachers is 32.2 and the average age of seniority is 8.4.

Frequency and percentage distributions of the demographic information of teachers participating in the survey are presented in Table 1.

Table 1. Demographic characteristics of interviewed teachers

INTERVIEWERS	AGE	SENIORITY YEAR
Teacher 1	34	11
Teacher 2	25	3
Teacher 3	33	10
Teacher 4	26	3
Teacher 5	39	17
Teacher 6	40	18
Teacher 7	30	8
Teacher 8	27	4
Teacher 9	30	8
Teacher 10	38	2

As seen in Table 1, the average age of teachers participating in the interviews is 32.2 and the average age of seniority of the teachers is 8.4. When the ages of the participants were examined, it was determined that they were between 25 and 40 years of age. When participants' seniority years of employment were examined, it was determined that they were between 2 and 18 years.

Data Collection Tool

In the research, interview form was used as data collection tool. In the preparation phase of the interview questions, the literature was examined and 5 related open-ended questions were prepared and written in the interview form. Open-ended research questions "provide the researcher with a flexible and open-ended approach to the subject they wish to study" (Yıldırım and Şimşek, 2008).

Interviews were held with the teachers in Hendek, who made face-to-face interviews. Interviews were recorded by voice recording device in order to avoid loss of data and then transferred to the article. Verbal permission has been obtained from the teachers on voice recording. During the interview, the teachers responded to the five questions asked to them in response to the experiences they experienced and conveyed their thoughts.

Data Analysis

The data obtained from the interviews were analyzed by descriptive analysis method. Descriptive analysis; (Yıldırım ve Şimşek, 2008), which is composed of four stages: defining a framework for descriptive analysis, processing of data according to thematic framework, identification of findings and interpretation of findings. The thematic framework was defined by researchers for the analysis of data. In this context, the data are first coded separately by each investigator. Later co-codings were made on common themes with the view-union by comparing the data collected.

The written texts resulting from the interviews were reviewed repeatedly, the appropriate data for the purpose of the study was coded, and the themes describing at the general level the encoded data were determined. The findings were arranged in tables. The interviewed teachers were coded from T1 to T10. In the interpretation of the findings, a direct citation was given from the teachers' views.

Findings And Results

This section contains the findings of the research. Teacher views on peer bullying are shown below in tabular form. Table 2 shows the way in which teachers use their means to prevent peer violence.

Table 2. Teachers' views on preventing peer bullying

Theme (Categories)	Codes	n	%
Routes prevent the bullying	Talking to students (T1,T2,T3,T4,T5,T6,T7,T8,T9,T10)	10	100
	Directing Consultation service (T1,T2,T3,T4,T5,T6,T7,T8,T9,T10)	10	100
	Parent cooperation (T1,T2,T3,T4,T6,T7,T8,T9,T10)	9	90

When Table 2 is examined, 100% of the teachers stated that they can avoid these problems with the help of the guidance service, 100% of the teachers, by talking to the student to prevent peer bullying. 90% of teachers reported that they should cooperate with the parent and that this problem could be prevented. A list of individual statements from the teachers' views were given below.

"The first step to prevent a peer bullying is to listen to the child well and get to the root of the problem. If the reasons that push the child to bullying are well-defined, the solution will be so well-defined. In such cases, it directs the child to socialize in more positive environments, keeping away from any situation that would exacerbate the violence. " (T4)

"I would try to understand the emotion that caused the student to speak face-to-face with the student who was doing the bully. I tried to deter him from exhibiting such behavior by telling him that his behavior harmed him and the other person. " (T2)

"I am trying to create a good friendship environment in the classrooms where I am a class counselor. I pay particular attention to the fact that children are not excluded from games. I will intervene instantly as soon as I see the bullying. I try to prevent this issue by reporting to the class teacher first. " (T10)

teachers' views on why bullied people make bullying are presented in Table 3.

Table 3. teachers' views on why bullied people make bullying

Theme (Categories)	Codes	n	%
Reasons for bullying	Physical superiority / defect (T1, T2, T3, T4, T7, T8, T9, T10)	8	80
	Academic success (T1, T2, T3, T4, T5, T7, T10)	7	70
	Family experience (T2, T3, T4, T5, T6, T9, T10)	7	70
	Financial status (T1, T4)	2	20

When Table 3 is examined, 80% of teachers reported that physical reason or physical defect was among the causes of the bullying. And 70% of the teachers stated that academic success is among the reasons for the toughness. Another 70% of the teachers said that this could be the cause of family life, while 20% reported that it was the financial situation. A list of individual statements from the teachers' views are given below.

"Especially the envy of the successful students and the bullying done to the successful person in this direction is the reason I encountered the most. Another reason is that the other person is weaker or smaller than the other person. Particularly stuttering, eyeglass wearers or students with similar physical disadvantages are unfortunately victims of bullying (T10).

"Students often bullied with weak or silent characters. Children who experience violence in the family or those who experience negative consequences of divorce tend to be more inclined. People who are successful in their lessons, or those who have many failures, are another reason to be bullied or exposed. "(T7)

"Domestic violence, violent TV programs, and emotional situations within it can push children into this situation. Especially, they try to solve the problems of children who have lost their self-confidence by bullying. The financial situation is another dimension. "(T4)

"I think amongst the students' bullying reasons is the first feeling of jealousy. Successful students are often exposed to bullying because they are jealous. Children can often be classified as mental and emotional differences, which usually exclude what is different from them. "(T5)

The opinions of the teachers on what measures can be taken to prevent bullying are presented in table 4.

Table 4. Teachers' views on bullying prevention

Theme (Categories)	Codes	n	%
Suggestions for avoiding bullying	Guidance service (T1, T2, T3, T4, T5, T6, T7, T8, T8,T9,T10)	10	100
	Family cooperation (T1, T2, T3, T4, T5, T6, T7, T8, T8,T9,T10)	10	100
	Instilling sense of security (T5, T10)	2	20

When Table 4 is examined, the results of the teachers' opinions on the issue of bullying prevention are pointed out to be directed to the guidance service and the necessity of parental cooperation with a serious rate of 100%. 20% of the teachers stated that students who are exposed to bullying should be instilled with self-confidence in order to make them feel better. The teachers' views are given below.

"I try to talk to the students directly and get in contact to the related departments to prevent the problem. If necessary, I will contact the parent and try to control the child in every area. " (T2)

"The emotional and behavioral problems should be addressed, the family and the teachers should be cooperated, the child should be informed about the possible consequences of doing so and necessary guidance should be given to the students in need." (T3)

"I would like to discuss the problem with the classroom guidance teacher and school guide teacher and take steps in cooperation with the family. I try to make students feel that friendship can be established with those who are instilled with confidence and are bullied." (T10)

"This process must be quite long lasting. The necessary guidance work should be done in cooperation with the family. First of all, we should adopt what are the important virtues of love, compassion, understanding and interest in the home environment." (T9)

The opinions of the teachers about the sanctions imposed by the school administration against bullying are presented in table 5.

Table 5. Teachers' views on school administration sanctions against bullying

Theme (Categories)	Codes	n	%
School administrations' sanctions	Family cooperation (T1, T2, T4, T5, T6, T7)	6	60
	Directing consulting service (T1,T3,T4, T6,T9,T10)	6	60
	Warning (T5,T7,T10)	3	30
	Assigning tasks (T3, T7, T10)	3	30
	Punishments (T7, T10)	2	20

When Table 5 is examined, it is seen that the attitude of the school administration against peer bullying is with the rate of 60%, directed to guidance service and contact with parent. 30% of the teachers reported that administrators were alerted and tried to persuade their students, but 30% of the teachers stated that they were trying to reduce this

feeling of violence by giving certain tasks to the students. 20% of the teachers reported that some punishments were given by the administrations as the last stage. Quotations from the teachers' discourses are given below.

"Our school directs these kinds of students to the guidance service and informs the parents and tries to find solutions." (T4)

"Our school management is constructive towards peer bullying. It is desirable for pupils to come to an agreement among themselves, guided by their teachers. Punishment or similar sanctions are always on the second stage." (T9)

"School management announces to the upper classes that they are the pioneers of the lower classes in particular. He also explains that the upper classes are their brothers and sisters and that they need to protect them. He takes necessary precautions by assigning students against the bullying." (T10)

"Students are warned at regular intervals and recommendations are made for students not to exhibit such behavior.." (T8)

The opinions of teachers about how they react when they see someone who is bullied are presented in table 6.

Table 6. Opinions of teachers when they see someone who is suffering from bullying

Theme (Categories)	Codes	n	%
What they fell when they witness bullying	Empathy (T1,T2,T3,T4,T5,T6,T7,T8,T9)	9	90
	Trying to help (T1,T2,T3,T4,T6,T7,T8,T9)	8	80
	Pretend not to see (T5, T10)	2	20

When Table 6 is examined, 90% of the teachers have indicated that they are trying to understand and empathize the student who is exposed to the bully. 80% of them stated that they tried to help them 50% of the teachers said they were trying to ignore the fact that the student is not a student. Quotations from the teachers' discourses are given below.

"I have long talked about establishing empathy to understand, to be with you, and how to solve this problem together."(T9)

"I have observed that being overprotective, especially during adolescence, is disgraceful for the person who is bullied. It has been seen that the state tried to block emerged another bullying situation, such as mocking. For this reason, I try to wake up the notion that the child who is often in the process of being abused is not informed."(T10)

"I try to empathize with this kind of person and tell him that the situation can be overcome in terms of him. I gave examples of life and information on what should be done in such situations." (T4)

"I said that this situation that the student is experiencing can be experienced by others and I will give him the support that needs to be overcome. (T2)

Quantitative Findings

Participants

The scale study was performed on 366 adolescents. 174 (47%) female and 192 (53%) male students were included in the study. Students in the sample; 80 (21%) students are in the sixth grade, 174 (47%) are in the seventh grade and 112 (32%) students are in the eighth grade. The average age of the sample is 12.3. Bullying Scale (Based on the 2009-2010 report on health behaviors in school children) The bullying relationship among young people has consistently led to serious consequences for both the victims and the bullies. Empirically verified assessment tools are needed for the participation and characterization of adolescents to be used in research and practice.

Bullying Scale (Roberson and Renshaw, 2017), consisting of 11 items and a sub-dimension, is based on Likert with a rating of 5. The scores obtained from this scale are important for the adolescents to reveal the tendency to bully behavior. Scales include social exclusion, physical aggression, spread of lies, various forms of abuse and various types of cyber bullying. Factor loadings of the scale range from .77 to .95. The fit index of the scale χ^2 (208) = 3174.054, $p < .001$; CFI = .971; RMSEA = .053 (90% CI = [.052, .055]); SRMR = .064. Reliability of the original scale. 99.

Results

Item Analysis and Reliability

As a result of the analysis to determine the item separability of the scale, the corrected correlation coefficients were found to vary between .45 and .67. Table 1 shows the results of the analysis.

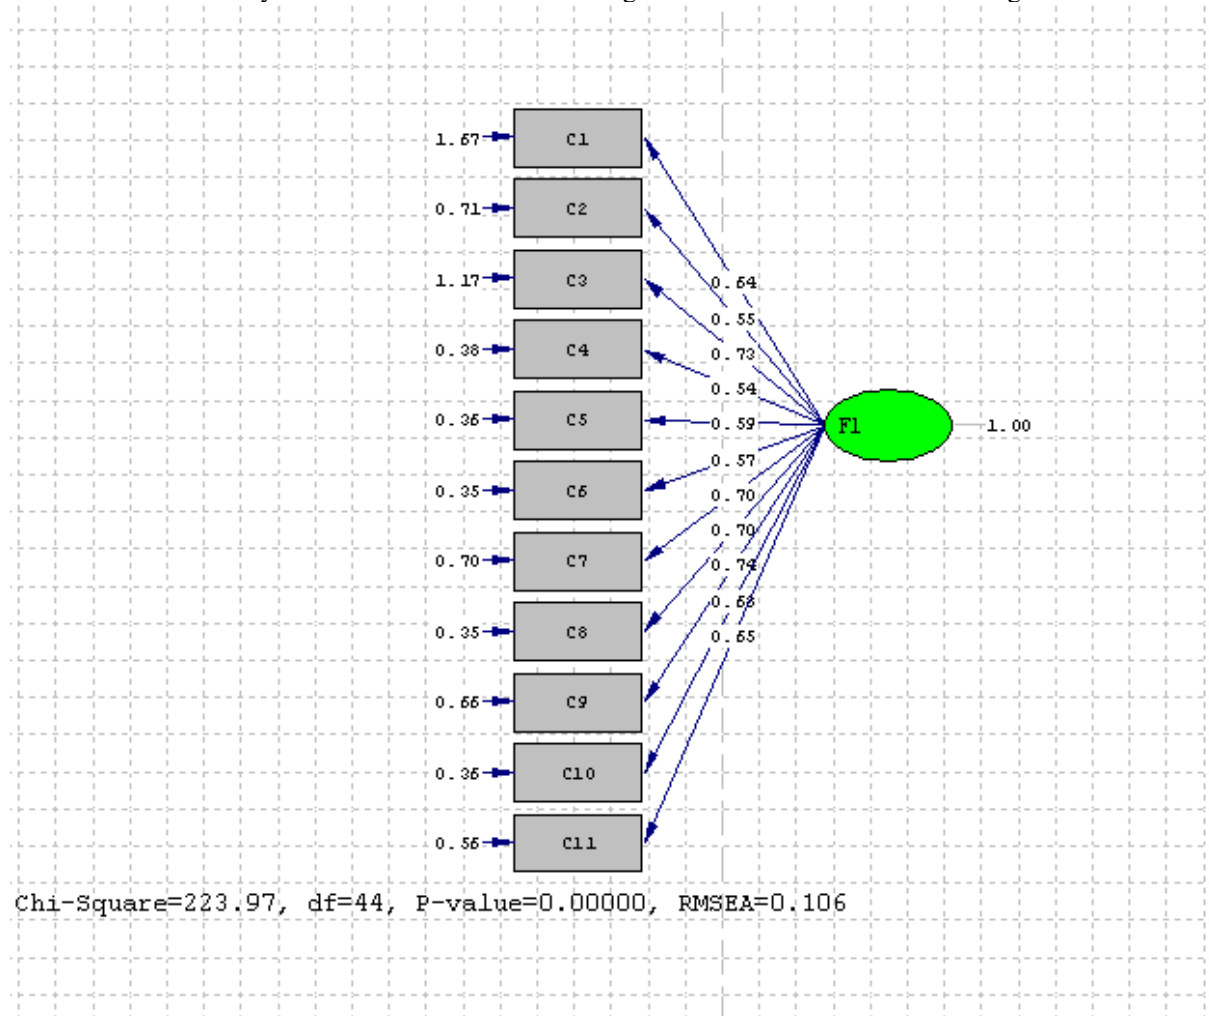

Table 1. Correlation Scores of Peer Bullying Scale Items

Item number	<i>r_{jx}</i>	Item number	<i>r_{jx}</i>
1	.45	7	.61
2	.52	8	.68
3	.56	9	.61
4	.61	10	.67
5	.65	11	.59
6	.63		

For all of the scale, Cronbach's (α) coefficient was found as .87.

Structure Validation

The compliance indices obtained from confirmatory factor analysis of the scale ($\chi^2 = 223.97$, $sd = 44$, $p = 0.00$, $RMSEA = 0.10$, $NFI = .94$, $NNFI = .94$, $CFI = .95$, $IFI = .95$ and $RFI = .93$, $AGFI = .85$, $GFI = .90$, and $SRMR = .55$) suggest that the one-dimensional model is well suited. Standardized regression weights of confirmatory factor analysis are given in figure 1:

Conclusion, Discussion And Recommendations

As a result of the qualitative study, 100% of the teachers stated that they can avoid these problems with the help of the guidance service and talking to the student about preventing peer bullying. 90% of teachers reported that they should cooperate with the parent and that this problem could be prevented. In the study of Holt (2009) on the prevention of bullying, it was reported that the family environment had an effect on the students and that family cooperation was essential for solving these problems. Roberts, (1996), Olweus (1993) found that individuals who had been subjected to bullying in their work were also subjected to pressures in their families, withdrawn to the corners, they are the result of pushing these attitudes, which is why these children are exposed to this behaviour. Parents should be provided with parental education.

80% of the teachers reported that physical reason or physical disability was among the causes of the bullying. And 70% of teachers stated that academic success is among the reasons for the bullying. Glew GM and others (2005) concluded that students' exposure to bullying in school was the first reason for their poor academic achievement. Schwartz (2003) reported that, when academic achievement fell, the risk of being bullied at school increased. In his study, Smokowski, P. R., & Kopasz, K. H. (2005) stated that bullies are more physically superior to the people they bullied, and more active and social in their personality traits. Another 70% of teachers said that this could be the cause of family life, while 20% of teachers reported that the financial situation of the student was also influenced. (Özkan, Çifçi, 2010) have reported that the academic achievement and the financial condition of the student are among the reasons of peer violence in their studies. Similar results have also been reported by Çuhadaroglu et al. (2004), indicating that the income level of the family and, consequently, the decline in educational levels have an effect on children's exposure to bullying. Shetgiri, R. (2013) has achieved results that will support these findings in his work. However, some teachers have expressed the opinion that students who are exposed to bullying should be instilled with self-confidence in order to make them feel better. Olweus (1993) 'The prevention of peer-bullying behaviors in schools is taught by the school guidance service, through a team of all staff (administrators, teachers, psychological counselors and services) in the school, including parents and students, a preventive program should be developed and implemented. In his work Gökler (2009), he reported that the attitude of the school administration towards peer bullying was directed to the guidance service and passed to the parent. Even though the administrators reported that they were trying to persuade their students by warning them, they also stated that they were trying to reduce the feeling of violence by giving certain tasks to the students. Some of the teachers reported that they resorted to punishment when they were desperate. It is indicated in the work done by Gökler (2009) that such punishments should not be implemented with the thought that they could trigger the bully or cause more harm on the victim.

According to other findings of the study, 90% of the teachers stated that they tried to understand the student who was exposed to the bully and empathize. Kallestad and Olweus (2003) describe their ability to empathize as a key factor how teachers characterize and respond to bullying behaviors.

As a result of the study, teachers see the way of talking to students in the case of peer bullying as a method and give guidance to the guidance service in fact show that teachers do not know exactly how to deal with bullying. This result is also striking in other researches. Research has reached the conclusion that neither experienced teachers nor prospective teachers know how to deal with bullying (Bauman and Del Rio, 2006; Yoon and Kerber, 2003). In addition, it has been shown that in the study, teachers need information about how to intervene with physical and verbal bullying, such as naming and physical disagreements (Bauman and Del Rio, 2006).

Limitations of work and suggestions; the qualitative step of the study may examine the opinions of 10 teachers in the province of Hendek in Sakarya, which may result in narrow scope of results. It is suggested that the sample of the study should be wider, and that more teachers and even parents should be consulted in cooperation. Regulation of in-service training programs on peer bullying for teachers may provide positive contributions to school practices. Relational studies on bullying show that school climate is effective. For this reason, the establishment of intervention studies for the entire school can be useful in preventing peer violence. It can be said that the educational activities to be done to the parents will be beneficial both in the appearance of tyrannical behavior and in the prevention of victimization.

Abstract

Peer victimization can have short and long-term serious consequences on children's psychosocial adjustment. Several risk factors for peer bullying and victimization in children have been identified. Children with special needs are at an increased risk of being victimized in school. However, little research has addressed to investigate peer victimization and its relation to psychosocial functioning in children with special needs. The aims of this cross-sectional study were to identify the prevalence rates of peer victimization among students with and without special needs in inclusive classrooms; to compare both groups in terms of the levels of peer victimization; and to examine the relationships of peer victimization with self-esteem and loneliness in students with special needs. A total of 422 students (female=186, male=236) aged 7 to 14 participated in this study. Of these participants, 197 were students with special educational needs (SEN) and 225 were students without special educational needs (non-SEN) attending 2nd-4th grades of primary schools and 5th-6th grades of middle schools. Students' self-reports on peer victimization, self-esteem, and loneliness were collected using the Peer Bullying Scale, the Coopersmith Self-Esteem Inventory, and the Children's Loneliness Scale. In the findings of the study, the overall peer victimization rates were found to be %28 for non-SEN students and %45.6 for SEN students. While the most frequent type of victimization reported by the non-SEN students was verbal victimization, for the SEN students it was being socially isolated. Attack on property was the least common type of peer victimization reported by both groups. The results also revealed that SEN students were more victimized by all types of peer bullying investigated in this study when compared to typically developing students. Additionally, it was found that being socially isolated and physically bullied significantly predicted the self-esteem of SEN students, whereas being isolated and verbally bullied were found to be significant predictors of the feelings of loneliness in these students. The findings of the study were discussed regarding the related literature.

Keywords: *Peer bullying, peer victimization, self-esteem, loneliness, children with special needs*

Introduction

Peer bullying and victimization is a common problem among students in school. Bullying, which is a sub-form of aggression (Kubiszewski, Fontaine, Potard, & Gimenes, 2014), is defined as a situation in which a student is constantly subjected to negative behaviors by one or more people despite the fact that there is no provocation (Olweus, 1997; Piskin, 2003). Increasingly in recent years, it has been indicated that many students are exposed to or perpetrate aggression in school (Olweus, 1993, Piskin, 2003). In order for negative behaviors such as inappropriate physical contact, verbal harassment, spreading rumors, or exclusion to be considered as peer bullying, these behaviors must be repetitive and intentional; and there must be an imbalance in power among peers (Olweus, 1997). While the perpetrator who is bullying is defined as the bully and the one who is being bullied is defined as the victim, some children can be both bully and victim (Kapci, 2004).

The studies investigating peer bullying/victimization at school have revealed different prevalence rates. In a study involving 130,000 students in Norway, it was found that 15% of students aged 8-16 involved in bullying as a bully, a victim, or a bully/victim (Olweus, 1993). Piskin and Ayas (2011) indicated that there were several studies in various countries which have reported that the bullying rates were between 15-25% and the victimization rates were between 6-50%. Within the scope of the World Health Organization's project called "School Age Children's Health", which was carried out in 35 countries, among high school students in Turkey, 22% of them were found to be victims, 9.2% of them were to be bullies and 9.4% of them were both bully/victim (Alikasifoglu, Erginoz, Ercan & Ilter, 2006). In other studies conducted with Turkish children, it was indicated that 35% of primary school students were found to be victims, 30.2% were to be bullies, and 6.2% were both bullies/victims (Piskin, 2003) and about 40% of 4th and 5th grade students were exposed to peer bullying (Kapci, 2004).

Bullying can be either direct or indirect towards peers. Direct bullying consists of acts of physical violence, insults, humiliation, hand gestures, and ugly gesture mimicry whereas behaviors such as isolation, exclusion, and spreading rumor are called indirect bullying (Hong & Espelage, 2012). Indirect bullying is also referred to as "social bullying" since it involves "non-verbal aggression" (Underwood, 2003) or as "relational bullying" (Crick & Bigbee, 1998). Students who are directly exposed to bullying may know who the bully is, however in indirect bullying victim often does not know who the bully is and can only guess. This situation leads to difficulties in the identification and intervention of the peer bullying (Gultekin, 2003). Bullying behaviors have also been classified into different subcategories according to its form and characteristics in order to identify the peer bullying more clearly and to increase the effectiveness of the interventions. The most accepted classification in the literature is Olweus' (1993) classification which consists of three types of bullying such as physical bullying, social exclusion, and verbal bullying. Also, Mynard and Joseph's (2000) classification consists of four types of bullying; physical, verbal, relational, and attacks on personal belongings whereas Elliott (1997) defined four types of bullying as physical, verbal, emotional, and threatening. Moreover, Piskin (2005) described five types of bullying such as physical bullying, verbal bullying, isolation, rumor spreading, and attacks on property. In addition to these traditional types of bullying, studies on sexual bullying (Piskin and Ayas, 2005) and cyber bullying (Aydın-Gorucu, 2016) have also been conducted in the following years.

Several studies have revealed different prevalence rates for each type of peer bullying. Vlachou, Botsoglou and Andreou (2014) indicated that the prevalence rates are between 28-53% for physical bullying and social exclusion; between 12-50% for verbal bullying; and between 1.2-32.4% for rumor spreading. In a recent study conducted with 425 students aged 6-9 in the United States, 19.18% of children experienced direct bullying and 20.87% of them experienced indirect bullying (Studt & Renner, 2014). In another study conducted with 2,500 children in Sweden, it was determined that children were exposed to physical bullying most frequently (57.6%) and sexual bullying least frequently (11.0%) (Miller-Graff, Cater, Howell, & Graham-Bermann, 2015). Pellegrini (2002) stated that males are more likely to experience physical bullying and females are more likely to experience relational and indirect bullying. In several studies in Turkey, it is determined that victims are exposed to physical and verbal bullying most frequently and to emotional and sexual bullying least frequently (Çinkır & Karaman-Kepeneci, 2003; Kapci, 2004). In the study of Çinkır and Karaman-Kepeneci (2003), the peer victimization rates were found to be 44% for verbal bullying, 30% for physical bullying, 9% for sexual bullying, and 1% for emotional bullying. In a study conducted by Piskin (2003), 34% of the victims were found to be physically bullied, 29% to be verbally bullied, 21% to be exposed to indirect bullying and 11% to be exposed to property damage. In another study, it was found that students were exposed to pushing (63%) at the most, following by swearing (57%), name calling (56%), teasing (49%), damaging property (45%), and rumor spreading (%44) (Yurtal & Cenkseven, 2006).

In recent years, there has been an increasing effort in examining the relationship between peer victimization and psychosocial adjustment of children. Related studies indicate that peer victimization can have short- and long-term negative consequences for children's psychosocial adjustment (see Wolke & Lereya, 2015, for a review). Studies have shown that children/adolescents who are victimized tend to have lower self-esteem (Juvonen, Nishina, & Graham, 2000; Kapci, 2004; Piskin & Ayas, 2005), experience more peer rejection (Pekel-Uludagli & Ucanok, 2005) and loneliness (Boivin, Hymel, & Bukowski, 1995; Graham & Juvonen, 1998; Storch & Masia-Warner, 2004), have higher levels of anxiety and depression (Juvonen, Graham, & Schuster, 2004; Kapci, 2004; Fleming & Jacobsen, 2009), and have more frequent school related problems (Çinkır, 2006; Karaca, 2018).

Findings of the studies on consequences of peer bullying have led researchers to investigate the risk factors associated with the bullying involvement (as a bully, as a victim, or as a bully/victim). In these studies, personal characteristics such as gender, age, grade, and ethnicity have been examined as well as social contexts such as family, peer group, and school, and various psychosocial variables in relation to bullying involvement (see, Craig, Peters, & Konarski, 1998; Dake, Price, & Telljohann, 2003; Card and Hodges, 2008, for reviews). It was indicated that bullies had a negative family environment, had a tendency to be delinquent and substance abuse, were aggressive, had problems in social relations, and had low academic achievement. On the other hand, the review articles mentioned above also reported that victims were tend to be physically weak and were not able to protect themselves, they were more sensitive, shy, had difficulties in social relations, had lower self-esteem and social competence, experienced internalizing problems such as loneliness, depression, anxiety, and also displayed some externalizing problems such as hyperactivity and emotional dysregulation.

When the risk factors identified for peer victimization among typically developing children mentioned earlier are taken into consideration, it is reasonable to state that children with disabilities or special educational needs are at an increased risk for peer victimization in school. Some circumstances associated with the disability (e.g. visibility of disability; Rose, Monda-Amaya, & Espelage, 2011), and the social and behavioral characteristics of children with special needs such as social skills deficits, behavioral problems, difficulties in peer relations (Kucuker &

Cifci-Tekinarslan, 2015), and peer rejection (Kavale & Forness, 1996) may leave them vulnerable to peer bullying/victimization. Baumeister, Storch, and Geffken (2008) reported that peer victimization was also positively correlated with thought problems, attention problems, disruptive behavior, and social problems of children with learning disabilities. Research indicated that the peer victimization rate among children with special needs was higher than typically developing peers (Bear, Mantz, Glutting, Yang, & Boyer, 2015; Wiener & Mak, 2009). In a recent review of studies on peer bullying and victimization among students with special needs (Rose et al., 2011), the victimization rates were reported to be in excess of 50% which indicated that children with special needs became targets of peer victimization more frequently than their typical peers.

In the literature, although there have been a considerable number of studies on peer bullying and victimization among typically developing children, empirical studies investigating this topic in children with special needs are still rather limited. In Turkey, there have also been only a few studies on peer victimization of children with special needs (Orengul, 2013, Aydın-Gorucu, 2016). Studies involving children with special needs have focused on examining the differences in peer bullying and victimization rates among these children regarding the type and severity of their disability, different educational settings, and also comparing their bullying and victimization rates with those of typical peers (see Rose et al., 2011; Sentenac et al., 2012, for reviews). However, there is a need for further research on peer victimization and its relation to psychosocial adjustment in children with special needs since there have been a limited number of studies on this subject. Therefore, the aims of this study are to identify the types and prevalence of peer victimization among students with and without special needs in inclusive classrooms, to compare both groups in terms of the levels of various peer victimization types, and to examine the relationships of peer victimization with self-esteem and loneliness, as indicators of psychosocial adjustment, in students with special needs. The results of this study may add valuable information to guide the planning of appropriate anti-bullying interventions for children with special needs.

Answers to the following questions are sought in the study:

- 1) What are the types and prevalence rates of peer victimization among students with and without special educational needs in inclusive primary and middle school classrooms?
- 2) Are there any significant differences between students with and without special educational needs in inclusive classrooms in terms of the levels of peer victimization types they experience?
- 3) Are the various types of peer victimization significant predictors of self-esteem of students with special educational needs in inclusive classrooms?
- 4) Are the various types of peer victimization significant predictors of loneliness levels of students with special educational needs in inclusive classrooms?

Method

Participants

Students with and without special educational needs (SEN students, $n=197$; non-SEN students, $n=225$) from 2nd, 3rd, and 4th grades of regular primary schools and from 5th and 6th grades of regular middle schools in the province of Denizli, Turkey participated in this cross-sectional study. Of these 422 students, 186 were female (44.1%) and 236 (55.9%) were male. A hundred and three of the students were in the 2nd grade, 92 were in the 3rd grade, 79 were in the 4th grade, 61 were in the 5th grade, and 87 were in the 6th grade. The ages of the non-SEN students are between 7-13 ($x = 10.02$, $sd = 1.468$) and the ages of the SEN students are between 7-14 ($x = 9.79$, $sd = 1.595$). Non-SEN students that participated in the study as a comparison group were recruited from a total of 15 classes in 3 primary and 3 middle schools that were randomly selected from schools in the province of Denizli in order to represent different socio-economic levels. On the other hand, a sufficient number of SEN students can be recruited from a large number of primary and middle schools because of the small number of special needs students attending inclusive classrooms in regular schools. Based on the information gathered from the teachers, SEN students who have gained literacy skills were included in the study. A total of 111 (56.3%) of the SEN students were diagnosed with learning disability, 78 (39.6%) were diagnosed with mild intellectual disability, and 8 (4.1%) with autism spectrum disorder according to the assessment procedures officially done by Guidance and Research Centers. Demographic characteristics of the SEN and non-SEN students are presented in Table 1.

Table 1. *Demographic Characteristics of the Students with and without Special Needs*

		SEN* Students ($n=197$)		non-SEN** Students ($n=225$)	
		n	%	n	%
Gender	Female	77	39.1	109	48.4
	Male	120	60.9	116	51.6
Grade	2	59	29.9	44	19.6
	3	44	22.3	48	21.3
	4	36	18.3	43	19.1

	5	23	11.7	38	16.9
	6	35	17.8	52	23.1
Type of disability	Learning disability	111	56.3		
	Intellectual disability	78	39.6		
	Autism spectrum disorders	8	4.1		

*SEN: Students with special needs

**non-SEN: Students without special needs

Measures

Peer Bullying Scale-Child Form, Coopersmith Self-Esteem Inventory, Children's Loneliness Scale and a demographic information questionnaire were used to collect data in the study.

Peer bullying/victimization scale (PB/VS): In this study, the Peer Bullying/Victimization Scale (PB/VS)-Child Form developed by Piskin and Ayas (2007, 2011) was used to assess the victimization experienced by students with and without special needs. The PB/VS has both child and adolescent forms. In both forms, participant is responding to the same items in two separate dimensions. The children are instructed to answer how often they are bullied by other children in the first dimension (the Victim Scale-VS) and how often they bully others in the second dimension (the Bully Scale-BS). In the PB/VS, bullying behaviors described under five categories as follows: physical bullying (hitting, kicking, pushing etc.), verbal bullying (insulting, calling names, making fun of somebody, teasing, swearing etc.), isolation/ exclusion (isolating, ignoring etc.), rumor spreading (telling bad things behind their back, telling false stories etc.), and attack on property (taking things or money, stealing, deliberately damaging property of others etc.). There are a total of 37 items in the PB/VS-Child Form. A short explanation is given about what bullying or being bullied means on the first page of the instrument. Children are asked to respond to the scale items on a five-point scale for each dimension: "almost every day=4", "at least once a week=3", "once a month=2", "once a term=1" or "never=0" (Piskin & Ayas, 2011). The total score ranges from 0 to 148, with higher scores indicating higher levels of peer bullying /victimization. Piskin and Ayas (2011) conducted confirmatory factor analysis (CFA) to examine the construct validity of the PB/VS-Child Form in students attending 3rd, 4th, and 5th grades; the results showed that the five-factor model was confirmed for both the VS and the BS subscales. The Cronbach's alpha coefficients for the VS and the BS scales were found to be .90 and .87, respectively. In the current study, only the Victim Scale (VS) was used to assess the peer victimization of the SEN and non-SEN students, and Cronbach's alpha coefficient for the SEN students was calculated as .93 (n=197) and for the non-SEN students as .87 (n=225).

Coopersmith Self-Esteem Inventory (CSEI): The Coopersmith Self-Esteem Inventory (CSEI, Coopersmith, 1991) was used to assess global self-esteem of the SEN students. There are many studies that support the validity and reliability of the widely used CSEI to evaluate the self-esteem of children and adolescents that are older than 8 years of age (Coopersmith, 1991; Piskin, 1996). Eight out of 58 items in the CSEI are indicative of defensive attitudes (the lie subscale) and are not included in the scoring. Participants are asked to respond to scale items in the form of "like me" or "unlike me". Responses pointing to high self-esteem are given 1 point, and those pointing to low self-esteem are given 0 point. A total score (a global self-esteem evaluation) and five subscale scores (General Self-esteem, Social-Peers Self, Home-Parents, School-Academic, and Lie) are obtained from the scale (Piskin, 1996). Scores ranged from 0 to 50, and the increase in points indicates higher self-esteem (Kapci, 2004). It is suggested that CSEI can be used for assessment in both primary schools (with 3rd, 4th, and 5th grade students; Gucray, 1989) and high schools (Piskin, 1996). The internal consistency coefficient of the scale was found to be higher than .80 and the test-retest reliability coefficient of .70 was obtained with an interval of two-weeks in the study conducted by Gucray (1989) with children of various ages and genders. In the same study, the correlation of the CSEI with the Piers-Harris Self-Concept Scale was found to be .72. In the present study, the Cronbach alpha coefficient of the CSEI was found to be .87 for the SEN students (n = 197).

Children's Loneliness Scale (CLS): In this study, The Children's Loneliness Scale (CLS) was used to assess the loneliness levels of SEN students. Asher, Hymel and Renshaw (1984) developed the CLS to evaluate 3rd-6th graders' levels of loneliness and dissatisfaction from social relationships, and Asher and Wheeler (1985) had made modifications in some of the items of the CLS in order to reflect school-based loneliness (e.g. 'I feel alone at school' instead of 'I feel alone'). The scale has 24 items, 16 of them are related to the feelings of loneliness, perceptions of social competence, and status among peers. The CLS includes eight "filler" items that focus on hobbies and interests (e.g., "I like music") and are not to be included in the scoring. The children respond to the items on a five-point scale (always true = 5, not true at all = 1). The total scores ranged from 16 to 80, and higher scores indicate higher levels of loneliness (Cifci-Tekinarslan & Kucuker, 2015). Several studies have reported that the CLS consisted of a single factor (Asher & Wheeler, 1985; Cassidy & Asher, 1992; Kaya, 2005; Cifci-Tekinarslan & Kucuker, 2015.) The internal consistency coefficients of CLS are reported as .78-.90 (Asher et al., 1984; Galanaki, Polychronopoulou & Babalis, 2008; Kaya, 2005). In Turkey, the psychometric properties of the

CLS were investigated on the typically developing students attending 3rd-8th grades (Kaya, 2005), and on the 4th-5th graders with and without special needs (Cifci-Tekinarslan & Kucuker, 2015). In these studies, CLS has demonstrated a one-factor structure; high internal consistency ($\alpha = .87$) and test-retest reliability (.76-.87). In the present study, the Cronbach alpha coefficient of the CLS was found to be .88 for the SEN students ($n = 197$).

Procedure

At the spring semester of the 2017-2018 school year, a list of primary and middle schools that have students with special needs and legal permission to conduct the study were obtained from the National Education Directorate. Information about the purpose of the present study was given to the school principals and teachers of primary and middle schools that were randomly selected from the regions, representing different socio-economic levels of the province of Denizli, and their approvals for the study were obtained. Also, participating students were informed about the study before the administration of the instruments. It is stated that students will be asked some questions about themselves, about their friendships, and about the difficulties they may have in school, that information they are going to give will be confidential, and participation in this study is voluntary. Non-SEN students filled in self-reported instruments in their own class as a group. For SEN students, the instruments were individually administered by the researchers in an out-of-class environment and necessary explanations and assistance were provided to the students who requested it. After the administration of the instruments was finished, the students were thanked for their participation.

Data Analysis

Concerning the first question of the study, descriptive statistics such as frequency and percentage, were calculated to find out the prevalence of the types of peer victimization for the SEN and non-SEN students. In order to determine whether the both groups differed in the levels of peer victimization types, the VS total and subscales scores of both groups were examined regarding the assumptions of parametric tests. The results of the Levene's test showed that variances for the VS total and subscales scores of SEN and non-SEN students were not equal. The distributions of the VS scores for both groups were also checked for normality assumptions. Skewness and kurtosis values for the VS scores of non-SEN students were found to be higher than 1 indicated that the scores did not normally distributed. Therefore, the non-parametric Mann Whitney-U test for unrelated samples was used to compare the VS scores of SEN and non-SEN students. To address the third and fourth questions of the present study, analyzes were conducted with the group of SEN students ($n=197$). Stepwise multiple regression analyzes were performed to determine the predictive powers of the types of peer bullying victimization on self-esteem (CSEI total score) and loneliness levels of SEN students. Prior to the analysis, the data sets related to self-esteem and loneliness of SEN students were examined for the assumptions of multiple linear regression analysis. The outliers were examined via calculation of Mahalanobis distance values, and no outlier was found in both data sets. Pearson correlation coefficients between the predictive (independent) variables, tolerance values, and VIF (variance inflation factor) values indicated that there was no multicollinearity among predictive variables (Cokluk, Sekercioglu, and Buyukozturk, 2014). Based on these findings, the data were analyzed using a stepwise multiple linear regression method.

Results

The findings of the research questions are presented in this section.

1. Types and Prevalence Rates of Peer Victimization among Students with and without Special Needs

In order to find out the types and the prevalence rates of bullying behaviors experienced by primary and middle school students with and without special needs in inclusive classrooms, the frequencies and percentages of the students' responses to the items in the VS subscales were calculated. The findings are presented in Table 2.

Table 2. *The prevalence rates of bullying behaviors experienced by SEN and non-SEN students*

Types of bullying	Bullying behaviors	SEN Students	Non-SEN Students
		n (%)	n (%)
Physical bullying	1. Attacking with cutting instruments	20 (10.2)	8 (3.6)
	2. Stabbing with sharp objects	35 (17.8)	39 (17.3)
	3. Kicking or punching	75 (38.1)	81 (36.0)
	4. Hitting with an object	57 (31.0)	37 (16.4)
	5. Pushing with shoulder, hitting with elbow	88 (44.7)	83 (36.9)
	6. Pulling hair or ears, pinching or biting	95 (48.2)	65 (28.9)
	7. Pulling down by pushing or twisting arms	82 (41.6)	42 (18.7)
	8. Throwing objects or water	111 (56.3)	73 (32.4)
	9. Disturbing by touching with hands or tickling	126 (64.0)	117 (52.0)

	10. Putting an uncomfortable object underneath	48 (24.4)	30 (13.3)
	Physical victimization	37.6%	25.5%
	11. Swearing or telling insulting words like stupid, idiot etc.	121 (61.4)	110 (48.9)
Verbal bullying	12. Unpleasant name-calling	117 (59.4)	106 (46.1)
	13. Making fun about physical appearance	94 (47.8)	61 (26.1)
	14. Making fun of accent, pronunciation or stuttering	81 (41.1)	42 (18.7)
	15. Teasing or annoying him/her	147 (74.6)	137 (60.9)
	16. Threatening	74 (36.0)	52 (23.1)
	Verbal victimization	53.4%	37.3%
Isolation	17. Doesn't include in games	122 (61.9)	116 (51.6)
	18. Isolating, not accepting in the group	117 (59.4)	66 (29.3)
	19. Not speaking to, not answering to questions	118 (59.9)	89 (39.6)
	20. Prevent other students making friends with	88 (44.7)	29 (12.9)
	21. Deliberately not giving the pass, while playing football	113 (57.4)	80 (35.6)
	Victimization by isolation /exclusion	56.7%	33.8%
Rumor spreading	22. Spreading rumors/gossip	78 (41.6)	66 (29.3)
	23. Accusing for things he/she hasn't done	100 (50.8)	72 (32.0)
	24. Undermine relationship among friends by spreading gossips	72 (36.6)	63 (28.0)
	25. Writing ugly words about him/her	59 (29.9)	39 (17.3)
	26. Complaining to teacher for something he/she hasn't done.	129 (65.5)	45 (20.0)
	27. Telling someone's secrets to others	76 (38.6)	53 (23.6)
	28. Snitching	127 (64.5)	77 (34.2)
	Victimization by rumor spreading	46.8%	26.4%
Attack on property	29. Taking his/her money or belongings forcibly	23 (26.9)	19 (8.4)
	30. Stealing his/her money or belongings	40 (20.3)	21 (9.3)
	31. Purposefully damage to his/her belongings	80 (39.6)	48 (21.3)
	32. Scribble or blacken books or notebooks	110 (55.8)	57 (25.3)
	33. Taking someone's ball and run away	96 (48.7)	66 (29.4)
	34. Tearing or soiling the clothes	48 (24.4)	20 (8.9)
	35. Sneaking through his/her bag or personal items	56 (29.0)	38 (16.9)
	36. Forcing to buy goods from the canteen	44 (22.3)	24 (10.7)
	37. Not giving back the borrowed money / items	68 (34.5)	47 (20.9)
	Victimization by attack on property	33.5%	16.8%
	Overall victimization	45.6%	28%

*SEN: Students with special needs

**non-SEN: Students without special needs

As seen in Table 2, while the overall victimization rate was found to be 28% for non-SEN students, it was found as 45.6% for SEN students. These results indicated that more than one-quarter of the non-SEN students and about half of the SEN students experienced some forms of peer bullying at frequencies varying from “once a term” to “almost every day”. Similar to the overall victimization rate, the SEN students' rates of victimization by isolation (56.7% vs. 33.8%), verbal bullying (53.4% vs. 37.3%), rumor spreading (46.8% vs. 26.4%), physical bullying (37.6% vs. 25.5%), and attacks on property (33.5% vs. 16.8%), were higher than the rates of non-SEN students. The most frequent type of peer victimization reported by non-SEN students was by verbal bullying, followed by isolation, rumor spreading, physical bullying, and attacks on property. On the other hand, the most common type of peer victimization reported by SEN students was victimization by social isolation/exclusion, followed by verbal bullying, rumor spreading, physical bullying, and attacks on property. The attacks on property was the least common type of peer victimization experienced by both SEN and non-SEN students. Among the verbal bullying behaviors, both of SEN and non-SEN students reported that they were subjected to teasing, annoying, swearing, name-calling or insulting (words like stupid, silly or idiot, etc.) the most frequently. In terms of the isolation dimension, while about half of the non-SEN students only reported that they were not taken into the games (51.6%), more than half of the SEN students reported that they were not taken into the games (61.9%), they were not talked to (59.9%), and they were not accepted to the group (59.4%). Among the rumor spreading behaviors, while non-SEN students reported most frequently that they were exposed to snitching (34.2%), majority of the SEN students reported most frequently that they were subjected to snitching (64.5%) and complaining to the teacher (65.5%). It was found that both SEN and non-SEN students were most exposed to disturbing by touching with hands or tickling among physical bullying behaviors. In *attacks on property* dimension, it was found that SEN students were more exposed to scribbling or blackening books or notebooks.

2. Comparison of the Students with and without Special Needs Regarding the Levels of Peer Victimization Types

The second objective of the study was to determine whether there were significant differences between students with and without special needs regarding the levels of peer victimization types. For this purpose, the Victimization Scale total scores and the subscales scores of the two groups were compared with the non-parametric Mann-Whitney U test for unrelated samples. Descriptive statistics of the SEN and non-SEN students' Victimization Scale scores by bullying types are presented in Table 3, and the results of Mann Whitney-U test are presented in Table 4.

Table 3. Descriptive Statistics of the VS Total Scale and Subscale Scores of the SEN* and non-SEN** Students

Variables	SEN Students (n=197)		non-SEN Students (n=225)	
	x	sd	x	sd
Physical bullying	7.15	6.80	5.04	5.42
Verbal bullying	7.71	5.63	5.70	4.97
Isolation	6.69	5.10	3.80	3.49
Rumor spreading	7.12	5.86	3.50	4.30
Attacks on property	5.95	6.40	2.70	3.34
VS total scale	34.63	23.99	20.74	16.17

*SEN: Students with special needs

**non-SEN: Students without special needs

As seen in Table 4, significant differences were found between the students with and without special needs in terms of the victimization by physical bullying ($U = 18289.50$, $p = .002$), verbal bullying ($U = 1.75$, $p = .000$), isolation ($U = 1.49$, $p = .000$), rumor spreading ($U = 1.35$, $p = .000$), attacks on property ($U = 15271.50$, $p = .000$) and the VS total scale ($U = 1.44$, $p = .000$). Compared to non-SEN students, SEN students reported more victimization of verbal bullying, physical bullying, isolation, rumor spreading, attacks on property, and overall victimization.

Table 4. Mann Whitney-U Test Results to Compare the VS Total and Subscales Scores of the SEN* and non-SEN** Students

Variables	SEN Students (n=197)		non-SEN Students (n=225)		U	z	p
	Mean rank	Sum of Ranks	Mean Rank	Sum of Ranks			
Physical bullying	231.16	45538.5	194.29	43714.5	18289.5	-3.12	.002
Verbal bullying	235.10	46314	190.84	42939.0	1.75	-3.73	.000
Isolation	248.40	48935.5	179.19	40317.5	1.49	-5.85	.000
Rumor spreading	255.47	50328	173.00	38925.0	1.35	-6.99	.000
Attacks on property	246.48	48556.5	180.87	40696.5	15271.5	-5.59	.000
VS total scale	250.87	49420.5	177.03	39832.5	1.44	-6.20	.000

*SEN: Students with special needs

**non-SEN: Students without special needs

3. The role of peer victimization in predicting self-esteem of students with special needs

A stepwise regression analysis was conducted to determine the predictive powers of the types of peer bullying victimization on self-esteem of SEN students in inclusive classrooms. The relationships between the independent variables (*physical bullying, verbal bullying, isolation, rumor spreading and attacks on property*) and the dependent variable (*self-esteem*) were examined by the Pearson product moment correlation analysis and the correlation coefficients obtained are presented in Table 5.

Table 5. Correlations between Self-Esteem and Independent Variables

Variables	1	2	3	4	5	6	7
1. Physical bullying	-						
2. Verbal bullying	.50**	-					
3. Isolation	.40**	.56**	-				
4. Rumor spreading	.55**	.65**	.57**	-			
5. Attack on property	.65**	.54**	.52**	.65**	-		
6. VS total score	.79**	.80**	.74**	.84**	.85**	-	

7.CSEI Global self-esteem	-.33**	-.35**	-.50**	-.38**	-.35**	-.47**	-
---------------------------	--------	--------	--------	--------	--------	--------	---

N=197, p<0.01

As seen in Table 5, there was a significant negative correlation between the CSEI global self-esteem and the VS total score of SEN students ($r=-.47$, $p<.01$). While the highest negative correlation was found between isolation and self-esteem ($r=-.50$, $p<.01$); rumor spreading ($r=-.38$, $p<.01$), verbal bullying ($r=-.35$, $p<.01$), attacks on property ($r=-.35$, $p<.01$), and physical bullying ($r=-.33$, $p<.01$) also showed significant relationships with self-esteem negatively. As the VS total score had correlations greater than .70 with the Victimization subscales, the VS total score was not included in the regression analysis, only the subscale scores of physical bullying, verbal bullying, isolation, rumor spreading, and attacks on property were taken.

Stepwise multiple regression analysis was performed to determine the predictive powers of independent variables on self-esteem of SEN students. As seen in Table 6, the variables *verbal bullying*, *rumor spreading*, and *attacks on property* were not processed in stepwise regression analysis because they did not significantly predict the self-esteem of the SEN students, hence the other two variables, *isolation* and *physical bullying* were included into the regression model. In the first step of the analysis, the *isolation* variable was introduced to the regression model. The standardized regression coefficient for the *isolation* variable in predicting the self-esteem of SEN students was found as $\beta=-.502$. The *isolation* variable significantly predicted the self-esteem of SEN students ($t=-8.114$, $p<.01$), and explained 25% of the total variance of the self-esteem scores alone ($R^2=.252$, $F_{\text{reg}}(1,195) = 65.840$, $p=.000$).

Table 6. Stepwise Regression Analysis Results to Predict Self-Esteem of Students with Special Needs

Model	B	Std. error	β	t	p	Zero-order r	Partial r	R	R ²	F
1 (constant)	37.461	.870		43.08	.000			.502	.252	65.84**
Isolation	-.839	.103	-.502	-8.11	.000	-.502	-.502			
2 (constant)	38.126	.911		41.84	.000					
Isolation	-.738	.112	-.442	-6.60	.000	-.502	-.428	.521	.271	36.07**
Physical bullying	-.187	.084	-.149	-2.23	.027	-.328	-.158			

**p<.01

In the second step of the Stepwise regression analysis, the *physical bullying* variable was included into the model. When the other variables explaining self-esteem held constant, the variables *isolation* and *physical bullying* together explained 27% of the total variance in the self-esteem scores ($R^2=.271$, $F_{\text{reg}}(2,194) = 36.072$, $p = .000$). According to these results, the *physical bullying* variable made a significant contribution to the total variance of the self-esteem scores by about 2% ($\Delta R^2=.019$, $F_{\text{change}}(1,194) = 4.965$, $p=.000$). In this step, the standardized regression coefficients in predicting the self-esteem of SEN students were found to be $\beta = -.442$ for the *isolation* variable and $\beta=-.149$ for the *physical bullying* variable. Isolation/exclusion by peers ($t=-6.60$, $p=.000$) and exposure to physical bullying ($t=-2.23$, $p=.027$) significantly predicted the self-esteem of SEN students. It was found that the most important predictor of self-esteem was *isolation*, followed by *physical bullying*, and both variables were negatively related to self-esteem.

4. The role of peer bullying on predicting loneliness levels of students with special needs

A stepwise regression analysis was performed to determine the predictive powers of the types of bullying victimization on loneliness levels of SEN students in inclusive classrooms. Prior to the regression analysis, the relationships between the types of bullying victimization (independent variables) and loneliness (dependent variable) were examined by the Pearson product moment correlation analysis and the correlation coefficients obtained are presented in Table 7.

Table 7. Correlations between Loneliness and Independent Variables

Variables	1	2	3	4	5	6	7
1. Physical bullying	-						
2. Verbal bullying	.50**	-					
3. Isolation	.40**	.56**	-				
4. Rumor spreading	.55**	.65**	.57**	-			
5. Attack on property	.65**	.54**	.52**	.65**	-		

6.VS total score	.79**	.80**	.74**	.84**	.85**	-	
7.Loneliness	.33**	.42**	.53**	.40**	.35**	.50**	-

N=197 p<.01

As seen in Table 7, there was a significant positive correlation between the loneliness and the VS total score of SEN students ($r=.50, p<.01$). When the subscales were examined, the highest correlation with loneliness was found between *isolation* score ($r=.53, p<.01$) and *verbal bullying* score ($r=.42, p<.01$); *rumor spreading* ($r=.40, p<.01$), *attacks on property* ($r=.35, p<.01$), and *physical bullying* ($r=.33, p<.01$) also showed significant relationships with loneliness positively. As the VS total score had correlations greater than .70 with the VS subscales, the VS total score was not included in the regression analysis, only the subscale scores of *physical bullying*, *verbal bullying*, *isolation*, *rumor spreading*, and *attacks on property* were taken. Stepwise multiple regression analysis was performed to determine the predictive powers of independent variables on the loneliness levels of SEN students and the results are given in Table 8.

Table 8. Stepwise Regression Analysis Results to Predict Loneliness in SEN Students

Model	B	Std. Hata	β	t	p	Zero- order r	Partial r	R	R ²	F
1 (constant)	28.664	1.149		24.94	.000			.533	.284	77.38**
Isolation	1.202	.137	.533	8.79	.000	.533	.533			
2 (constant)	27.372	1.250		21.89	.000					
Isolation	.975	.163	.432	5.97	.000	.533	.394	.553	.306	42.72**
Verbal bullying	.364	.148	.178	2.46	.015	.328	.174			

**p<.01

As seen in Table 8, the variables *physical bullying*, *rumor spreading*, and *attacks on property* were not included in the stepwise regression analysis because they did not significantly predict the loneliness in SEN students, hence the other two independent variables, *isolation* and *verbal bullying* were included into the regression analysis. In the first step of the analysis, the *isolation* variable was introduced to the regression model. The standardized regression coefficient for the *isolation* variable in predicting the loneliness levels of SEN students was found as $\beta=.533$. The *isolation* variable significantly predicted the loneliness levels of SEN students ($t=8.79, p<.01$), and explained 28.4% of the total variance of the loneliness scores alone ($R^2=.284, F_{reg}(1,195)=77.38, p=.000$).

In the second step of the stepwise regression analysis, the *verbal bullying* variable was included into the model. When the other variables explaining loneliness were held constant, the variables *isolation* and *verbal bullying* together explained 30.6% of the total variance in the loneliness scores ($R^2=.306, F_{reg}(2,194)=42.72, p=.000$). According to these results, the *verbal bullying* variable made a significant contribution to the total variance of loneliness scores by 2% ($\Delta R^2=.022, F_{change}(1,194)=6.054, p=.000$). In this step, the standardized regression coefficients in predicting the loneliness levels of SEN students were found to be $\beta=.432$ for the *isolation* variable and $\beta=.178$ for the *verbal bullying* variable. Isolation/exclusion by peers ($t=5.97, p=.000$) and exposure to verbal bullying ($t=2.46, p=.015$) significantly predicted the loneliness levels of SEN students. When the relative importance of the predictive variables on loneliness was examined according to the standardized regression coefficient (β), it was found that the most important predictor of loneliness was the *isolation* variable, followed by *verbal bullying*, and both variables were positively correlated with loneliness.

Discussion

In this study, firstly the prevalence of peer victimization in students with (SEN) and without special needs (non-SEN) in inclusive classrooms were examined and then two groups were compared in terms of the levels of various peer victimization forms they experienced. Additionally, the predictive relationships of different types of peer victimization with self-esteem and loneliness levels of students with special needs were investigated. When the overall peer victimization rates for SEN students and non-SEN students were examined, the results indicated that more than a quarter of non-SEN students (28%) and about half (45.6%) of SEN students with special needs were exposed to some forms of peer bullying. As well as the overall rate of peer victimization, SEN students were found to have higher rates of victimization by social isolation/exclusion, verbal bullying, physical bullying, rumor spreading, and attacks on property than their non-SEN peers. The overall victimization rate for the SEN students in the current study is similar to the results of previous studies. In a review of related literature, Rose et al. (2011) reported that studies generally revealed the victimization rates to be in excess of 50% for children with disabilities.

In the second part of the present study, significant differences were found between SEN and non-SEN students in terms of the levels of overall and different types of victimization. These findings indicated that SEN students in inclusive classrooms were more victimized by verbal bullying, physical bullying, isolation, rumor spreading, and attacks on property as well as overall bullying than their typical peers. Several studies on peer victimization in children with disabilities also reported similar findings (Sabornie, 1994; Nabuzoka, 2003; Wiener & Mak, 2009; Bear et al., 2015). In the current study, it was found that SEN students have been most frequently exposed to social isolation/exclusion, followed by verbal bullying, rumor spreading, physical bullying, and attacks on property. More than half of the SEN students reported that they were not taken into the games (61.9%), they were not talked to them (59.9%), and they were not accepted to peer group (59.4%), moreover they were also subjected to verbal bullying in the form of teasing, annoying, swearing, name-calling or insulting (words such as stupid, silly or idiot, etc.). Previous studies also pointed out that students with special needs attending inclusive classrooms tend to be more exposed to social isolation/exclusion (Kavale & Forness, 1996; Llewellyn, 2000; Pavri, 2015), verbal and physical bullying (O'Moore & Hillary, 1989; Ziegler & Rosenstein-Manner, 1991; Llewellyn, 2000; Rose et al. 2011) than their typically developing peers. One of the reasons why students with special needs are more victimized than their typical peers may be related to their behavioral characteristics associated with the disability (Rose et al., 2011; Pavri, 2015). Children with disabilities have more peer-related social skills deficits and more problem behaviors than their typical peers (Kucuker & Cifci-Tekinarslan, 2015; Sucuoglu & Ozokcu, 2005); thus, they can have difficulties in developing and maintaining positive social relations (Sabornie & Beard, 1990), they receive less acceptance, more social exclusion/rejection, and are exposed to more peer bullying compared to typically developing peers (Kavale & Forness 1996; Gresham & MacMillan, 1997). Similar to the findings above, Reiter and Lapidot-Lefler (2007) reported that exposure to peer bullying among students with intellectual disabilities was correlated with emotional and interpersonal problems. Baumeister et al. (2008) also reported that thought problems, attention problems, disruptive behavior, and social problems in children with learning disabilities were positively correlated with peer victimization.

This study was also examined the relative contributions of the different types of peer victimization (*physical victimization, verbal victimization, isolation, rumor spreading, and attacks on property*) in predicting the self-esteem and loneliness in students with special needs (SEN). In the study, while all types of peer victimization under-investigation had a significant negative relationship with self-esteem of SEN students; being socially isolated /excluded (namely relational or indirect victimization) and physically bullied (namely overt or direct victimization) by their peers were found to be significant predictors of self-esteem. These findings suggest that negative experiences in peer relations (i.e. victimization experiences) may adversely affect students' opinions about themselves. Several other studies show that children/adolescents who are victimized by peer bullying tend to have lower self-esteem (Egan & Perry, 1998; Graham & Juvonen, 1998; Juvonen, Nishina, & Graham, 2000; Kapci, 2004; Piskin & Ayas, 2005). In the formation of self-concept, the role of social experiences is emphasized (Bandura, 1986; cited in Egan & Perry, 1998). While positive and supportive behaviors from important others, including peers, and self-observation of competent and effective functioning contribute to the formation of a healthy self-concept, the experience of being victimized may lead to a decrease in self-esteem over time by weakening the effects of these positive factors (Egan & Perry, 1998). Longitudinal studies suggest that children exposed to sustained peer bullying report themselves to have lower social competence and generally lower self-worth (Olweus, 1992).

Among the other main findings of this study, it was found that there were significant positive correlations between the different forms of peer victimization and loneliness, and it was also found that being socially isolated/excluded and being verbally victimized by peers were predictive of loneliness in students with special needs. Several studies in the literature showed that children who were victimized, experienced more loneliness (Boivin et al., 1995; Kochenderfer & Ladd, 1996; Graham & Juvonen, 1998; Hawker & Boulton, 2000; Juvonen et al., 2000; Pekel-Uludagli & Ucanok, 2005). In a longitudinal study, Kochenderfer-Ladd and Wardrop (2001) grouped children with respect to the timing and duration of peer victimization and examined the relationship between peer victimization and loneliness. It was found that when children moved to victim classification from non-victim group over time, their feelings of loneliness increased and their social satisfaction decreased. In the present study, being socially isolated/excluded by peers was found to be the most significant predictor of loneliness in the SEN students. It has been stated that being less accepted, more rejected, ignored or socially isolated by the peer group may lead to loneliness (Asher, Parkhurst, Hymel, & Williams, 1990; Pavri & Luftig, 2001; Bakkaloglu, 2010; Papoutsaki, Gena, & Kalyva, 2013). When compared to their typical peers, children with special needs are more exposed to social isolation / exclusion (Llewellyn, 2000; Gresham & McMillan, 1997), which may make them more vulnerable to experience loneliness (Bakkaloglu, 2010). Pavri (2015) indicated that although there has been considerable empirical evidence to support loneliness as a common result in children who are victimized from peer bullying; research findings had also indicated that children/adolescents who experience loneliness are more susceptible to persistent peer victimization than their typically developing peers.

Previous studies showed that having better social skills and forming positive relationships with others were related to receiving more peer acceptance, experiencing less social isolation/exclusion (Baydik & Bakkaloglu, 2009) and loneliness (Asher et al., 1990; Boivin, et al., 1995; Pavri & Luftig, 2001). In addition, children who have higher social competence may receive positive feedback for their social interactions from others and develop positive opinions about themselves (Sucuoglu & Cifci, 2001). It has been suggested that inclusive education can provide children with disabilities the opportunity to develop their social skills, to establish positive social relationships, and to be a part of the peer group (Odom, Buysse, & Soukakou, 2011). Several studies have shown that inclusive education leads to positive outcomes in terms of communication, social skills, and behavior for students with disabilities (see Katz & Mirenda, 2002, for a review). However, a number of studies have demonstrated that students with special needs attending in inclusive classrooms had poor social skills (Sucuoglu & Ozokcu, 2005; Kucuker & Cifci-Tekinarslan, 2015) which constitute a common risk factor for increased peer rejection and victimization (Kavale & Forness 1996; Gresham & MacMillan, 1997; Llewellyn, 2000). The findings of the present study also supported that the children with special needs in inclusive classrooms were more being victimized by various forms of peer bullying than their typical peers. Additionally, it was found that the perception of being isolated/excluded by peer group was predictive of lower self-esteem and greater feelings of loneliness in these students. These findings indicate the need for anti-bullying interventions to prevent or reduce peer bullying and victimization in schools. School administrators, especially teachers have the responsibility to take measures to prevent students from being subjected to peer bullying. The implementation of individualized positive behavioral supports such as social skills training into the regular curriculum may contribute increasing peer social acceptance and prevent or reduce peer victimization (Rose et al., 2011). Teachers in inclusive classrooms should follow proactive prevention strategies for at risk students, develop awareness towards social interactions among their students with and without special needs, and create a positive social climate which promotes acceptance of individual differences. As schoolwide prevention strategies considered, school administrators should create opportunities for teacher trainings, staff trainings, and teacher-parent collaborations to prevent or reduce peer victimization (Baker & Donnelly, 2001). Programs for prevention and intervention of peer bullying/victimization should include necessary modifications for students with special needs (Raskauskas, 2010).

Although the present study contributes to the existing literature on peer victimization in students with disabilities, some limitations should be kept in mind when interpreting the findings. In related literature, it is indicated that peer victimization's relationship with self-esteem and loneliness may be bidirectional and it may be an antecedent or a consequence of low self-esteem (Egan & Perry, 1998; Lohbeck & Petermann, 2016) and high level of loneliness (Pavri, 2015). The present study provides findings about the current correlates of peer victimization with self-esteem and loneliness in students with special needs. Cross-sectional studies, as in the present study, do not allow us to identify whether peer bullying is the cause or consequence of psychosocial adjustment problems (Wolke & Lereya, 2015). Therefore, it may be expected that carefully controlled prospective studies to provide more valuable information about the long-term effects of peer victimization on psychosocial functioning of children with special needs.

The majority of students with special needs who participated in this study had learning disabilities (56.3%), mild intellectual disabilities (39.6%), and a small group (4.1%) had autism spectrum disorders. This situation limits the generalizability of the findings. Thus, this study can be repeated on more representative samples in which students with other disabilities also participate. In addition, further studies may investigate the prevalence of peer victimization and its relationship with psychosocial adjustment in students with different disability groups. Finally, assessing peer victimization only by self-report method may be regarded as another limitation of the current study. Using multiple sources of information (e.g. self, peer, teacher, or observer) may provide a more comprehensive approach to understand peer victimization in students with disabilities.

Abstract

Corporate advertising, which is a type of communication activity that institutions carry out with the purpose of making themselves and their activities known and improving corporate image, is an advertising method that has long been used in the world but has started to be preferred in recent years in Turkey. The aim of this study is to reveal how corporate advertisements are perceived and whether corporate image is influenced by corporate advertisements or not, if it is, in what way it is influenced. In this context, first of all, the concept of corporate advertising was touched upon, its relation with the corporate image was tried to be revealed and a case analysis was conducted through Akbank's 70th anniversary advertisement. In order to measure the perception of the advertisement and its effect on corporate image, a pre-test application was carried out with 60 subjects via face-to-face questionnaires, then the corporate advertising film of Akbank was followed and post-test application was performed. The questionnaire consists of three parts: semi-structured questions, the 'Corporate Image Scale' adapted from the work of Kissel and Büttgen (2015) and demographic characteristics. The universe of the research consists of university students and the sample of the study is Selçuk University, Silifke-Taşucu Vocational School and Tourist Guidance Program students. At the end of the study, a positive interaction between corporate advertising and corporate image has been observed.

Keywords: Corporate Advertising, Corporate Image, Communication

Introduction

There is a rapid change in many areas of life, and it is impossible for companies not to be affected by the progress of technology and globalization. While giving great opportunities to institutions in the financial sector, developing technology also aggravates the competition among themselves from the other side. For a consumer, the probability that any product can be found in another competitor company is much more possible today than it was in the past, and the products have begun to resemble each other. Competition has moved beyond elements such as trust, speed and economy. Recently, economic crises in global and local scale have further refined the attitudes of consumers to banks. At this point, the corporate identities of the banks and the attitudes of consumers have become an important element of competition. In other words, how a bank is perceived in the context of customer preference has become even more important. For this reason, it is necessary for businesses to go beyond the structure of producing and marketing goods and services by approaching the target mass and establishing a rational and even emotional connection with them. One of the factors that determine how a bank is perceived is, of course, ads that are part of direct communication. Advertising, which enables companies to communicate directly with the consumer and has become a powerful marketing tool for the last century, is a powerful tool used to positively influence the customer's view. In the advertisements of the banks, they are aiming to draw attention, to show the advantageous and superior sides of the institution, to give confidence and to create a good image (Demir and et al, 2013). Becoming increasingly more important, corporate advertising is one of the most suitable tools for this. Every business benefits from corporate advertisements as a means of communication to communicate the elements of corporate identity to the target audience, to make it easier to keep in mind, to create a positive image for corporate and thus to make itself preferred on the market. Corporate's philosophy, corporate behavior and corporate culture information reach the target audience through corporate advertisements.

The aim of this study is to reveal how corporate advertisements are perceived and whether corporate image is influenced by corporate advertisements or not; if it is, in what way it is influenced. In this context, first of all, the concept of corporate advertising was touched upon, its relation with the corporate image was tried to be revealed and a case analysis was conducted through Akbank's 70th anniversary advertisement.

Corporate Advertising

Corporate advertising, which is confronted as "corporate advertising" or "institutional advertising" in different sources, can be defined;

-as the use of paid media, which is trying to benefit the image of the organization itself instead of its products and services(Okay,2016:344).

- also be described as a method of public relations that affects the reputation of institutions and distinguishes institutions from others in the target audience.

The purpose of corporate advertising is to contribute to the reputation and image of businesses rather than to advertise a specific product or service (Peltekoğlu, 2010: 18). Within advertising, Romaniuk and Nicholls (2006:179) emphasize that one of the key objectives of advertising is to influence the perceptions consumers hold about a brand in their memory .

In the study of Patti and McDonald (1985:45), which was conducted with mailing, 232 usable questionnaires, it was stated that 'image' and 'identity' advertising are the two most popular terms used to identify corporate advertising. This is due to the image-oriented nature of corporate advertising, which reflects corporate identity. The corporate identity and corporate image have always been important in the communication strategies of organizations.

On a general level, Webster's New Universal Unabridged Dictionary (1983, 907) defines image as: (a) A mental picture of something; conception; idea; impression,

(b) A concept of a person, product, institution etc. held by the general public, often one deliberately created or modified by publicity, advertising etc. (Webster's New Universal Unabridged Dictionary 1983, 907).

Institutional image is intellectual images in people's minds about various organizations. The organization's image was described as developing from an image construction process where audience members utilize any and all information they can access from advertising, the organization's buildings to passing conversations with acquaintances (Williams and Moffitt,1997).

Another important concept in the context of the image is the identity of the institution. The corporate identity defined as the path that a corporate chooses to express itself to the world has a wide list of elements ranging from institution's philosophy to visual elements such as logos and symbols (Brassington & Pettitt,2003:810). For banks, visual identity covers the areas of corporate print, including promotional material, the logo and typeface, corporate advertising and bank branch design. Corporate advertising is of great importance in terms of understanding the identity of the institution.

The concept of corporate identity has undergone a major change from the First World War to the present day. The first institutional advertisements are considered to have been made in the United States in the 1920s (Herbert, 1987, 2). Industrialization and the serious crises that have taken place have led to the need for public relations so that the institutions can get a good place in the eyes of the public, which led to the birth of corporate advertising. Corporate advertising has developed as one of the tools of creating image(Yücel, 2017: 46). Institutional advertising aiming to transfer corporate values is important for corporations as a form of convincing communication, and many companies resort to corporate advertising, although it doesn't cause a direct yield.

Bank provide array of services for the customers. It is hence necessary, to communicate information about these service, their benefit and new features a customer considering the financial aspect of the banking services, bank also have to build up an image of respect ability and viability through corporate advertising .

When confidence reposed in banks the customers would be better disposed to have dealings with them. Hence a bank has to constantly inform its customers. (Present and potential) about its services and about itself in order to build an image.

Akbank In Brief

Akbank was founded as a privately-owned commercial bank in Adana on January 30, 1948. Established originally with the core objective of providing funding to local cotton growers, the bank opened its first branch in the Sirkeci district of Istanbul on July 14, 1950. With a strong and extensive domestic distribution network of 800 branches and more than 14 thousand employees, Akbank operates from its Head Office in Istanbul and 22 regional directorates across Turkey. Akbank also serves more than 16.5 million customers through the Akbank Direkt Internet Branches, Akbank Direkt Mobile, the Call Center, 4,400 ATMs and more than 510 thousand POS terminals as well as other hightech channels. A digital banking pioneer in Turkey, Akbank gathered all its efforts in this flourishing area under the roof of Akbank Direkt. In a world with fast advances in technology and increasingly demanding customers, Akbank Direkt strives to satisfy client needs without time or physical location limitations while pioneering technological innovations in both the sector and in Turkey. Widely known for anticipating changes in trends and customer dynamics to develop new products and channels for meeting the individual financial needs of clients, Akbank has introduced many innovations to the Turkish banking industry. Committed to creating sustainable value for Turkey's economy, Akbank expanded its total loan portfolio to TL 209 billion (<https://www.akbank.com/en-us/investor-relations/Pages/Akbank-In-Brief.aspx>).

Methodology

In order to measure the perception of the advertisement and its effect on corporate image, a pre-test application was carried out with 60 subjects via face-to-face questionnaires, then the corporate advertising film of Akbank

was followed and post-test application was performed. The questionnaire consists of three parts: semi-structured questions adapted from Yücel's study (2017), the 'Corporate Image Scale' adapted from the work of Kissel and Büttgen (2015) and demographic characteristics. The universe of the research consists of university students and the sample of the study is Selçuk University, Silifke-Taşucu Vocational School ,Tourist Guiding Program students.

Corporate Advertisement Of Akbank

Findings

1.Demographic Information

Table 1: Demographic Information

age			gender			residence			
Frequency		Percent	Frequency		Percent	Frequency		Percent	
16-25	48	80,0	female	26	43,3	Valid	city center	21	35,0
26-35	12	20,0	male	34	56,7		subcity	32	53,3
Total	60	100,0	Total	60	100,0		village	7	11,7
							Total	60	100,0

It is seen that 80% of participant was between 16-25 years old and just 12 of hem were older than 25. Also, there seem a balance in terms of gender.

2.Account Information

We asked to participants if they had Akbank account or not, and they said ;

Table 2: Account Information

HavethebanksAccount

	Frequency	Percent	Valid Percent
YES	6	10,0	10,0
NO	54	90,0	90,0
Total	60	100,0	100,0

Then they were asked why they didn't have account the answerd were as following.

		why	
		Frequency	Percent
Valid	I DIDN'T NEED	14	23,3
	I DONT PREFER	37	61,7
	I HAVE ANOTHER BANK'S ACCOUNT	3	5,0
	TO SAVE MONEY	1	1,7
	PRESTIGE OF THE BANK	1	1,7
	Total	56	93,3
Missing	System	4	6,7
Total		60	100,0

3. Difference Between Pretest And Posttest

Pretest

Posttest

Table 3: Definition

define			Redefine		
	Frequency	Percent		Frequency	Percent
IT BRINGS IN	1	1,7	supportive	15	25,0
MONEY LENDER	3	5,0	Reliable	10	16,7
INNOVATIVE	4	6,7	art lover	5	8,3

RELIABLE	16	26,7	adequate	5	8,3
STABLE	8	13,3	innovative	5	8,3
POWERFUL	5	8,3	patriotic	10	16,7
ESTABLISHED BANK	5	8,3	Total	60	100,0
MONEY LOVER	7	11,7			
I DONT HAVE INFORMATION ON IT	7	11,7			
Total	60	100,0			

Participants were asked to define Akbank with a word before watching advertisement and most of them said it is reliable bank. After watching the ad, participants redefined the bank as stable, reliable and supportive.

4. Results About Advertisement

Did you like the ad?				most liked		
	Frequency	Percent	Valid Percent		Frequency	Percent
YES	60	100,0	100,0	scene	20	33,3
				message	5	8,3
				narration	10	16,7
				music	25	41,7
				Total	60	100,0

According to results all of the participants liked the ad and they said music is the most remarkable dimension of the ad.

When participants were asked what the most remarkable thing was in the ad, they said it touches upon the sensitivities of society. Another question was ; What impressions and emotions did this ad inspire in you? The answer which was given most was unity and solidarity.

the most remarkable thing			impression / emotion		
	Frequency	Percent		Frequency	Percent
touches upon the sensitivities of the country	15	25,0	stability	5	8,3
appeals to many segments of society	10	16,7	enthusiasm	10	16,7
Teacher and children painting school	15	25,0	sensitiveness	15	25,0
Flag	10	16,7	unity and solidarity	20	33,3
Its exiting in the every corner of the country	5	8,3	charitableness	5	8,3
the man walking on the snow	5	8,3	reliability	5	8,3
Total	60	100,0	Total	60	100,0

5. The Most Remarkable Scenes Of The Ad

6. Main Message Of The Advertisement

Main Message of the Ad

	Frequency	Percent
support for working people	5	8,3
Achievements from past to present	5	8,3
The aim of the bank is to support the country in every field	5	8,3
70th anniversary celebration	20	33,3
Introduce yourself	5	8,3
To say that it is a well-established bank	15	25,0
This bank serves beyond traditional banking	5	8,3
Total	60	100,0

20 people said '70th anniversary celebration' was main message, and yes, it is main purpose of the ad. So, we can say that we got very reflective and right results. Another remarkable item is 'To say that it is well-established bank' with 15 participants. Other statements shows equal distribution. It is clear that the ad is prospering as it transmitted messages successfully.

7. Distribution of Factors

Supports environmentally friendly projects.	60	205,00	3,4167	Supports environmentally friendly projects.	60	235,00	3,9167
Valid N (listwise)	60			Valid N (listwise)	60		

Average image value is 3,28.

Average image value is 4,19.

In last two tables ,we see variables affecting corporate image and mean scores for the factors that are formed by variables. Interpretation of the arithmetic meanings of the findings obtained in the study is based on the following intervals (Özdamar, 2003):

$1,00 \leq \text{arithmetic mean} \leq 2,60$: Low

$2,60 < \text{arithmetic mean} \leq 3,40$: Medium

$3,40 < \text{arithmetic mean} \leq 5,00$: High

According to average scores, it is clear that scores of all variables increased. Also, while corporate image perception was medium (3,28) before watching the advertisement, it rises up to 4,19 which is accepted as high value.

Conclusion

Briefly, banks ,like all other corporates, benefit from corporate advertising in order to develop positive corporate image. In the light of obtained data, it is clear that Akbank's 70th anniversary advertisement is very successful.

The messages intended to be delivered with the advertisement have been successfully transmitted to the target group and the desired perception has been provided to the target group.

Lastly and mainly, corporate advertising has a positive effect on corporate image when it is performed in a right way.

Perceptions Of Academic Staff And Teachers About The Utility And Contribution Of Educational Technology

Hüseyin Yaratın
Cyprus International University
hyaratan@ciu.edu.tr

Hüseyin GÖKSU
Cyprus International University
hgoksu@ciu.edu.tr

Abstract

This study investigated the current state of instructional technology utilization and contribution to education in higher education and K-12 schools in Cyprus and Turkey. The study intended to reveal perceptions of teachers and academic staff about technology utilization and contribution. The participants of the study constitutes 200 teachers and academic staff from different departments. A questionnaire was prepared and sent to the participants via the Internet and e-mail. The items of the questionnaire were answered by the respondents online from their mobile phones, tablets or computers. The results of the study will be analyzed to find out the differences in the perceptions of academic staff and teachers about the utility and contribution of classical and modern educational technology.

Performance Management In Higher Education: A Reflexive Approach To Heads Of Department's As Accountable For Academics' Performance

Sadi SEYAMA

Faculty of Health Sciences, University of Johannesburg South Africa
sseyama@uj.ac.za

Abstract

Performance management in higher education has been critiqued for enabling the encroachment of neoliberalism in public institutions, producing high performance expectations and surveillance practices that subjugate academics and managers. Caught up in the romanticism of leadership as a “solution to all ills” and hoping to mediate undesirable effects on performance management, I was moved to explore a different and appropriate academic HODs’ leadership for performance management. However, following a reflexive breakdown, seeing the blind spot in my study’s assumption that critical leadership is necessary to change academics’ performance conditions, I questioned the rationality of seeking it when HODs are barely doing the leading. This suggests the possibility of seeking alternative modes of organising (management, power, autonomy, peer influencing) that HODs are using or could undertake in universities within the confines of their contextually embedded roles.

Keywords: *Critical leadership, reflexive leadership, performance management, heads of department*

Introduction

Following the growing and rationalised encroachment of neoliberalism in higher education (HE), accountability mechanisms such as quality assurance and performance management (PM) are gaining ground. These mechanisms are necessary tools to foster a performative culture that responds to globalisation, national mandates, competition, diminishing resources and technological advances (Johnson, 2002). However, observations and literature point to PM as a problematic process that is rather a surveillance tool, policing academics as well as threatening education quality (Clarke & Knights, 2015). At the same time, the monetary rewards related to performance excellence are “not worth the sweat” (Seyama & Smith, 2015). In its attempt to enable alignment of institutional performance goals, PM effects a disciplinary power, subjugating HE managers and academics (Ball, 2015).

Scholars have raised strong objections against the seeming compliance and complicitness of academics in their own subjugation (Alvesson & Spicer, 2016; Ball, 2015; Clarke & Knights, 2015). Despite the risk of subjugated academics failing to fulfil their role of conscientising students and facilitating their growth as critical active citizens, there is evidence that academics do not resist repressive and subjugating PM practices.

As middle managers, academic heads of department (HODs, directors, chairpersons) are central to the implementation of PM in universities. Positioned as custodians of institutional vision and strategic goals, their role is to ensure that senior management’s (deans) performance targets filter down the hierarchy. However, as important as their HOD’s role is, it is difficult and ambiguous. They are confronted with divergent expectations from senior management and academics respectively (Cilliers & Pienaar, 2014). On the one-hand, senior management demands specific and higher performance targets and on the other hand, academics want HODs to create an amenable environment for them to achieve academic success and to protect them against unrealistic performance demands (Seyama & Smith, 2016).

In the light of HE’s increasing challenges and HODs’ changing roles, university senior managers and leadership scholars are explicit about the need for HODs to be leaders that transcend traditional managerial and administrative roles (Jones, 2011). Taylor and Machado (2006) observe that, “the complementary roles of leaders and managers with necessary planning expertise may provide the most productive higher education environment for advancement and progress” (p. 139).

Against this background, I was seduced by the idea of leadership as a “solution to all ills” (Meindl, 1995) and I embarked on a journey to explore a different and more appropriate leadership for PM, namely, critical leadership. I undertook a critical socio-constructionist case study with 25 HODs and academics to examine how SA universities’ academic HODs lead staff PM and why their leadership has come to take the form it has. In view of mainstream leadership studies’ neglect of leadership power dynamics in organisations (Collinson, 2011), critical leadership seemed a relevant approach to deconstruct power asymmetries dominating PM relations in universities. However, following a reflexive breakdown where I saw the blind spot in my study’s assumption that critical leadership is necessary to change academics’ repressive performance conditions, I had to regroup and dig deeper into my thinking about leadership.

With most HODs and academics reporting that HODs do not engage in leadership, I questioned the rationality of arguing for critical leadership when HODs are barely doing any leading.

Alvesson, Blom and Sveningsson's (2016) contend that amidst much talk and research about leadership, the act of leading tends to disappear in the organisational performance milieu. I argue in this paper that it is fallacious and limiting to focus only on leadership even if it is an important aspect of an organisation. This involved identifying alternative modes of organising that HODs use or can use within the confines of their contextually embedded roles. Hopefully, such modes can transform the current neoliberal performative context in universities and result in a non-subjecting PM.

I present critical meanings of leadership and the empirical evidence, both of which caution us against focusing only on HODs' leadership to address the problematic of PM in order to create less repressive working conditions for academics. Thus, in this paper, I analyse the dichotomous role of HODs and offer meanings of critical leadership and reflexive leadership approaches. I then present participants' views on HODs' leadership in the light of my re-interpretation of my data that offers a 'fresher' and more cautious perspective. Finally, I conclude with the meanings of leadership within academic institutions, followed by implications of my study for future research.

Context

I admit that I am guilty as charged for succumbing to the romanticism of leadership (Meindl, Ehrlich & Dukerich, 1985) when thinking of a possible solution to PM challenges in universities. Alvesson and Spicer (2014) clarify the reason for such a trap:

In many instances, embracing the idea of leadership does not involve any significant change to practice but merely indicates an interest in relabeling managerial work as "leadership" to make it sound more fashionable and impressive. The term *leadership* is seductive, has a strong rhetorical appeal, and is therefore heavily overused. (p. 40)

Learmonth and Morrell (2017) are also troubled by critical leadership scholars' display of leadership romanticism in their "*a priori*" use of the terms leadership or leader-follower dualism instead of management or manager-worker to refer to hierarchical distinctions in organisations. They argue that this threatens to weaken critical leadership studies' (CLS) position in confronting hegemonic power relations in organisations. Alvesson et al. (2016) also contend that the dominance of leadership discourse entangles researchers in a pigeon paradigm mode; consequently:

Nuances involved in the efforts to revise "leadership" are easily lost as the major framing reinforces an understanding that the alternatives to leadership is leadership, not peer relations, professionalism, autonomy, co-workership, organizing processes, or mutual adjustment offering alternative framings and understanding than what the leadership vocabulary invites. (p. 265)

As PM is a fairly 'new' practice in SA universities, the overwhelming empirical evidence that alludes to implementation complexities (Ngcamu, 2013; Seyama, 2013; Seyama & Smith, 2015) meant that I needed to be creative in the way I searched for a 'solution'. It was important that such a solution be sufficiently persuasive to get a buy-in from 'powerful' university stakeholders. Hence, perhaps, my ideological commitment to leadership. Following my earlier study, where academics argued strongly about HODs' lack of positional authority and competence to effect meaningful PM, I embarked on critical socio-constructivism study in search of critical leadership. I deduced that the first point of departure in conceptualising an emancipatory leadership of PM is an understanding of how power constitutes academic neoliberal subjectivities and its ramifications for academic activities. This would then provide the basis for academics and HODs to construct critical leadership perspectives of PM as an emancipatory project.

Early in my study, having interviewed almost half of the selected participants, I observed the seeming absence of critical leadership perspectives among HODs in their engagement with PM in their university. However, I understood this merely to be a limitation of critical leadership perspectives due to the academics being ready followers and willing to comply. And that HODs were still caught up in mainstream leadership thinking or post heroic leadership. These HODs did not provide the rich empirical material on possible critical leadership perspectives that I was probing and that some activist HODs were surely enacting. I even wrote a conference paper focusing on PM as a panoptic and governmentality practice, that subjugates academic and HODs' agency and that creates intellectually repressive conditions in educational spaces. In my discussion and conclusion I lamented HODs absent critical leadership perspectives. At one conference presentation, the renowned Professor Phillip Hallinger asked me if I knew why there

was no critical leadership. I did not know what to say. In fact, I was confused. I thought I had missed an important step in my study. However, he pointed out that it was because HODs, and academics in general, do not have the courage to do it or are afraid of reprisals for critiquing the system or going against the grain.

I continued with my study as planned. I recruited participant academics and HODs who are perceived to be activists, critical of neoliberal inflections in their university. Of course, they were in the minority. Since my assumptions for my study were founded on academics and HODs subjugation, I justified the absence of critical perspectives as an absence of critical leadership, which ideally should mediate against untenable performance conditions. The question then is, had I not initially searched for leadership, would I have understood my data differently and understood why both academics and HODs were evidently hesitant to refer to HODs' roles as those of leadership? Would I have recognised that I had boxed myself into 'leadership' spaces where the probability is very high that there are no answers or the answers are band-aid solutions?

Role Of Academic Heads Of Department

By its very nature, the department chairship is a series of interruptions and interactions with many people at multiple levels of the institution. (Wolverton, Ackerman & Holt, 2005, p. 229)

Wolverton et al. (2005) point out that an HODs' role is multifaceted, requires incumbents to interact with people at all levels in a university and is characterised by unclear and conflicting expectations of managerial vs. leadership roles (Cilliers & Pienaar, 2014). This plethora of roles means that the place of middle managers in HE is murky, resulting in it being difficult for HODs to fulfill the expectations of their role (Clegg & McAuley, 2005). While HODs as middle managers in universities are vital to the function of a university, their position is still vague (Nguyen, 2013). Essentially, academic middle managers are perceived to be intermediaries between senior managers and academics. They are expected to communicate university decisions to the personnel below them and at the same time ease tensions that could emanate from those decisions (Gleeson & Shain, 1999).

It is difficult to provide a comprehensive list of HODs' roles, duties and accountabilities (Nguyen, 2013), particularly with the growing calls for HODs to fulfil the leadership role necessitated by the current difficult context of HE. HODs are now required to employ managerial leadership, which is a "leadership exercised by people holding a managerial (appointed or elected, but formally superior) position, targeting formal subordinates" (Blom & Alvesson, 2014, p. 1). For instance, Rowley (1997) argues that HODs' leadership of academic work primarily involves managing the achievement of institutional strategic goals, thrusts and targets in the realm of teaching, research and community service, as these are regarded as the key pillars of HE. HODs have to "combine routine maintenance, long-term planning and performance review with encouragement for department growth, development and collaboration" (Middlehurst, 1993, p. 134). Consequently, their roles are diverse and determined mainly by their institutional contexts, especially how their universities respond to national and global forces as informed by the omnipresent neoliberal ideology (Johnson, 2002). To clarify the complex and dual nature of HODs' roles, Prichard (2000) distinguishes between two types of 'knowledge', namely, management and professional knowledge, which underpin HODs' roles:

Management knowledge - seeks to constitute the department as strategically focused, customer orientated, excellent in teaching and research and effectively managed. 'Professional Knowledge' – seeks to constitute departments as student-centred, teaching and/or research focused, collegially organised and possibly politically active. (p. 28-29)

This conceptualisation demonstrates the tenuous position of HODs in steering their departments. These knowledges can be seen as the essence of the role conflicts that HODs experience. An HOD's role is also determined by how individual HODs conceive of themselves in terms of their, "specific research groups, their sub-disciplines, or their area of professional expertise, which influences the roles they emphasise for themselves" (Bolden, Gosling, O'Brien, Peters, Ryan & Haslam, 2012, p. 5). Knight and Trowler (2001) posit that the following six aspects within a 'given framework' constructed by a university determine HODs' engagement with their positional roles:

Firstly, the nature of the activity as defined by the participants; secondly, the community of practice in which they operate; thirdly, the identity of the individual which is likely to be multiple, dynamic and situational contingent; fourthly, the meaning attributed to the role; fifthly, the discourse in which they operate; and finally, the technology available which will affect practice. (p. 49)

Nguyen (2013) observes that:

The Western-focused studies found six generic groups of duties of middle-level academic managers. These broad categories of tasks are department governance (mission, goals, policies, climate), programme management (tuition, research, service), human resource management, budget and resources, external communication and office management (supervision). (p. 2)

While the above responsibilities show that an HODs' role encompasses both management and leadership, the administrative role takes priority. HODs are accountable for operations, policy implementation and quality, and by default become burdened with administration (London, 2011). Research has shown that most HODs spend more than 50% of their time tackling ever-increasing administrative tasks (Nguyen, 2013); their leadership role is increasingly minimised (London, 2011; Murphy & Curtis, 2013). Having to juggle academic and management responsibilities makes an HOD's role particularly complex.

In this study, I recognise the duality of HODs' managerial and leadership roles but, most importantly, I acknowledge the inevitable call for HODs' leadership. However, leadership is a fundamentally contested notion (Grint, 2005). Varied opinions have been put forth about the meaning of leadership in HE, especially as HODs have not traditionally been regarded as leaders. As "reference to leadership inevitably raises the specter of the managerial role of HODs" (Jones, 2011, p. 280), academic dialogue and literature on HODs' leadership positions have become robust, provoking questions on what these leadership positions are or what they ought to be. Collinson's (2014) position on dialectical thinking could point us in the right direction when researching the role of HODs, as the above dichotomisation in roles overlooks the difficult leadership dynamics and their interconnectedness with management.

Critical Leadership: A Reflexive Approach

Critical leadership offers alternative leadership perspectives that aim to critically examine the normalised leadership power asymmetries in organisations. As a move from mainstream leadership studies (MLS), "critical leadership studies (CLS) explicitly recognize that, for good and/or ill, leaders and leadership dynamics (defined here as the shifting, asymmetrical interrelations between leaders, followers and contexts) also exercise significant power and influence over contemporary organizational and societal processes" (Collinson, 2011, p. 181). Critical leadership disentangles leadership's understanding or meaning from concise, constant and objective definitions or descriptions to a more adaptable social organisational practice that is given meaning by those experiencing it, within a particular setting and under specific circumstances. Critical leadership focuses on non leader-centric notions of leadership, acknowledging follower agency and its influence on enabling or disabling leadership (Collinson, 2011). CLS critiques the romanticism of leadership, which gives it cult-like status as the only mode of organising that can solve all organisational problems (Meindl et al., 1985). It cautions one against the liberal and popular use of leadership at the expense of management (Collinson, 2014). According to Alvesson et al. (2016):

Sometimes leadership may be central, but so might management, the use of power and less hierarchical modes of organizing, including people being supported by teams, autonomy and professional networks rather than a leader. All this may be indirectly influenced by leadership that is, for example, focused on developing teams or encouraging people to use a broad set of contacts, but various modes of organizing often grow organically and are influenced by cultures, groups and individuals other than leaders. (p. 4)

A reflexive leadership approach within CLS reveals the shortcomings of leader-centric notions of leadership. In addition, reflexivity furthers these studies' objective by seeking to offer extant alternative organisational practices that also contribute to organisational performance. Alvesson and Kärreman (2016) suggest these as "peer relations, professionalism, autonomy, co-workership, organizing processes, or mutual adjustment" (p. 142). Guiding my re-thinking in seeking a solution for problematic and unfeasible PM practices in leadership is Alvesson and Kärreman's (2013) conception of reflexivity as "being about challenging different perspectives and vocabularies and avoiding being caught in a specific view or way of understanding phenomena, but seeing shortcomings and being open for alternatives" (p. 35). I am moving away from the tendency to accept unquestioningly theoretical assumptions founded on specific empirical contexts. In order to present my argument for a reflexive approach to leadership to interrogate PM in HE, I subscribe to Meindl et al.'s (1985) notion that "leadership is in the eye of the beholder" (p. 79). I critically examine leadership meanings, within their context of those being led. I therefore interrogate how academics as positional subordinates with the possibility of 'receiving' HODs' leadership construct and examine such leadership. From this perspective, we might gain an insight on their 'demand' for leadership (Blom & Alvesson, 2014). Opening

up HODs' leadership as a demanded leadership, positions academics as fundamental to granting or legitimising HODs' leadership, if they receive it (DeRue & Ashford, 2010). At the same time, academics can deligitimise HODs' leadership if they reject it (DeRue & Ashford, 2010). In this sense, leaders and followers engage in a leadership relationship out of their own volition as opposed to a managerial relationship where positional authority compels subordinates' compliance (Blom & Alvesson, 2018).

I am re-looking at my empirical material, which reveals academics and HODs' hesitation to refer to HODs' leadership, or their lack of capacity to lead because of the university's constraining environment. Yet, SU is reported to be one of the top performing universities' in SA. Academics are still performing despite the absence of HODs' influence, direction or guidance, which are typical of leadership. Arguably, in this setting, HODs leadership could be inconsequential. Therefore, I am re-reading my data to remove my blinkers and to see that leadership is not central to performance. Rather, I am searching for what *is* stimulating academics' performance.

In my study, I assumed that leadership is present in academic-HODs' dynamic even if it is minimal. The focus of my study's data interpretation was on how academics perceive HODs', as their line managers, leadership. Reflecting on this assumption in the light of my data, that is, absent HOD leadership, was fundamental to my assumption's breaking down. By adopting a reflexive approach, I have shifted from the conventional understanding of leadership that largely perceives it to be an all-encompassing organisational practice that is pivotal to all aspects of organisational functioning and success (Alvesson et al., 2016). This understanding that leadership always serves the best interests of the organisation, attributes such a powerful position to leadership that all other organisational practices are relegated to the background, if acknowledged at all (Alvesson et al., 2016). As a consequence:

...managers think that they need to exercise leadership and that a solution to many/most organizational problems is more/better/ different leadership. For formal subordinates, the reinforcement of leadership ideology may result in a lack of autonomy and initiative since leadership is supposed to be the source of visions, values, inspiration and meaning at work. (Blom & Alvesson, 2015, p. 486)

With leadership as the primary focus of analysis, opportunities to deepen our understanding of how organisations and people work outside of leadership, are lost. As noted above, this thinking creates conditions that enables leaders to uphold unequal power relations, thereby subjugating followers. As Wilson (2014) points out, "leadership has been repeatedly constructed as the necessary and appropriate response to the 'problem' of the follower, thereby contributing to the continuing prevalence of a leader-centric understanding of leadership" (p. 1). I take the position that leadership is more than a social construction or communicative process. I acknowledge the importance of authorising or granting the leader-follower dynamic in leadership, as espoused by Alvesson and Blom (2015) who state that "leadership is not follower-free, and followership seldom means blind obedience" (p. 272). Accordingly, leadership is also contingent upon followers' demand for it.

I am re-interpreting my data as I explore academics' views of HODs' role from a leadership perspective, that is, "understanding how managers become leaders in the eyes of their followers" (Chiu, Balkundi & Weinberg, 2017, p. 335). In keeping with social constructionists' position, leadership is not only the domain of positional managers, but also that of subordinates. Therefore, leadership is flexible. It emerges within the continuum of leader and followers, where there is "mutual influencing or switched roles over time" (Blom & Alvesson, 2015, p. 487). Also, depending on the situation, leaders lead from behind and followers follow from the front (Moore, 2012).

As leadership is relational (DeRue & Ashford, 2010), it is important to consider that "the nature of leader-follower relationships (either positive or negative) could affect how followers judge their manager thus influence their leadership perceptions" (Chiu et al., 2017, p. 335). A leadership relationship between managers and subordinates is perceived to benefit both parties in that "managers are more likely to have positive evaluations, build constructive relationships with followers, and access more resources, all of which benefit manager performance" (Lord & Maher, 1990 cited in Chiu et al., 2017, p. 336). Described as an influencing organisational mode or practice, leadership is therefore not dependent on the power of formal authority as is the case in the relationship between managers and subordinates (Blom & Alvesson, 2014).

In making leadership the focus of my study, I believe that I ended up being blind to, ignoring or disregarding other aspects of organisational work life that are already bubbling beneath the surface and that could inform one about what

makes the university successful in the dichotomous, autonomous-collegial and managerial-autocratic terrains. As Blom and Alvesson (2015) suggest:

Also ‘horizontal’ modes of organizing – peer influencing, teamwork and autonomy – may to some extent be an outcome of or dependent on leadership support (and thereby less horizontal). But even if leadership sometimes can be important for, and overlap, other modes of organizing, this does not motivate that leadership as a term is invoked so broadly so that it covers more or less all forms of organizing. (p. 488)

Methodology

I conducted the research using a qualitative case study method premised on a critical socio-constructionist paradigm (Hosking, 2008). The study focused on understanding participants’ attribution of meaning to the leadership of PM and, importantly, how their contexts influenced its implementation and impact on stakeholders. Data were collected from personal interviews with HODs and academics. The centrality of power dynamics in the process was interrogated. Participants responded to questions about their experience of PM at SU. Twenty-five 45-60 minutes interviews were conducted. With the participants’ approval, each interview was audio-recorded. All the interviews were transcribed verbatim. To ensure anonymity of participants, pseudonyms were used to represent participants’ voices.

My analysis of data followed an “exploratory analysis [which] is the classic content-driven, inductive approach that most people associate with qualitative research” (Guest, MacQueen & Namey, 2012, p. 49). Following an iterative process, I first coded and categorised my data. This included recognising, analysing and reporting patterns within the data (Saldaña, 2009). The content was then critically interpreted and reflected upon in relation to ideology, power and social reproduction using critical performativity tactics of affirmative care, progressive pragmatism and presenting potentialities (Alvesson & Spicer, 2012). This resulted in critical accounts of the HODs’ role in academics’ PM that uncovered the research participants’ attribution of meaning to leadership.

Findings

Heads Of Departments’ Leadership In The Eyes Of The Beholders (Academics)

While the aim of this study was to offer a critical reading of PM practices at a university in order to reveal extant critical leadership perspectives, dialogue with participants exposed a reluctant leader-follower dynamic between HODs and academics. Academics do not fit into the conventional conception of followers as willing and ready to be led. Empirical studies also suggest that leadership does not always exist within HOD-academics relations. Positioning academics’ perspectives outside leader-centric notions of leadership, the findings offer a critical reading of HODs’ managerial leadership at SU that suggests a fragile existence of leader-follower relations. Alternatively, if one takes Learmonth and Morrell’s (2017) caution against overuse of the term leadership, the HOD-academic relations are more manager-worker relations, which infers non-influential relations. Participants expressed a persistent view that points to a neoliberal managerialist approach in HE that result in HODs operating under some executive deans’ autocratic and instructive leadership. This compromises HODs’ influence and power standing perceptions among their subordinates. For this reason, academics are disinclined to accept HODs’ leadership. For Shane (academic):

You see, as I have indicated, I’m just getting a sense that HODs are not professionally empowered in terms of performance management. Because I was under the impression that...once you’ve agreed with your line manager, the dean has to just approve and send everything to the HR...But now it looks like the dean has no full confidence on HODs as line managers.

Jay (academic) also offered his observation of his HOD as someone under the dean’s power:

...most times she takes instructions from the dean that should have been interrogated first by HODs at their level as executive...before they come to us. But you can’t bring the idea to me...and I know it’s personal...and you tell me, no, because the dean has said it. Did you ask? No, the dean insisted we should do it.

Sandy (academic) alluded to the deans yielding power in more nuanced and probably unintended ways. However, it has the same silencing impact. She described her dean’s influence among the faculty’s HODs:

He being a... strong character, because I think that my line manager is a very strong person. You...learn also that there are bad things about being strong. Because that tends to...lend itself to...the perception that you might be domineering. So you tend to have an effect where people would actually suppress what they feel

because they are scared. Or, not scared. I think scared is...a bad word. I think sort of intimidated or sort of unsure because of how well versed or how well knowledgeable you are as a leader. So, I think for me that...is the one aspect of leadership that I will look at that maybe...that's not such a good thing...

Sandy's observation reflects Learmonth and Morrell's (2017) view that leadership can become a manipulative and controlling tool:

This is because the cultural valences associated with the language of leadership imply neither struggle between leader and follower nor anything else that might be particularly oppressive or oppositional. Rather, they suggest that the norm is friendly relations, and that a person's (i.e. a so-called follower's) primary allegiance is (or should be) to her leader – not solidarity with other workers. (p. 266)

Both participants place HODs in follower positions but agentially subordinated to their deans. This situation places HODs on a shaky ground for exercising leadership. In this respect, academics are evidently not inclined to grant HODs a leader identity or leadership role. HODs also alluded to the unhealthy hierarchy that stifles them from exercising leadership in managing staff's performance:

So, if you're working in an environment where you have very autocratic top management, you don't allow any room for thought or anything. We just do what you say. You'll then have people below that tend to treat the staff the same way, because they know it's futile to try something new or something different. (Carter, HOD)

PM consistency meetings, where final performance appraisal ratings are determined, appear to place a severe constraint on HODs' possibilities for leadership. At SU, the rating scale ranges between five and one, with five indicating exceptional performance and four excellent performance. These signal that employees' performance has attained more than the contracted performance targets. A rating of three indicates adequate performance, which signals achievement of the contracted targets. Ratings of two and one signal poor performance and non-performance respectively. Charles (HOD) and Noel (HOD) related their experiences of appraising their colleagues' performance at the end of the year. Their ratings were overruled at their faculties' consistency meetings directed by the deans. Noel (HOD) tried to approach the ratings realistically by taking into consideration the academics' context and the authenticity of their performance as opposed to seeking the 'high performer' who can play the game:

Here is a person who can't play the game but still managed to publish one article. So, when I rate them...I actually try to rate them higher. The issue now becomes...but then how am I going to justify that to the dean? The problem is always trying to justify. So I've consistently rated my staff higher than the dean approves. So, last year for instance, the dean did reduce the ratings for many in the department and generally across the faculty.

Charles found himself in a difficult position when he had to explain to a staff member the consistency meeting's decision to reverse a rating of four:

I mean, the worst for me...I gave a person a [rating of] four and it went to a [consistency] meeting and they felt that it wasn't a four. And that responsibility became mine to communicate back to the staff member. And I have a problem with that because that's not me that decided that. The dean should actually bring those staff members in and say, "unfortunately the committee felt that...wasn't a four. Your HOD defended it and unfortunately the committee overruled it". Because now it comes back to I've said yes...and that's not good for relationships. (Charles, HOD)

Rosemary (HOD) was similarly conflicted in having to relay the dean's message of a lowered rating:

Also feeling too bad to tell them that you haven't got quite there yet. Because I know they've worked really hard to get there. So then, it's easy to shift the blame then saying, "well, it was not awarded". Rather than saying, "you need to push so much more harder" because I really know they're working to their max [maximum].

Cameron (academic) made an insightful comment:

Now, I look at my remuneration for my performance appraisal...for now the HOD doesn't have a foot to stand on because the dean has overruled him. So the HOD comes back to me and says the dean said, "I have to give you a [rating of] two". What is that saying to my confidence in my line manager/HOD? So it's going to affect my performance next. So, that means I'm going to say to you, "I'll just do the bare minimum because I got a two". I'll just do a two because even if I do a five, if I do so much, the dean still got the ultimate decision-making power, which doesn't work with me. He doesn't see me perform. He was getting the processes and seeing a, b, c, d, but now the dean is subjective because you might have a run in with the dean.

In the examples reported above, HODs' PM decisions were overruled. This demonstrates how the PM process at SU negatively affects academics' confidence in their HODs. These examples show how HODs find themselves in an ambivalent position. On the one hand, they are obliged to follow their deans' instructions while on the other hand, HODs are aware that this undermines their colleagues' confidence in them. Managerialism holds sway in these circumstances. Any power that HODs may have is nullified. HODs are caught in a difficult situation. Their superiors in the hierarchy expect them to safeguard the university's interests, whilst at the same time their departmental academic staff expect their HODs to be their representatives and to shield them from executive power (Cilliers & Pienaar, 2014; Johnson, 2002). Academics' perceptions of the power that HODs can or cannot wield shapes or constructs their acceptance or rejection of HODs' leadership. In this study, participants perceive HODs to have limited power and therefore question their leadership. The research participants' experience suggests that HODs' positional authority is merely rhetorical (Middlehurst, 1993) and rests on a shaky ground. Although it is assumed that managers have more power than subordinates (Blom & Alvesson, 2018), which provides a premise from which managers can lead, in my study it appears that academics do not regard their HODs as being more influential than them. This closes the door on HODs' leadership.

Participants made little reference to leadership in their accounts of their experience of PM, except when I prodded. Even then, there was a hesitation in providing 'leadership' accounts. I ought to have understood this as an indication of HODs' negligible leadership practice. Alvesson and Sveningsson (2003) refer to the disappearance of leadership, although in my study, perhaps, it is a case of leadership in absentia. Academics recognise HODs as managers of their departments but that leadership is not an inherent outcome of their HOD's role. With increasing managerialism and complex challenges in HE, it is incumbent on HODs to exercise leadership (Bolden et al., 2012). Academics expect HODs to demonstrate leadership. However, that leadership seems to be largely contingent upon how HODs deal with PM. Academics' concerns point to a need for HODs' to exercise leadership by proactively intervening in or confronting PM issues, in relation to decisions about performance rewards in particular. This relates to Blom and Alvesson's (2013) notion of leadership on demand, where:

Demand indicates an interest in 'receiving' managerial leadership, i.e. taking a clear (but possibly temporal, conditional or situation-specific) followership position in relation to a formerly superior manager and viewing him/her as a leader, i.e. a significant source of meaning-making, support, and/or direction. (p. 1)

Typical of knowledge intensive organisations, where subordinates' work is driven autonomously (Alvesson & Sveningsson, 2003), academics in this study have preferences as to when and under what circumstances HODs should lead. So "the need and space for leadership is limited" (Alvesson & Sveningsson, 2003, p. 376). Leadership in this context is an unstable notion. It prompts questions such as, "who is regarded as being a leader, where leadership is seen to be done or needed, how leadership is thought to be done, and what exactly leadership is thought to be" (Alvesson & Spicer, 2012, p. 374).

Academics' perceptions that HODs' hierarchical authority is undermined by their deans' power reflects that HODs have been stripped of their formal leadership influence. Consequently, these academics do not recognise their HODs as leaders. In SU's constraining PM context, reported on by both academics and HODs, one would assume that power would be the focal point of contestation and that there would be an exploration of alternative modes of exercising power. Research could examine modes that enable the practice of freedom. For instance, formal hierarchical authority is not the only means through which HODs can enable their departments to function. They could explore their social or informal networks that give them social power (Chiu et al., 2017). It is patent here that "managers' influence and power helps followers see them as leaders or not" (Chiu et al., 2017, p. 335).

As Wilson (2014) suggests, "the positioning of followers is contingent on the assumptions made about both leaders

and followers” (p. 27). In positioning academics from a non-leader-centric perspective, “... we rethink followers as knowledgeable agents, we can begin to see them as proactive, self-aware and knowing subjects who have at their disposal a repertoire of possible agencies within the workplace” (Collinson, 2011, p. 185). The data reported above provide evidence of SU academics’ non-leadership assumptions about HODs. The academics are not willing followers and they have not relinquished their agency. Their positioning is not passive. They do not regard their HODs to be worthy of their followership. There is negligible evidence to support a vertical or top-down reading of HODs’ influence on academics. It is arguable then that there is no HOD leadership, let alone critical leadership. In the same vein, HODs also are not ready and willing leaders.

This finding aligns with the de-romantisation of leadership that de-emphasises leader-centric organisational relationships. These academics as followers prompt organisational modes beyond the traditional confines of leadership. While there is a distinction between positional authority and leadership, in this study the academics view authority as important to HODs’ leadership. It suggests that power is situated in positional authority. Collinson (2014) posits, “it is leaders who typically exercise considerable control over: scarce resources; decision making; structures, rules and regulations; formal communications; strategies and visions; corporate cultures; performance management; rewards and sanctions; and hiring and firing” (p. 37).

Conclusion

My aim in this paper was to problematise the conventional understanding of leadership as a necessary and all-encompassing organisation mode that is inherently good or worthy and superior to all other organising practices. Fundamental to this paper is my question: “Why did I look to leadership as a solution for PM problems at a university?” People in organisations and leadership scholars alike treat leadership as a priceless currency that is immune from economic fluctuations. To disturb its stability or enduring value is like disturbing a snake in its hole, that one will regret. Why would one risk causing such a disturbance? The discourse of leadership has had an overbearing and enduring influence on human relations in organisations and in society. Leadership is regarded as the premise upon which all organisational purposes, functions and activities are defined and given meaning. Over time, leadership has become deeply interwoven in all aspects of organisational thinking and practice. Unfortunately, this state of affairs has largely trapped us in a web of fallacies about the unquestionable need or value of leadership in organisations. We then fail to take into account the possibility of other ways or modes that effect organisational success or that prevent leadership failure.

An interrogation of academic HODs’ role in PM is not simply about leadership. As I argued earlier, HODs’ role in PM is a complex phenomenon and, depending on the context and identities of the parties in the PM process, other organising modes should be examined in understanding PM dynamics and, importantly, in making it a non-subjugating and amenable process. For the academics in the study, HOD leadership is not on demand. The data point to subjugated HODs with little or no influence over the academics in their departments. This points to the non-centrality of leadership in academics’ daily performance. Autonomy appears to be the precipitator of PM as a tool to achieve performance ‘outcomes’. In the context of my study, such a leadership demand is determined by or dependent on how HODs engage with PM from a non-subjugating or neoliberally dubious perspective. HODs’ leadership is good only insofar as they are conscious of academics’ limited need for leadership. This is due to academics’ performance being supported by their own autonomy and peer networking.

Further emphasised in the study is the distinction between management and leadership in HODs’ complex positions in universities. These are not always mutually exclusive, as is often inferred in how we talk about them. In these organisational spaces, the power dynamics among leaders and followers is unbounded, interchangeable and complex. The discussion also illuminates the need to interrogate HODs’ informal networks as possible sources of social power, since their hierarchical authority is diminished or annihilated even by the deans’ power.

The reflexive leadership approach adopted in this study highlights the limited role of leadership in the HOD-academic dynamic. It confirms academics as knowledgeable professionals, reliant on their own expertise or peers instead of leadership, which is often perceived to be a hindrance. Importantly, the reflexive approach provides opportunities to critically review multiple and diverse organising modes in the contemporary university. It offers an understanding of existing organising modes’ dichotomies and highlights their value in organisational life. However, a reflexive approach does not argue against the importance of leadership in university departments, save for taking heed that an exaggerated dependence on leadership can blind one to alternative work-organising practices. Leadership should not be a mode that is thrown at every work situation, as there is a place and time for leadership in knowledge intensive organisations such

as universities. Of particular importance is the positioning of HODs in the eyes of academics, where HODs' leadership becomes contingent on a situation.

In a context where leadership reflects followers' needs for independence, such leadership is the overarching mode under which other modes are enabled. It diverts us away from predominantly hierarchical descriptions of relations in organisations. It clarifies the distinction between vertical and horizontal hierarchy. In adopting a reflexive approach, I have examined a romanticised view of leadership, which constrains a critical understanding of how followers influence leadership. In the HOD-academic dynamic, I suggest that followership is an important variable in understanding leadership in academic spaces. The lesson in this study is that one has to avoid overplaying a leadership discourse, which reifies its excessive power; thereby giving it more latitude than it is due.

Philosophy As A Basis Of Education And Formation. An Essay On Behalf Human Happiness

Carlos De Sousa REIS
Coimbra University
csreis@uc.pt

Abstract

We start by a genealogical exploration of the philosophical attitude as the basis of "Paideia", trying to show how the philosopher enthusiastically launches himself in search of wisdom, while at the same time giving himself up to the care of his soul addressed to attaining an ontological harmony. Such dynamic implies an act of conversion or metamorphosis that endows human existence with a radicalization of the gaze capable of opening the door of conceptual creation, simultaneously, parrhesiastic and critical, which affirms philosophy as the basis of education and training. But these are understood as teleologically committed to forming the person, which is a task that goes beyond the current drift of the mainstreaming utilitarian reason.

Portrayal Of Perception Of Women In Domestic Series And Its Comparison With The Real-Life Woman's Figure, From Woman's Perspective

Abstract

Aim and Importance of the Study: TV series play a key role in shaping the society. In this study, the aim is to identify the authenticity of the woman's roles portrayed in the series with the real life and make comparison of with the real-life woman's figure as well as to review the image of woman from woman's perspective, which is represented to the public and determine to what extent this image can be perceived as role model. This study intends to raise awareness in resetting and redesigning women's roles in TV series.

The Research Method: In this study, out of Qualitative Research Methods, the method of interviewing was applied. Stewart and Cash (1985) described interviewing as "*a process of dyadic, relational communication with a predetermined and serious purpose designed to interchange behavior and involving the asking and answering of questions*". From woman's perspective, 10 women professionals got involved in the research conducted on the portrayal of perception of women and its comparison with the real-life woman's figure and their responses were analyzed using the qualitative research methods. The relevant resources in literature were also reviewed and the woman's figure in TV series was examined.

The Study's Aim and Research Questions: In today's broadcasting, TV series have great importance. This study aims to assess the perception of woman in TV series followed by a great majority of public from woman's perspective and examine the presented perception through comparison with the real-life woman's figure, and these research questions were asked such below:

- 1) How do you think are women portrayed in domestic TV series?
- 2) What extent is that model of woman authentic with the real life?
- 3) What would you say when asked to characterize the women that you have viewed in the series?
- 4) Do the economic statuses of the women portrayed in TV series correspond to those in the real life?
- 5) How should the woman's figure be in those series when considering its potential implications in the society?

Findings and Conclusion: As a result of this study, it was observed that there are limited similarities between the serial female characters and the real life figures. It is observed that they are portrayed as powerless, weak, whiny and under male dominance, or class- and power-focused, wealthy, ambitious, dominant and intriguing and with beautiful physicalities.

Keywords: *Perception of women, domestic series, television*

Introduction

Women have a very powerful, important and determinant role in society. To identify social attitudes and behaviors, education given within the family or in the education system undoubtedly has great importance. Education might be very determinant of the social structural analysis, particularly family education. Another concept of these determinants is media, one of the key figures in social engineering.

In any individual's whole life or only specific part of it, women have always played a vital role. They shaped a big part of the physical, psychological and educational development of each of us, regardless of gender. The women, as mother, sister, and/or partner, are moulders of the set of human behaviors that these social determinants are often learnt unconsciously and transformed into characteristic structures.

The female role is very critical that they are one of the key determinants in family or society because every individual is grown up with a female model. However, we need to mention another dynamics that are moulded by women within the community. Undoubtedly that is media which is one of the main factors shaping the society whether deliberately or unintentionally.

Since 1950's, media has emerged as the principal actor in the formation of social dynamics including the investigation of the ideological structure and behavioral pattern of the public and the role model structures of the individuals. Out of various media instruments, television is major one with its influencing power. In this sense, the fact that TV programs are shaping our society has for long been taken as given.

In TV broadcasting, the series and the behaviors referred to the female characters in these, and the extent to which their characteristics correspond to the real life woman's image can be designed as a research topic. It has been mostly recognized that TV has the dominant role in the opinion leadership for society or the thought determinant, however one of the key contributing factors is rating and audience measurements.

TV series are one of the elements capturing the highest ratings in broadcasting, which provide key economic inputs. It may not be admittedly very realistic in terms of both ratings and attention that the female characters in the series are supposed to jibe with the women's image in reality.

Notwithstanding all this, this study aims to recognize how a female character portrayed in TV series is viewed from the women's perspective in the real life and try to see what the perception of women is and should be in these series which are moulding and caring for the society in female's eyes.

"We should take into consideration that media not only shapes the views and attitudes of men and boys towards women and girls to some extent but also consolidates the women's negative thoughts about themselves." (Özerkan, 2004; 21)

In Turkey, women's social contributions were considered when the role of their determinant and moulding elements was recognized, and some media roles were attributed in this way. The women's role have been re-established, which was seen as bringing up kids to be good family members and being an effective instiller of moral and humanistic values with abstract social rules. In social understanding, woman's figure very often takes place as guiding the family unity, catalyzing intrafamily mechanism, and acting as a natural unifier. Female in TV series is a visual icon of the society and however rather associated with the virtue-oriented behaviors moulding the family and being out of the basic needs of the public such as moral and humanistic values and abstract social rules. The media reflection and the public acceptance of such perception also could possibly be come across in these days (e.g. Ekmek Teknesi (*Bread and Butter*), Perihan Abila (*Sister Perihan*), Bizim Mahalle (*Our Neighbourhood*)).

"In Turkey, the programs for women was first originated with "Ev Saati" (Home Time) on radio in 1939, which would continue under the name of "Ev İçi" (Intra-House) on the matters including child care, health, and family, in general. In broadcasting objectives for such programmes, women are described as one of the basic elements to realize the happy aspects of society. Although women are specified as good partners and mothers in family as well as humanbeing in the world and citizen in the society, they cannot get out of the identity of housewives restricted within the walls of home (Akbulut, 2004:159).

Society is like a living organism which is living, transforming, developing, and improving itself. The behavioral ways of individuals in the community and their responses to phenomena and statuses can be regarded as the mechanism that is keeping the society alive and developing and changing it. The role of media has a very substantial role in shaping the public opinion. TV channels, radio broadcasts, newspapers, magazines, periodicals, and all publications are the most important part of this formation and perception, as well as digital media and social networks that are increasingly getting more important.

In this sense, TV broadcasts, the principal actor of media, have undertaken a serious role in the perception of women since they were launched in public. It can be acclaimed that TV's impact might have continued almost unabated from then on. Shaping and shifting the society, TV programmes gave a role to women especially in the earliest years. This consists of a whole of references characterizing women and crystallizing how the community should read the perception of women. The perception of women who are fond, lenient, altruistic, devoted, value family unity above all, bring up good boys and at the very core of their characteristics, include the notions of chastity and selflessness, was manifesting itself in almost all programmes (e.g. Kaynanalar (Mothers in law), Bizimkiler (Our Family), Yedi Numara (Number Seven)).

"Once TV broadcasting commenced following radio, many programs have been made for women. In these, traditional roles of women, such as a self-sacrificing mother, a good wife, and a housewife, were highlighted. Most effective and common instrument of culturization in modern societies, television is major one of the mass media putting their stamp on our age. Women represented in series, films, ads, music clips, magazine programmes are mostly portrayed with their sexuality and become exploited by media. Females in TV shows have to be well-groomed and good-looking, that's the most important one of the required qualifications is that they have beautiful physical appearance. It would not be exaggerated to say that females are currently transformed to visual objects on TV." (Büyükbaykal, 2011)

The perception of women portrayed in domestic series from mid 1990's till the earliest 2000's gave way to a modern, ambitious and aggressive model of women with a substantial change experienced in the early 2000's. Female characters in the series of 1990 had the stories in which she was just stuck in the middle of a large family and sometimes the oppression of tribal culture and also had went through the trials and tribulations while she had difficulty in adaptation phase to those traditions and seldomly made uprising (e.g. Asmalı Konak (Vine Villa), Zerde (a female name), Beyaz Gelincik (White Weasel), Sila (a female name)).

Many stereotyped codes used for male and female characters in Yeşilçam (Turkish) melodramas now reappear in disguise with the modified screens of our domestic series (sometimes undisguised, exactly the same). The traditional patriarchal discourse is getting more powerful in time." (Özsoy, 2018)

Of the female image in these series, passivity as a common approach almost never changed. Women was not rulers but obedient, or not playmakers but always defenders or guards against intrigues. The study of TÜSIAD (*an NGO in Turkey*) on the perception of women over 12 series noted the standardized female model.

In a relevant news, Özlem Gürses from Sözcü Newspaper reported: “TÜSIAD releases the study findings of ‘Perception of Women in TV series’. This suggests that ‘women are portrayed in 12 series most popular in Turkey much apart from reality and unfortunately in one single stereotype: like the creatures which are never businesslike, always whinny, flabby, and mopy.’ In this study conducted by TÜSIAD in partnership with a university, 12 out of the most popular series in Turkey was sampled and each one of them was analyzed frame by frame during the month of May. That news is going on like: *“The results are sobering! We often use a language to feed these stereotypes and prejudices even regardlessly. Whereas the intelligents engaged particularly in the ad and series sectors are highly creative and exceptional, and even they have freshly recognized by means of our these studies. The same problem is also valid for males; as much as one man is persistently portrayed in series as aggressive, red-hot, violent, this bad image sticks on men. Above all, females are jammed with physical shapes, and while males are represented at every point of the spectrum, they are all imaged as under 39, skinny or fleshy and matronly. Here is the thing that is “rendering the diversity” in every respect. Women are romantic, it’s alright, but how about men? Or vice versa...”*

The image of women who are always suffering, aggrieved and underdog due to her devotion to ethnic group or tribal order and sometimes obliged to be quiet, got changed across several series with female image, a “headstrong woman” who sets up the rules on her own and modifies traditions as a clan leader or under the matriarchal structure, or a powerful, cunning and intriguer woman in historical series (e.g. Hanımın Çiftliği (Lady’s Ranch), Kara Melek (Black Angel), Hürrem Sultan (*a figure from Ottoman Dynasty*)).

One model of the female characters in domestic series that TV broadcasters used includes the figures who are always oppressed, suffering, downtrodden and having few friends around (e.g. Fatmagül’ün Suçu Ne? (What fault could Fatmagül have?), Acı Hayat (Living Death), O Hayat Benim (This is My Life), Aliye (*a female name*)). From the early 2000’s, a new woman’s image reappeared that she was financially more independent, social, prestigious, having more active status and sometimes under the pressure of matriarchal structure.

“Females are used as sexual object particularly in magazine programmes or foreign series, and domestic TV series have more conservative image of women. Represented in accordance with Turkish traditions and customs, they are featured by their role of good mother and wife. In domestic series which portray the conventional roles of women, their real statuses are reflected in some respect.” (Büyükbaykal, 2011)

All these series have common point of non-concordant characters with normal course of real life, implausible, exceptional coincidences, non-fictionalizable unusual incidents, and unrealistic female characters. From the early 2010’s, gorgeous, attractive women with beautiful physical features are seen on the screen in the series. Female models who are care and make-up even when she has just got up, have luxurious autos, work for holdings and in plazas, and have no financial problems are embodied in series over the theme of love and affairs, and intrigue. These non-productive women who are not featured by their professional qualifications take place with the image intrepid, unabstainer from telling lies and obsessive to reach their goals.

“The characters (starred couples) in domestic TV series that permeate into our lives in the adventure of domestic series from past to present and deeply affect many parts of the society gain popularity with their lives of violence, loves and conflicts. Male characters of domestic series have got their women and envy them to die while female characters are always ready to sacrifice anything that they own any time. It means that they can immediately throw away their facilities and equipment that they have earned in life for the sake of their love. Self-sacrificing for their purity, family and children and fidelity are less than nothing for them.” (Özsoy, 2018).

The images included in communication codes of media apparently serve the conventional ideology consolidating women’s dependency and secondary status. A number of TV series broadcasted on prime-time lay emphasis upon the priority of the women’s roles relating to their home and family (Kalan, 2010:81).

In their most of life the individuals must have had at least one woman. People’s physical and psychological developments are characterized by the presence of women. Female in the figure of mother, sister and wife is the moulder of the set of behaviors which specify the social dynamics, are often learnt unwittingly and transform into characteristic structures.

There are sexual identities accepted by every culture, and their social norms determine how either one man or one woman should appear, act and relate to each other (Yılmaz, 2007:144).

Story line and distributed characteristic structures can be regarded as usual when considering the overwhelming portion of men in the group of senarists of serial films. However, the scenarios typed from men’s perspective sometimes may not represent as true the roles in life, the viewpoints to happenings, the situational assessments, and then character formation. This can also be one of the reasons why female image portrayed in the series is questioned.

The narrations that made by male story-tellers are the stories of man and mannishness that provides men with symbolic power. Modern communication instruments have an explicit role and been employed in functioning the gender-based process of representation and interpretation (Kotaman et al., 2011:78).

Findings And Conclusion

At between the years of 20 and 50, 10 females attended this study on “portrayal of the perception of women in domestic series and its comparison with the real-life women’s figure from women’s perspective”. The participants who are professionals and regularly watching TV (at least one hour a day) were demanded to answer the questions asked related to the perception of women in TV series. A proper environment was provided so that they can explicitly express their feelings and thoughts under no influence in response to the general, understandable and clear questions directed. The respondents’ answers were coded in the way of S:1 (for Speaker 1), S:2 (for Speaker 2), etc., and the given responses were examined with the method of content analysis and released below.

First a question was asked to the attendants such as: **“How is do you think the women’s model in domestic series represented?”** The respondents’ answers are such below:

(S:1) *“In TV series, there are female characters who are passive, directed and easily guided, and naive or lead any of their surroundings, try to figure all humans and events towards their request, desire to get their way and are quite malicious. That’s, a portrayal of character was made by power distribution; powerless women are portrayed as naive and directed, and powerful ones as ruling and villainous.*

(S:2) *“They are intrigue-oriented or meek/weak-oriented. The message in the intrigue-oriented group is the motto of “everything in love is fair” while those in the meek/weak-oriented need a man shakening and awakening her for meaningful life, actual renaissance, and controlled life. Apart from this main tendency, other side characters have its various levels in general. Triumphant women to gain a footing have traumas with accompanying and degrading somebodies and need a man safeguarding her to leave her troubles behind and become happy.”*

(S:3) *“The impression that I have got is that the theme in the series is usually, you know, that women who are downtrodden and uninfluent characters if it is Anatolian/chieftain/clan thematic one. In urban series, the profile of city women is such that seducers and coquette addicted to men or much intriguing and cunning females.*

(K:10) *“There are women’s models who we do not come across in real life. Too intriguer or too altruistic women”*

The respondents who assess the way of representation of female characters in domestic series made notable observations. Women are portrayed in series as passive, underdog, weak, battered, and tormented or intriguer, gossipier, and lustful for power over others. Or they can be perceived as meek, weak with a character whose course of life suddenly shifts when she falls in love with a well-off and powerful man and who must require a masculine body to safeguard themselves so as to make achievements in life and recover from her troubles. Out of current series with high ratings, the one named “Ufak Tefek Cinayetler” (Little Murders) has four starred female characters. The series narrates the life story full of intrigues and lies belonging to these women living a prosperous and luxurious life, and the character with the name of Oya the doctor, whose college and personal life is turned into a living hell after she is slandered by her friends, despite being an idealist doctor, is portrayed as meek, weak, and non-self-advocate. Expected to have a key status in social life as a doctor, the character of Oya is taken under his wigs and looks to him as a safe harbor not until she is in love with a married man, which is the result of the mentality to portray women as passive.

It is also not different for the series of “Sen Anlat Karadeniz” with high ratings. This is about the incidents happened to the character of Nefes who is sold for money to a man by his own father and tormented, and then took shelter in Karadeniz (Black Sea) and had much trouble. This series which is attention-grabbing with too many scenes of violence has been criticized by audiences for the reason of “normalization of violence against women”. The starred female character, Nefes, is portrayed as battled, weeping, tormented and exposed to many other misdoings.

The respondents have negative thoughts about **“the consistency of the model represented in TV series with the real life”**. One stated that extreme troubles and emotions are normalized and economic class is highlighted that the reality concept in the public have been changed and reshaped by senarists: *“I think many cases in TV series are excessive in quantity and exaggerated. Again they, I think, are trying to create sense of familiarity and normalize such extreme negativities as they make the public view all these hyperbolic violence and excessive negative emotions, thoughts and actions persistently. The stories always make arguments on the subject of social class that the problems and conditions of humanbeings are differentiated according to socio-economic classes as much as I see, that’s the emphasis is too much on the class issue. By keeping similar stories told, people’s sense of reality in the society is rebuilt or reengineered by senarists and producers every day ...as well as male and female character models.”* (S:1)

Another respondent pronounced that the life represented in the series has no association with the real life: *“These series lead to adopt the reality in different and nonconstructive way. It is seen as though the achievements are subject to that sort of actions. And also, they emphasize the discrimination in social gender roles and created an effect like single woman is somehow defect. On the side of men, a new identity of classical men that has appeared within the modern version of traditional masculine model help people internalize the role of dominance and determination.”* (S:2)

One of the respondents pointed out the gap between the female model portrayed in the series and the real-life women’s model: *“In my opinion, it’s irrelevant. We can even see this when we look at houses and settings that these serial films are shot. The culture of extravagant consumption is overwhelming in the series. All environments*

are luxurious places. The houses are not normal, they are like the residents of palaces or residences. Hidden ads are embedded into the series cause a bad impression.” (S:8) and another replied “Although the characters in the scenarios can be sometimes simulated to the women in the lives of ours or our friends’, the series include exaggerations: the characters may live on the edge.” (S:4)

The respondents replied to the question of “**How would you describe the characteristics of the females that you have watched in series?**”

(S:1) “They are characterized by a social class and power-focused structure. Exceptionally, there are some characters including the women wealthy but more naive as well as the others deprived but highly passionate and thus desperately struggling to attain money and power.”

(S:2) “Having to pay off being powerful, weak, dependent on a man to deal with drawbacks in her life, usually downtrodden if not an intriguing character, oriented towards being like extension to a man rather than being individualistic.”

(S:5) “The women sex-oriented, male-dominant, oppressed, male-dependent, femme fatale, secret plots in closer kinship, yenta, and low brow. In short, the females who got there using their intelligence are unlikeable and in supporting roles. Yet, it depends on the series. For example, I mostly like two series... I am watching them because they are preponderantly psychological: *Tehlikeli Karım* (My Dangerous Wife) and *Fİ*. The female characters in those series draw my attention.”

(K:10) *Beautiful, well-groomed, intriguer, self-sacrificing, lover, sneaky, brave, smart, gossip, hypocritical, two-faced*

The respondents make physical and behavioral assessment for the female roles in domestic series and highlight that women are intriguing, eagerly attached to a man, sneaky, self-sacrificing, highly courageous, downtrodden, dependent on husband, class- and power-focused, non-individualistic, weak, slim, beautiful, made-up, well-kept and manivured even if tormented. The warm-hearted characters are also represented as the secondary characters who are shy, diffident, and taking a backseat.

The responses to the question of “**What is the authenticity of the economic conditions of the women portrayed in the series?**” are such below:

(S:1) “The female characters’ economic attributes are characterized by the patterns of social and economic class. They are portrayed as being in the economic status, very high or very low. Apart from its trueness, persons in middle, middle-low and middle-high income groups have far less chances to be viewed on the screen, I think.”

(S:2) “By the fashion of poor girl to rich guy, which is considerably going on, a female character is featured, who sets for life by means of mad love of a wealthy man or makes a marriage of convenience with a rich person and gets out of her financial troubles. When she is possibly a woman who can stand on her own feet, she is in the position of paying a heavy price for it, being downtrodden, oppressed or isolated. Namely, there is like an inclination as if the woman had to receive a nasty blow from her safeguarding attached man in order to realize that goal.”

(S:3) *It doesn’t mean that plaza women all are making good money. We may sometimes see them in high managerial positions in plazas but this won’t shift the real thing. Dreams and Realities. With the theme of sub-culture, some series may be a bit closer to reality.*

(S:7) “Some are too rich or too poor.. There is no normal as family figure. Except for the series of *Çocuklar Duymasın* (Don’t Let the Kids Hear)”

(S:4) “The characters who generally mentioned in the series are financially easy and even sometimes got attention with their too much luxurious lives. They can be the exaggerated lives that do not correspond to the common social understanding.

To such question as “**What would you like the female character in series to be when considering their social contributions?**”, one replied “The female characters that I would like to view in the series are who come from any socio-ekonomik sub-structures in the society, are well-educated, coherent of their feelings, thoughts and actions, able to go through and cope up with their problems, suffering from their troubles without much dramatization, having positive personal characteristics, doing good things not only for themselves and their families but also for the community and the globe, working and earning their financial independence, self-aware and self-conscious as women, conscious of equal and democratic citizenship, and good role model to other girls and women in the society.” (S:1) and another respondent stated “*There are such studies on as human relations, mate selections, individuality, self-identity formation, sexual roles, etc., but they are informed exclusively to a certain part. These can unfortunately not be addressed to general public and reached out low socio-economic levels through transformation into real life form. The series need to be designed with experts’ views from psychology, psychiatry and sociology, and the findings are embodied with the serial characters. The message made by the series can be that in order to stand on one’s own feet and be an individual, there is no need to pay a heavy price for it, for plots or submission to realize it, and provide insight with how is making choice, awareness of gaining from freedom, and how one can be able to differentiate the useful alternative from the useless one.*” (S:2) Other respondents’ answers are such below:

(S:7) *“Firstly I would like the series to be genderles; that’s, without any discrimination of men or women, just a humanbeing. Women should have to stand on their own feet alone, intelligent, smart, and simultaneously funny. In other words, the female intelligence should be featured by the series.”*

(S:10) *“I would like to view females in the series who are workers, developers, good lovers, producers, readers and achievers while their sons and daughters must be happy mostly by such a women’s model. These perceptions should be focused in TV series.. affection and performance inside women won’t be oppressed but on the contrary will be uncovered.”*

(S:5) *“There should be female characters to be exemplar, away from twisting men around their fingers and exalted but not disparaged from men’s perspective.”*

Starting from all these observations, the perception of women in TV series have unequivocally great importance with its critical role in shaping the society. When considering the role of women in the development of individuals in the society, the responsibility that should be undertaken by TV serial broadcasters is overtly substantial. As a result of the present study, it has been observed that there are not significantly any similarities between the serial female characters and the real-life women’s figures. The female characters are portrayed as powerless, weak, whinny, under male dominance, or class- and power-focused, wealthy, ambitious, dominant, intriguing and with beautiful physicalities.

The respondents indicated that the female model portrayed in TV series are rarely consistent with the real-life women’s figure. It is observed that the incidents characterized by female characters contain exaggerated, extreme and negative emotions and these thoughts and actions have been gradually normalized. In the series, the reality is made to be adopted in a different and unconstructive way, and the presence of single woman is explicitly portrayed as defect in minds by emphasis of the discrimination on social sexual roles. Regardless their jobs, the females are represented as the characters who are safeguarded by men and finally, fall in love with him and so have a meaningful life. In the scenarios overwhelmed by consumption culture, female characters live in waterfront residences, villas in much luxury, or in shantytowns in destituteness rather than modest real-life models.

Those attending the study pronounced that the female image represented in the series is not authentic and re-engineered by producers. The female characteristics that they would like to view can be listed as: originated from any socio-economic sub-structures in the society, well educated, coherent in her actions, keeping in touch with reality, not dramatizing her troubles, having positive personality, working and financially independent, able to be a good role model for other girls and women in the society, not require paying a heavy price for being an individual, aware of not having to resort to any intrigue to deal with issues, producer, reader, intelligent.

Abstract

Interest of design professionals in Post Occupancy Evaluation (POE) is growing. Insights received from the POE can help informing the architectural design briefs. Therefore, POE has an important place in architectural education. Accordingly, Post Occupancy Evaluation (POE) is carried out with students within the scope of the elective Physical Environment Control course, which is taken in the 3rd year (5th semester) in Uludağ University Architecture Department since 2012. During the course, the concept of Post Occupancy Evaluation is given to students and then a questionnaire is prepared by the students regarding the key themes in order to evaluate user satisfaction. In this context, surveys were carried out with the users of various types of buildings such as education buildings, medical buildings, university campus buildings, public buildings, shopping centers, mosques, and light rail stations in Bursa. The results obtained from these questionnaires are evaluated statistically with percentiles and are then discussed and evaluated with students. In addition to the climatic, acoustic and visual comfort conditions of the buildings, positive or negative factors related to the design are being considered and it is aimed that these results will guide the students in future designs. Ultimately, it is considered that architecture students' opportunity to experience POE during their training will contribute to their professional lives by giving them the skills to create better quality physical spaces with optimum comfort conditions.

Keywords: *Architecture Education, Post Occupancy Evaluation, Building Design*

1. Introduction

Human needs are all the environmental and social conditions that enable users to maintain their lives in various ways (physiological, social, social, psychological, etc.) without discomfort and with the ability to be productive in their work (İnceoğlu, 1982). Because people spend a large part of their lives inside buildings, the quality of life provided to users is an important factor in meeting the human needs. After the initial usage of a building, where people live, work and carry out recreational activities, users understand if the building is able to fulfill their expectations in various fields such as space organization, functionality, technique and aesthetics, and this directly affects user satisfaction.

Architects have an important responsibility in designing a good quality of life for users and ensuring user satisfaction. Being able to respond to the needs of users is very important in designing and constructing successful buildings. Architects should design buildings with high user satisfaction based on the feedback they receive from users and should minimize mistakes in future designs. POEs are important for building performance evaluation, which helps to identify user expectations and existing problems in buildings. In architectural education as well as in professional architectural environment, providing students with POE experience will contribute to their professional lives by giving the skills to create better physical space quality. POE is handled differently in architecture education. For example, buildings' post-occupancy evaluation (POE) is carried out at Oxford Brookes University for more than 10 years. In general, the POE module runs in semester 1 over 12 weeks (and more recently 8 weeks) and is delivered through 12 sessions of 3 hours (36 hours contact time and 20 credits), combining lectures and seminars with the real case study building (domestic or non-domestic) to understand the cause and effect of both hard and soft issues on building performance. Students in groups of three or four conduct the POE of a building, thereby developing skills in teamwork and collaboration (Gupta, 2014). This paper describes importance of 'post-occupancy evaluation (POE) of buildings' into undergraduate teaching in Uludağ University, Bursa/Turkey.

2. Post Occupancy Evaluation

Post Occupancy Evaluation (POE) is an evaluation method used in many disciplines including academic literature, industry press and professional institutes. The first important work on post-occupational evaluation was conducted in 1960s in buildings such as in mental hospitals and prisons to observe some serious problems that seemed to be caused

by the structured environment. The evaluation of health, safety, security and psychological effects in relation to the usage of the environment were striking in these studies. In the 1960s, there have been an increasing number of studies on the relationship between human behavior and building design that led to the establishment of interdisciplinary professional associations such as the Environmental Design Research Association (EDRA) and the creation of a new field of environmental design research. Today, design professionals' interest in POE is growing.

POE offers an opportunity for assessing if architects in construction and architecture sectors are able to meet the requirements of buildings. According to Watson (2003), POE is an approach that can be conducted any time in the life course of buildings. Since 1960s, POE assessments were made for different building types (Preiser, 2002). Hospitals (DHFP, 1990; QHRS, 2001; Carthey, 2006; Ornstein et al., 2007), education environments (Evrin, 2010; Manahasa, 2017; SEE, 2005; Watson and Thomson, 2005; Mumovic et al., 2009; Tookaloo and Smith, 2015), convention and exhibition centers (Tanyer and Pembegül, 2010), offices (Voordt and Klooster, 2008), playgrounds (Moore, 1983), government and public buildings (Nawawi and Khalil, 2008).

Post Occupancy Evaluation is a building evaluation process where a building is evaluated systematically and regularly after being built and used. POE focuses on users and their needs, so that design decisions that have an impact on the design and construction of the building can be tested. As a result of evaluating the design decision in planning and comparing it with the end product, the strengths and weaknesses of the design can be determined. This information is transferred to new designs, while it is also used as feedback for the solution of problems in the existing environment. The knowledge gained becomes a basis for the designers for building better buildings in the future (Presier et al., 1988, Karagenç Onur, 2002). The knowledge gained in this process also creates a basis for designers for building better environments in the future. According to Preiser et al. (1988), POE's purposes are: (Preiser et al., 1988)

- To collect information on solutions to urgent problems in buildings,
- Helping to solve problems that are encountered by building users, which were not understood during construction,
- Providing useful information that will help establish the balance between the user and the environment during the use of the building,
- Accepting building-related situations as data and using such to resolve issues in similar types of buildings,
- To generalize POE related information for updating existing design criteria, compiling them in order to prepare guidelines for the architecture profession.

According to Kirk and Spreckelmeyer (1988: 162), post-usage evaluation activities are a set of techniques used by architects and environmental designers to determine how the environment is used by users, and also to determine the level of satisfaction provided by specific design goals. This technique has recently been used to establish criteria for planning new designs based on the performance of the environments in use. Accordingly, the purposes of the Post Occupancy Evaluation studies can be listed as follows (Kirk and Spreckelmeyer, 1988: 162)

- Use existing environments to shape future environmental needs and requirements,
- Testing program and design goals,
- With the knowledge on how existing environments are used by users, updating and adapting them to meet the needs.

Despite great efforts of architects and other specialists, and despite the large number of constructions, it is often believed that such environments are unable to achieve satisfactory results in terms of performance. This may be due to the fact that the usage of the environment is not monitored sufficiently and similar mistakes may be repeated numerously. During the usage of built environments, productivity may decrease, health and safety problems may arise, users' comfort and satisfaction levels could be reduced. These results have proven the benefits of Post Occupational Evaluation (POE) studies, have grown POEs' field, and led to the development of activities (Karagenç, 2002). Preiser (1997) has attempted to identify the fundamental problems of environmental performance using Post Occupancy Evaluation studies. Identified problems that are related to performance are listed below (Preiser, 1997: 179).

- Health, safety and security issues,
- Comfort problems (poor thermal control and air circulation)
- Aesthetic problems

- Surface maintenance problems
- Waste of energy
- Poor image and direction finding problems
- Leakage problems

Whether it is related to technical, usage or behavioral criteria within the environment, understanding these problems are a step towards the solution of problems. This underlines the importance and utility of the use of Post Occupancy Evaluation studies. The utilization process and the size of the impact of the benefits arising from Post Occupancy Evaluation studies can be considered in three terms (Preiser et al., 1988)

Short-Term Benefits: Short-term benefits emerge as a result of the use of POE findings. In the short term, achievements and failures regarding environmental performance are identified and recommendations are made for problems to be solved. Additionally, Post Occupancy Evaluations' another short term benefit is related to dealing with problems arising out of budget cuts for reducing costs. Trying to keep project costs low usually lowers environmental quality. Post Occupancy Evaluation allows for higher quality and performance building production with lower costs. The short-term benefits can be summarized as follows: (Zimmerman and Martin, 2001).

- Identifying and solving space usage problems,
- Considering the issues that will increase the efficiency of the employees working in the area,
- Evaluating user opinions, who actively participated in the evaluation process,
- To make informed decisions and to better understand the results of the design,
- Establishing a relationship between budgetary constraints and performance.

Mid-Term Benefits: POE can provide solutions of identified problems in the building such as rearrangements, remodeling, and adaptation or can provide databases for larger constructions. Accordingly, mid-term POE benefits are related to the main decisions regarding building construction. Mid-term benefits are; (Preiser, 2002).

- Reducing costs in the process of construction, use and repairs,
- Providing opportunity to the designer to take part in the evaluation of space performance,
- Adaptation of functions to suit the new space usage for the changes to be carried out in time.

Long-Term Benefits: Long-lasting benefits are those that surface in 3-10 years after information on success and failures regarding the performance of the built environment are learned and applied to design of buildings to be built in the future; this POE benefit is related to architectural environments, such as hotels, office buildings, schools, and residences. Long-term benefits are; (Preiser, 2002).

- To produce measures to improve space design and construction quality,
- Making long-term cost plans,
- Establishing databases, standards, criteria and guidelines, and developing existing ones.

Reviewing users' satisfaction level from buildings is a common approach that aims to increase the efficiency of existing buildings and to guide future designs. In this regard, the Post Occupancy Evaluation - POE system has the following benefits as explained in "Post-Occupancy Indoor Environmental Quality Evaluation of Student Housing Facilities";

- Determining building problems and solutions in a short period of time,
- Enhancing building performance and feedback related to usage,
- Creating important costs savings during construction and the building lifecycle
- Creating long term improvements in building performance
- Creating a knowledge base for improving databases, standards, and criteria (Hassanain, M. A. 2007).

Although designers and customers benefit to a great extent from POE activities, the POE approach is not routine in design-project stage because of the following,

- POE costs are high,
- POE research is time-consuming,
- The designer or project owner does not want the mistakes to come to light (Evrin, 2010).

3. Method

The data collected with POE is believed to assist designing new buildings and will also assist implementation of new arrangements for existing buildings. For this purpose, Post Occupancy Evaluation (POE) is carried out with students within the scope of an elective course, which is taken in the 3rd year (5th semester) in Uludağ University Architecture Department since 2012. During the course, the concept of Post Occupancy Evaluation is given to the students and then a questionnaire is prepared by the students regarding the key themes for evaluating user satisfaction. Every 3rd year (5th semester) architecture students conduct surveys with the users of various types of buildings such as, education buildings, medical buildings, cinemas, university campus buildings, public buildings, shopping centers, mosques, and light rail stations in Bursa.

Surveys are one of the most effective methods to obtain a wide range of information (Zimring, 1987). Since the purpose of a survey is to measure how people interacting with a particular environment react to it; it is important to reach the largest group that interacts with the environment and learn their ideas. The results obtained from these questionnaires are evaluated statistically with percentiles and are then discussed and evaluated with students. In addition to the climatic, acoustic and visual comfort conditions of the buildings, positive or negative factors related to the design are being considered and it is aimed that these results will guide the students in the future designs. Figure 1 shows the workflow of carried out with students for post-use evaluation.

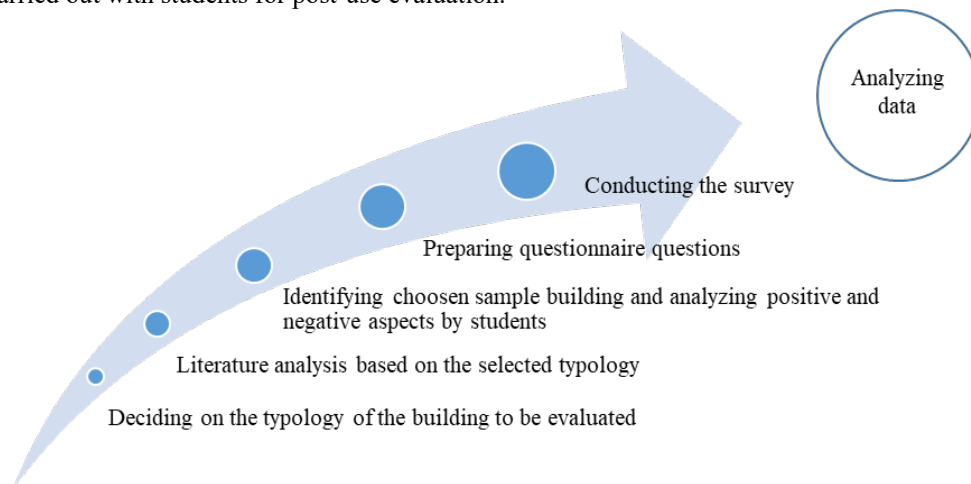

Figure 1. Workflow Chart

When the workflow diagram is examined it can be seen that the first decision is about the typology of the building to be evaluated. Students focus on buildings that they use, and that they will be able to experience the positive or negative aspects. In the second stage, a literature analysis is made on the selected typology and national and international studies to date about these buildings are examined. In the third stage, students are asked to do a study to identify the sample building they choose. It is expected from the students to observe and identify the problems or positive aspects about space setup, interior design, transportability, accessibility, ergonomics, thermal comfort, acoustic comfort, visual comfort, indoor air quality, service areas etc. After conducting preliminary studies and researching existing questionnaires related to the subject, work starts on the preparation of questionnaires for the subject. Although the prepared questions differ according to the type of building, the topics in Table 1 are questioned in general.

Table 1. Evaluation Criteria

Transportability	Pedestrian access to the building
	Perception of building entrance
	Position of building areas
Accessibility	Accessibility between storeys' circulation areas
	Ease of access to units
Ergonomics	Indoor storey height
	Size of windows
	Width of stairs and height of risers
Thermal comfort	Indoor temperature in summers
	Indoor temperature in winters
	Usage of artificial air conditioners
Audial comfort	Audial comfort
	Noise from installations
	Outdoor noise problem
Visual comfort	Natural lighting
	Artificial lighting
	Color preference
Indoor air quality	Natural ventilation
	Indoor air quality
	Odor problems in wet areas
Service areas	Catering and resting areas
	Wet areas
	Car parks
Socializing	Areas that enable social communication
	Open areas, courtyards
	Green areas that enable socializing

After survey questions are prepared, students are asked to conduct the questionnaires in groups of 2-3 people. Users evaluate satisfaction conditions, importance and performance of buildings using scores under between 1-5. 1 indicates “lower importance” and “poor performance”, and 5 indicates “higher importance” and “better performance”.

After the questionnaires are conducted, they are evaluated in the Excel program and the results of the questionnaires are revealed. The evaluation process of the questionnaires is transferred to the students in a simple way and the results can be easily transferred into percentages and graphs.

After the results are revealed, user satisfaction questions are reanalyzed and scored again on a 5-point Likert scale, which indicates the satisfaction or the importance level (very satisfied, satisfied, neither satisfied nor dissatisfied, dissatisfied, dissatisfied and can't choose).

In accordance with the survey data, the level of comfort score was voted within -2 and +2. Negative scores indicate user's dissatisfaction (negative points) and marked with bold characters, while positive scores indicate user satisfaction (positive points). The overall evaluations of case studies are summarized below in the Table (Figure 2).

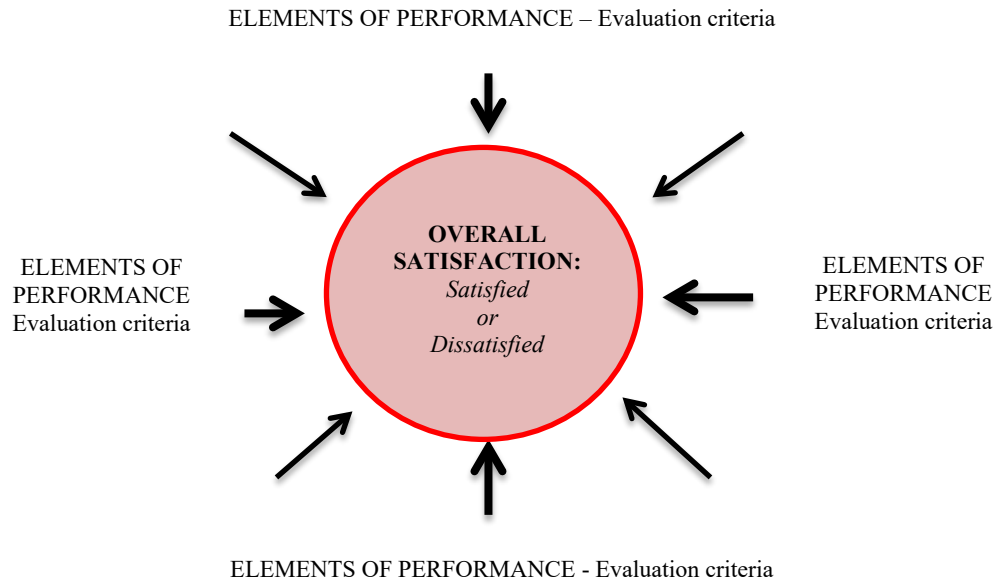

Figure 2. POE Evaluation Chart

As a result, satisfaction levels of users are determined under each of the performance criteria. Additionally, the respondents are asked open ended questions to evaluate the optimum comfort conditions of the buildings that they use to determine positive and negative performance characteristics of buildings. At the end of the study, students discuss what they can do in the design phase regarding the performance values that the users feel dissatisfied.

4. Conclusion

POE allows students to undertake thorough real-world research. POE studies are useful tools for generating evidence and feedback that are required for learning lessons from buildings. POEs also provide a valuable specialist skill in understanding and evaluating building performance, in relation to their own design and that of others, particularly for students that will be architects of the future. By strategically aligning POE and design studio, the gap between design intent and actual reality can be addressed.

In addition, students will be able to see and analyze different types of structures in place and examine problems faced by users, and consider the problems they encounter to support solutions. Also, students are encouraged to do research and gain experience in group work. More advanced levels of POE are supported in order to achieve more scientific and precise results by introducing the SPSS in the graduate programs.

According to the feedback received at the end of the course from students about their work, it was seen that using POE systems prior to the design phase was considered by the students to contribute greatly to the prevention of mistakes in design. It is apparent that because of all its positive contributions, introducing the POE system to the students in the architectural undergraduate programme and conveying it to students with examples will contribute positively to the architectural education process.

Abstract

Today's technologies show unique potentialities in education. How can virtual / physical interweave add value in education? In an attempt to find an answer to this question, we carried out an analytical study that predicts to investigate hypothesis previously elaborated in order to find elements that allow us to verify if the augmented reality can be an added value for the school manual. A focus manual on the study of Portuguese and the environment was taken as a focus. We start from the following hypothesis: application of augmented reality adds value to the textbooks. The study is being prepared to be applied to primary students by trainee students in the context of initial teacher training. In this context, we intend to look at school textbooks, articulating them with the curricular goals and the student profile for the 21st century in order to understand the potentialities of augmented reality. Examples of use are presented. The results confirm our hypothesis and reinforce that the inclusion of augmented reality adds educational value: it promotes methodological renewal by changing the profile of student and teacher in the sense of promoting a connective and circular education with a focus on the student who produces his own knowledge.

Key words: *Augmented reality, Methodological renewal, Initial teacher training.*

Introduction

We grew up with the idea that in the year 2000 the world would end. In reality, the Normal Science that Kuhn (2009) called the phase accepted by the scientific community was broken by the appearance of enigmas that the traditional paradigm could no longer solve. This anomaly of persistent puzzles is giving birth to a new era with projection in the digital world, so we live an era of transition to a new world. In this age, we have not yet been able to detach ourselves from physical elements that were as important in our lives as the physical textbook, but we began to rethink how to transform them. The new generation of children entering or going to school are actually different in their cognitive and emotional characteristics, in the way they live life, in their interests and motivations. Citing several authors, Roberts (2010) defines this generation that has grown up exposed to ICTs and, therefore, experiences skills that make it suitable for the simultaneous use of multimodal digital resources that connects it with the world, as a generation that values the process collaborative learning, often networked, struggling to learn from traditional methods and with a limited one-size-fits-all program.

Effectively, current technology can favor the leap into the new era, for its potentialities and opportunities to develop skills base for current citizenship. But technology is not enough, education professionals are needed with a vision of the future of children's lives, change-conscious professionals and social and economic trends, aware of today's child psychology and innovative experiences in education that have already took place in pilot schools or small niches. It also needs reflective, innovative, creative, enterprising and constructive professionals who reflect on the new methodologies, taking from them ideas to experiment, deduce and recreate, that move towards the mission of contemporary education in line with real life, inclusion of current technologies should provide meaningful learning for the school and for life, in addition to being able to read, write and count. This articulation with life imposes a knowing and being cognitive, emotional, relational and organizational, so there are important skills in this new century as they define the profile of the student (Oliveira-Matins, 2017, OECD, 2005).

In addition, it is in the real relationships between people and facts that learning becomes more meaningful, so that the school should not be limited to its walls but overflow to the world by immersing in it, its problems, anxieties, conflicts, desires and dreams, and emerging with solutions and preventions, knowledge and skills of adaptability, recognition, flexibility, creativity, intellectual and moral autonomy for proactivity in personal, academic and social life. In the latter context, Pascoal (1999), based on several studies by Piaget, reinforces that in the interaction of assimilation with accommodation guided by self-regulation, intellectual autonomy is emphasized, and the child is

not satisfied with a methodology based on memory passive because he feels intellectual curiosity and wants new ways of solving everyday problems, thinks about propositions and not only about the experience provided by concrete objects, raises hypotheses, privileging the formal aspect of thought. Moral autonomy, however, refers to their critical capacity vis-a-vis situations, becoming aware of decisions, of respect for the other.

In this scenario, the textbook can be a limiting element of education if the teacher does not release his / her potentialities through active methodologies and resources that enhance value creation in education to train citizens capable of producing creative ideas, not just repeat what is written by other generations, in other contexts. There is, therefore, a need to open spaces for the student to affirm his / her change of interaction with the environment, developing problem solving skills to produce knowledge, that is, to move from the concrete intelligence that interacts in the real to a formal structure, the content, knowledge (idem).

When looking at the primary school textbook, there is a physical and digital model. Both models respond to the logic of the press culture characterized by packaging information, ideas and organized knowledge and assume a standardized curriculum development model and in mass, that is, reveal six characteristic challenges of the twentieth century: model of expository and receptive teaching, material structured and self-sufficient for curriculum development, cultural industry product packaging, cultural object of press technology, encyclopaedist organization of knowledge, resources mediator between official curriculum and educational practices (Area, 2017). However, in Portugal the model in digital format, despite being a replica of the previous one, already begins to give the first signs of change: it allows access to an avatar with information, in the case of the Portuguese area, for example, grammatical, text structure, with access to PowerPoint and interactive fiches that can be stored in the platform or in the student's own folder; in the case of the Mathematics manual there is the possibility of performing interactive exercises with possibility of correction and conclusive information; Media Study allows you to access interactive content exploration and explanatory PowerPoint images. This fact, compared to the framework of a few years ago (Quadros-Flores, Ramos & Escola, 2015), shows a positive evolution, but still does not allow the student's collaboration in the manual itself which remains closed in its contents and possibilities, despite of interactivity with a view to consolidating knowledge. Some authors point out the importance of interactivity as a determining factor in learning Matas (2011) the need for the living book, which facilitates the updating, that includes tools that allow the student to collaborate, be multimedia and interactive and foster a free navigation through hypermedia Adell (2007), which has social life, which is dynamic Vershbow (2006). This view of the book can be associated with the school handbook by showing more the process of construction in time, open and flexible, adaptable to the group of students and the educational network that becomes active, than the finished, static, closed and limited product.

In Portugal there are platforms that complement the primary school textbook, namely the Virtual School (Porto Editora group) and 20th Digital Classrooms (e-LeYa group) and, according to Quadros-Flores, Ramos and Escola (2015), they rely on pillars in which they aim to improve the results of the children: the organization of the work of the teacher in the level of the planning of classes, of the group and of the work accomplished and evaluation tests; support to the teacher and student through multimedia resources that stimulate vision, hearing and interaction, such as animations, playful and interactive activities, videos, games and concept maps; communication between peers and teachers, chat, forum and sending documents / classes built; other features outside the platform. They amplify the potentialities of the textbook, so the authors (idem) show that they represent the first phase of change in the textbook. For Area (2017) the change lies in the crossing of different areas: in the artifactual or technological dimension, teaching and student functionality, in the processes (pedagogical object) of production, distribution and consumption.

In this evolutionary process, we arrive at Augmented Reality (AR) as a didactic resource that encourages more radical changes in the school manual and, consequently, a change in the child's attitude towards the learning process, a change in the teacher's attitude towards the opportunities of development of skills in the child, more pronounced methodological change, change in the opening of the school to the world and the world to school. It is emphasized that augmented reality can be a driver of the shift from the traditional model to the creation of a dynamic, open, personalized, daring learning model in creation and production, collaboration and network learning, focusing the learning process on the child. According to Matthioudaki and Ioannidou (2018), augmented reality is very promising in improving the teaching and learning process, since it allows learning beyond the curricular boundaries, redefining space, time and resources and that benefits the learning environment as it increases flexibility and interaction in learning activities by ensuring continuous learning. It also promotes immediate access to a range of relevant, collected and shared information from different applications (Yang & Yuen, 2012). In fact, the AR, by allowing the interactive interface of elements of the world with virtual environments (Cobo & Moravec, 2011) and simultaneous exercises in real time, captures the child's full attention in the learning process, facilitates the understanding of the world and things, promotes ubiquitous learning with

stimuli of immediate interaction and moments of decision. Downey (2016) proposes a multiplicity of possibilities for the use of AR in art, architecture, safety, sports, education, medicine, advertising, transportation, and other domains, showing that AR has potential not only in the learning, but also in the daily life of individuals.

This article presents a critical and reflexive thought about the potentialities of augmented reality in education, namely in the school manual. It aims to present augmented reality tools that can be an asset in the use of the school manual, reflect on its potential, and exemplify how the virtual / physical interweave adds value in education.

Methodology

An analytical study was designed to investigate hypotheses previously elaborated in order to find examples of augmented reality that could be an added value in education. The textbook of different curricular areas was taken as the focus of the exposition. We start from the following hypothesis: application of augmented reality adds value to school textbooks by allowing (1) child participation, (2) integration of other resources by teacher and by the student (3) involvement of other education actors the real and contextual world, (5) the development of skills other than curricular (6) curricular articulation (7) methodological change. We reinforce that the study is being prepared to be applied to primary students by trainee students in the context of initial teacher education

Thus, in this article we suggest some AR tools and possibilities of articulation with different curricular areas in the primary education (a). We also present some practical examples of use in the school manual, as well as experiences already used in real context (b) by trainee students in the context of initial teacher training, Supervised Pedagogical Practice.

Findings

(a) Augmented reality as a regenerative potential of curricular and contextual integration

The Order of the Ministry of Education 5908/2017 reinforces curricular flexibility as a means of promoting quality education, that is, it encourages effective and meaningful learning, which stimulates the consolidation of knowledge and its mobilization in concrete situations in order to foster a successful citizenship in the context of the challenges of contemporary society. It is also in this context that the need to develop competences designed in the student profile (Oliveira Martins, 2017) is framed in a transdisciplinary educational environment that involves not only curricular knowledge, but also abilities, attitudes and values. Thus, it is expected that the student who develops scientific knowledge in the curricular areas, acquire cultural and artistic training, possessing empathic capacity, critical thinking, communication, creativity, autonomy and intellectual, moral maturity, intervention and digital literacy, that is capable of integrating knowledge, solving problems, mastering different scientific and technical languages, cooperating and collaborating and having aesthetic sensibility. In this context, AR assumes a relevant potential for the development and implementation of innovative teaching approaches, namely the ability to research, analyze, understand, select, integrate, argue, produce and share. Surfing on the Internet we can get free applications that require only a *Smartphone* or *Tablet* with *Wi-Fi* connection and that reveal potential for change in education. Taking into account the curricular contents of the primary education, table 1 presents some examples of potential use of augmented reality in educational context.

Table 1: AR as a regenerative potential of curricular and contextual integration

Pokémon Go	The search for little monsters through the streets of the city, the neighborhood or in the school space, can provide a visit to the city: its monuments, gastronomy, culture..., while at the same time highlighting dangers, safety signs, community intervention projects, multiple public and private institutions, urban media, community spaces, commerce and institutions, comparisons with twinned cities... that could be the input of debates, the realization of intervention projects for the encounter of local solutions, study of geography and history, use of maps and their recreation, of posters and infographics, being able to stimulate the reading of texts, of works, news and the recreation of these in books online. In addition, it can awaken the study of distances, the design of angles, geometric figures, estimates and costs. Looking to the nearest space, the neighborhood and the school, triggers the deeper knowledge of the place stimulating positive interrelations with the school community that the game itself promotes in articulation with the areas of physical and motor expression, dramatization, plastic arts and music. In addition, in the interaction game there is space for developing the foreign language.
AR Dragon	The possibility of feeding your pet can provide a reflection on the food: what foods, how to cook, hygiene care, food validity, table presentation, meals, causes and effects of healthy / unhealthy eating, estimates, article reads and post-sharing text writing. It also allows the

	knowledge of self and others to draw up graphs and to carry out objective, coherent and communicable analyzes that promote the development of the capacity for reflexive and critical reasoning that can give rise to intervention projects with immediate effect on children .
Google translator	The possibility of pointing a smartphone camera to signs, pamphlets, publicity, papers, restaurant menus and immediately accessing the translation can promote the learning of foreign languages.
Quiver	The possibility of digitalizing children's works in printed cards that are acquired on the Internet and of magically giving them life in 3D digital environment, integrating image, movement, audio and interaction, allows the creation of emotions in children and can be articulated with different areas: plastic expression, study of the environment, including history and geography, Portuguese, mathematics and foreign language. The possibility of photographing, or filming the experience of reply to an interactive questionnaire, interacting and playing with the characters, stimulates methodological and playful renewal in learning. It is unfortunate not to allow the user to create the questionnaire. Also, the possibility of deciding, given the choice of the place of visit, allows developing leadership, decision-making, argumentative and critical thinking skills and cooperative work, as well as stimulating project creation and curricular flexibility.
WallaMe and AR Geocaching Game	The possibility of leaving hidden messages anywhere in the world allows contact with the world and its knowledge, its history, geography, culture, nature and society, by which it stimulates contact with the world, thus the development of language and communication, consequently promotes reading and writing, the ability to question, digital literacy, mathematics (measures of greatness, money, and other essential mathematical instruments in the study of phenomena) the development of culture, communication, geography, creativity .
Qlone	The possibility of scanning an object and inserting it in 3D form opens the child to complete their manual with real-life things with materials they have built in the area of plastic expression, musical, mathematical, and science.
Aurasma Reveal	- Viewing videos and images overlapping the physical element allows you to pinpoint objects and respond to gestures interacting with virtual objects. In this way, it stimulates the creativity of the child and the teacher in order to demonstrate how they understand the world, or the content to be dealt with in the school manual, promoting the articulation and curricular flexibility, the development of collaborative projects.
QRCode	The ability to create two-dimensional barcodes, easily digitized and transformed, alters the way the child interacts with the world and broadens the possibilities for dialogue of contents and curricular areas, materials, interlocutors in education, customization and methodologies.

This table with AR tools shows the possibility of a new era of the school manual in a new educational scenario where learning has meaning and can provoke emotions. By deflating the traditional orientation from the simple to the complex, in a line of clear continuity from successive stages to an end, new openings are possible that, according to the pertinence of the content, mix the capacity to understand and to realize it, of the interest and comprehensiveness of the curiosity, creative and entrepreneurial capacity and organization of educational practices in the sense of promoting opportunities for student growth, always bearing in mind the expected objectives / competences in the respective year of schooling. In a transdisciplinary environment it is possible to associate active methodologies focused on the student and the learning process stimulating their involvement and commitment, the motivation and the desire to improve, therefore the satisfaction. Examples of active methodologies are *Gamification, the Flipped Classroom, project-based and problem-based learning, and peer-to-peer learning*.

(b) The augmented reality experienced in real schools in a context of internship in the initial formation of teachers: experiences and results

In the context of initial teacher training, in an internship situation, future teachers applied AR tools in their

educational practices. It was verified the enthusiasm of some in the organization of the lesson plan, but also the technical difficulty of others in the use of the tool. By stimulating the institutional supervisor of the student trainee creativity, some fantastic successful experiments were possible not only because they promoted enthusiasm and emotion in the trainee student, cooperating teacher and children, but also because it surpassed the imagination of the various educational actors, having immediate effects on satisfaction of children and learning outcomes. Here are some concrete examples with evidence:

- (1) The child had access to the printed sheet of Quiver and colored the images and interacted through the program (Figure 1). Listening to the sound of the plane and watching it fly in space you can select cities to visit. The course is recorded and inserted in the school manual through the *Aurasma*. It motivates the development of the theme "media" in the study of the environment in articulation with the development of skills of the student profile. Wanting to extend the approach, for a matter of time, was not possible, a project was then developed on cities and their cultures, tourism and globalization. Depending on the level of education and guided in a *WebQuest* articulated with Google Drive (as a collective repository of the class), children can access brochures from a travel agency, for example *eDreams* learning to book trips and being aware of their values, *Google Earth*, to *Youtube* by selecting videos that help you understand the topic you are studying. They can access texts, books, news, music, relevant document sources and integrate all the information collected in *QR Codes* that will be attached to the school manual. They can also take artistic forms, in appropriate applications, compile the information into keywords, or into a concept map. Working collaboratively, an online book with the tasks performed by the various groups is attached to the school handbook using *QR Code* or *Aurasma*. These tasks should be performed by children.

Figure 1 Activity with Quiver

- (2) The child selects a video on *YouTube* and integrates it into their manual using *QR Code*, but can share it with their colleagues. Provides a *QR Code* to your colleagues to voluntarily decide whether or not to attach to your manual (Figure 2). The trainee student integrated questions to stimulate understanding of the text and a knowledge verification / consolidation quiz. Also these features can easily be shared with the pairs (Figure 3). Eventually the tendency of the publishers will be to assume this hybrid possibility of school textbooks by providing resources through AR. If this happens, it will be a good help to the teacher by freeing him or her for other tasks. However, the teacher should also add resources and guidelines made by him / herself and appropriate to the class and, above all, open spaces for children's collaboration in school textbooks, giving them the opportunity to customize them for the children and other actors they select. They are the children who must research, select, add, connect, produce and, if possible, share.

Figure 2 Integration of QrCode by the student

Figure 3 Integration of QrCode by the student

- (3) During the experimental science class, where the child used different soil samples to verify their permeability, each had the opportunity to access information and challenges through AR (Figure 4). This information and the activities they have performed in response to the challenges can be attached to the middle school textbook. After the children learn how to use the technology (*Aurasma / Reveal*) they can search, according to their interest, need and rhythm, can create text or book online, include in their school manual using AR by customizing it.

Figure 4 Access to information during class

- (4) The school manual itself served as the basis for this activity through the tongue-and-groove "The sink and the kite" (Figure 5). In this specific case it was the trainee student who, for a better understanding of the text, integrated movement (drip fell from the sink to the chick's beak), and video (the birth of the chick). There are two essential points in the process of learning, meaning and emotion that have been experienced in this experience. The children and the cooperating teacher were fascinated. The children were able to develop creativity in the field of orality, imagining the sink and water drip, what the chick felt, what the function of the sink, why it drips in the sink and what happens to the water drip when it enters the chick's beak. They were able to write a registration form by completing the character's balloons and a tongue-and-groove that was played through *incredibox.com*. All this can be attached to the manual through AR. By observing the birth of the chick, they can articulate the knowledge of the Study of the Middle by creating a research project: how birds are born, incubation of eggs in the hen (time / duration), growth of the chick until it is rooster, physical characteristics, mobility, reproduction; of mathematics: estimates, measures of length and time, masses, money, representations of sets and data. Children should learn to use AR resources to freely use at school or at home. The collection of information on the subject studied may be free or oriented, but it is important that they select the best resources, arguing the decision,

to be attached to the school handbook. Example of this suggestion is to access the AR through her selecting and interacting with character, in this case an animal (Figure 6)

Figure 5 Access to a video and water drip movement from the sink. Figure 6 Access to animals through AR

- (5) In this activity, in an environment of discovery and collaborative way, the children observed and felt, touching the rocks and registered their characteristics. Each group showed to the others, what they learned by stimulating dialogue and scientific foundation, and the presentations were recorded. The children learned to use the AR application, integrated the videos in the school manual, or registration forms, and held a final debate on the topic of critical and argumentative thinking (Figure 7). It is important to leave open possibilities for children to recreate!

Figure 7 Integration of a video, made by the children, related to the work developed

Conclusions

In an "augmented" world, reality merges with digital objects immediately, interactively, and in three dimensions. This overlapping of virtual information to the physical elements of the world, such as the case of the school manual, when and where we want, changes the way we learn, what we learn, when and where we learn, articulates the formal and the informal, the playful as a didactic tool and develops digital literacy skills among other transversal and fundamental competences in the contemporary world. In addition, it changes the attitude and connections with the world, by which it alters the student profile: collaborator in the construction of didactic resources, in an individual and collaborative way, critical and creative entrepreneur, self-regulator of learning, responsible. In this environment, learning becomes increasingly social and organic, seen as transformative.

Learning to learn in a more open social model, where challenges open paths to groups and individuals, and these travels driven by common and individual interests and objectives, in the most varied directions, presupposes growing up in an environment of connections where children reveal the interpretation which have on the curricular content studied through selection of added resources, this selection being the mirror of the construction of their world, reflecting their emotions and sensitivities. Knowledge is thus a process built in an environment where the child moves with dynamism and interaction, mobilizing theory in practice accompanied by reflexive processes.

If one day the AR is able to integrate a multiplicity of technological equipment, we can talk about sustainable circular education. Given that we are in a transition period, it seems to us, however, that this connectivist tendency (George Siemens, 2005) must be accompanied by the teacher's attention to converge with the objectives for the year of schooling, since the chance encounter of selections pedagogy for children can lead to the dispersion and difficulty of understanding and building meaningful learning. Thus, the teacher assumes a fundamental role in the selection of technologies and methodologies that promote the development of thought and interaction, guiding the child in his / her growth process and understanding of the world, of himself and others, helping to think critically, produce and share knowledge and resources in the sense of connectivity, creativity and circularity.

This study confirms that AR encourages the participation of the child, teacher and other actors in textbooks and interaction with the real and contextual world, which promotes curricular flexibility. In fact, AR has the potential to change the pedagogical action of the school manual to the level of transmission, the organization of units and sequences of learning, transforming the physical school manual, as we now conceive it, as it overlaps the digital, adding value to the process of construction and recognition of knowledge patterns, the possibility of developing skills and evaluation parameters, revealing that it is a process to be developed rather than a tool to be applied in relation to digital technologies, as Castells (2000) states. Thus, it requires the teacher creativity to find diversified strategies and opportunities that respond to the needs and interests of the students and that expand spaces and moments of learning of the children for the children.

This scenario differs from the image of education 1.0, very artisanal, of 2.0 already more collaborative, approaching 3.0 where the recognition of change is a reality that imposes proactivity of the educational agents to a circular education focusing on the child who produces the information it needs. This educational sustainability favors the adaptability to the student's environment and autonomy. As a conclusion, augmented reality promises profound changes that make the manual innovative: it changes the possibility of the learning structure according to the child and the context, so the static, limited, transmissive school manual becomes more open, comprehensive, questioning, interactive and shared; it changes the possibility of more distributed and connective and less organized articulation; changes the opening of the book and the ways of teaching to learn to learn, more constructivist and collaborator, by which changes the profile of the student, teacher and learning methodologies and adds the possibility of developing skills and emotions in the learning process.

Abstract

In this paper, the authors try to find answers to questions relating to the selection of solved examples from the Single Variable Calculus field that could evoke positive motivation in students of economic and security disciplines at universities in their studies of Mathematical subjects. They concern the dependency of the selection of examples with respect to the timing of their presentation in the tuition process; at the same time, as the question of the adequacy of these examples with respect to the students' level of knowledge in their first year of studies. At the end of the article, some demonstration examples are mentioned, which contain Single Variable Calculus applications that require a knowledge of only the most basic parts of the given subject matter. Therefore, these not-too-difficult examples can be used - as the authors hope, for the eventual interest of other users at other universities with Engineering disciplines.

Keywords: *Mathematics tuition, motivation to study, Single Variable Calculus, examples, universities with Engineering disciplines*

Introduction

When selecting a sample of solved examples for this contribution, we were aware that each selection of such examples is a subjective matter. Nevertheless, we shall present some experiences that could - despite the subjectivity of the selecting examples, contribute both to the quality of the afore-mentioned examples as well as to the well-timed motivation of students to study mathematics.

The greatest advantage of the selected sample examples, where complex mathematical tools are not used, and which - at the same time, are a bridge between mathematics and the specialist subject matter is that these examples can be used in the early stage of mathematics lessons, or at the beginning of a certain mathematical topic. When motivation does not take place in time, it will lose much of its effect. The proper and immediate understanding of mathematical application examples will also make a significant contribution to increasing the self-esteem of some less gifted students.

It is also important to have the widest variety of samples which motivate an understanding of the solved examples - both in terms of the content of specialized topics, and the range of mathematical or geometric skills used.

Feedback can certainly help to reduce the subjectivity of the selected examples chosen by the teacher. In order to acquire these skills, it is necessary to do several research surveys in the tuition process whereby students will evaluate individual examples.

Now, let's mention a few experiences that can contribute to the quality of the form of the text. The mathematicians concerned should consistently use a valid international standard (International Standard ISO 80000-2: 2009); which defines the writing of mathematical symbols in the examples and all the lessons, and which is always implemented in individual national standards. Experience to-date, has shown that many mathematicians do not use these standards consistently when writing mathematical teaching texts. The excuse for this fact can certainly not be that every editorial office of mathematical or other journals has its own requirements for writing texts with mathematical symbols - which are often determined by tradition.

Each figure should have its own concise description of the situation which it displays. Coordinate axes - and in particular, coordinate axes in three-dimensional space, should be oriented such that they should be ended with arrows. This should also - where possible, be if it is a graphical output from a computer algebraic system (e.g. Maple, Matlab, Mathematica, etc.), and the figure needs to be completed by using other software.

In this sample of presented and solved examples, each example has its concise name with the use of keywords, which are clearly highlighted in *Italics*. The example name contains and highlights those key mathematical terms that are applied, as well as those highlighted technical terms that must be used in the particular example. Thus, the example name represents a certain abstract of the whole example and is valuable both for the better orientation of the teacher and that of the student.

If it is necessary to explain some of the technical terms, then it is advisable to do so immediately after setting out the example, and to place these explanations in the marked remarks. It is sometimes useful to summarize the result obtained in the example.

Although some examples can be very closely related to each other, it is prudent to try to formulate them from the start - in a relatively independent way. For future changes to the sample examples, it may be helpful not to use references to other examples in the text.

Experienced educators, including the authors of this contribution, do not consider the presented sample of solved examples as being definitive. The authors are convinced that attractively formulated solved examples – with the right timing, will always “spice-up” the tuition process.

The Study

Nowadays, Single Variable Calculus is a classic mathematics teaching topic in most of the final years of secondary schools. In this teaching text, the central concept is the limit of function. Euclides of Alexandria, ($\pm 365 - \pm 300$ BC); and in particular, Archimedes of Syracuse, (287-212 BC), used the limit of function in a simple form. The limit of function - as the most basic concept of mathematical analysis, was defined in the 17th Century by the Englishman, John Wallis, (1616-1703); but it was not until the Czech mathematician and persecuted philosopher and priest - Bernard Bolzano, (1781-1848), the Frenchman, Augustin Luis Cauchy (1789-1857), and the German, Karl Weierstrass, - 1897), who introduced the concept of Limit consistently into mathematics. Without limits, is hard to imagine teaching mathematics today. But, understanding the concept of the limit is a rather difficult issue.

The first example in this paper is also devoted to applying limit processes to derive a formula for continuous interest rates, which is to say, the limit of the Compound Interest Rate. The term “Derivative” can be very naturally explained by the limits of functions. The first - and higher derivative of function allow one to solve problems with searches for the maximum or minimum of a function; the so-called Extremal Problems. The solution of these problems makes it possible to optimize many processes from the engineering practice field.

The second example deals with the application of the derivation of a certain function to solve the extremal problem of the maximum profit calculation.

In the third example, the necessary condition of the local extreme of a certain function is applied to minimize the cost of building a road connection to a railway line so that the connection is directed under the optimum angle. In the fourth example, a Cosine Theorem - known from secondary school geometry lessons is applied, and the necessary condition of the local extreme of the function of one variable is used to calculate the optimal distance such that the observer is able to register/see the vertical image at the maximum angle. This is a situation that can be solved in security situations - where the observer is an explorer. The example is also interesting in that it also demonstrates in the figure showing a graph of certain functions, the relationship of the Arithmetic and Geometric Means of two values.

The fifth - and final example, is the application of the “Per Partes” method in an Indefinite Integral to derive the function of the total income, and hence - to determine the Demand Function; which, when applied to the limit at the plus infinity (improper) point $+\infty$, thus easily enables one to confirm the fact that the demand rapidly decreases with the quantity of products sold. This example is useful for teaching for many reasons. Especially because the “Per Partes” method is uncomplicated and is often discussed in the last years of secondary schools. Mathematicians know that this method very often also solves very complicated problems; for example from applications where mathematical physics equations are present - for which, advanced functional analysis procedures are needed.

In this example, there are functions that also contain Exponential Function. And it is up to the student’s ability to control the derivation and integration operations of such functions at universities where great emphasis on such matters. The reason is that the exponential course, or a course that is very close to it, has a large number of natural and social laws. At the end of the example, the notion of limits is used to demonstrate that - as noted above, demand decreases in dependence with respect to the growing quantity of the products sold. This conclusion of the example is a nice interconnection of Integral Calculus with the Limit, as the basic concept of the differential calculus of functions of one variable.

Note that in this article - as well as in the teaching process, we consistently use a valid international standard for writing mathematical symbols - (International Standard ISO 80000-2: 2009). In the Czech Republic, this is the national standard - (Czech Standard ISO 80000-2: 2012).

Findings–Main Results–Sample Solved Motivational Single Variable Calculus Examples

Example

The *Limit Process* application, and the use of the well-known definition of the *Euler Number* as the limit for the derivation of *Continuous Interest* - as the limit of the *Compound Interest Rate*

Derive the formula for *Compound Interest rates*, which are mainly used in theoretical financial models; you know that the extreme case (limit) of the Compound Interest rate described - including its formula in another case, where the *interest rate frequency* indicates how many times the interest is credited to a year, grows unboundedly; in other words, an unlimited short *interest rate period* also corresponds to the unlimitedly low *interest rate*. Abstract this from the *Withheld Interest Tax*.

Solution

Compound interests, when ignoring the withholding interest tax, is described by the formula

$$K_n = K_0 \cdot \left(1 + \frac{i}{m}\right)^n,$$

in which K_n is the amount payable, K_0 is the principal, i is the rate p. a., and n is the capital deposit period in years.

Now let us move on to the compound interest rate limit for $m \rightarrow +\infty$. For a period of n years, the interest is credited a number of times $m \cdot n$, in other words - the number of *interest periods* is now $m \cdot n$, since - in each of the n periods, there is another m period; i.e. the *limit process* leads to a formula describing *continuous interest*

$$K_n = \lim_{m \rightarrow +\infty} K_0 \cdot \left(1 + \frac{i}{m}\right)^{m \cdot n} = K_0 \cdot \lim_{m \rightarrow +\infty} \left[\left(1 + \frac{1}{\frac{m}{i}}\right)^{\frac{m}{i}} \right]^{i \cdot n} = K_0 \cdot \left[\lim_{\frac{m}{i} \rightarrow +\infty} \left(1 + \frac{1}{\frac{m}{i}}\right)^{\frac{m}{i}} \right]^{i \cdot n},$$

$$K_n = K_0 \cdot e^{i \cdot n},$$

where we use the defining equality for e

$$e := \lim_{x \rightarrow +\infty} \left(1 + \frac{1}{x}\right)^x.$$

In conclusion, let us note that the continuous interest rate is even more advantageous for depositors than compound interest is; whose special case is - that even though the strength of continuous interest is only manifested by interest rates of several tens of percent per year.

Example 2

The application of the *Derivative of Function Concept* to the solution of *Extremal Problems* relating to the *Maximum Profit Calculation*

A car rental centre has 50 passenger cars. Long-term observation has discovered that, in the course of the daily rental of one car for 30 €, it achieves full daily rental and every increase of rent of 1.5 € causes a decrement of interest in one car. Evaluate the car hire price, such that the firm's profit is maximised, if the new calculated price of car hire service is 3.- € per car on the daily overhead costs.

Solution

When x indicates the number of rented cars, then $50 - x$ cars remain untapped daily, as a result of increased rent by $1.5 \cdot (50 - x)$. Then, the daily rental income is equal to

$$P(x) = (30 + 1.5 \cdot (50 - x)) \cdot x - 3x = 102x - 1.5x^2. \quad (1)$$

The quadratic function $P(x)$, represented here by the parabola open against the (positive) direction of the axis Oy , has only one local, (and global), maximum at the critical point x_0 ; for which it is valid:

$$P'(x_0) = 102 - 3x_0 = 0 \Rightarrow x_0 = 34.$$

The increased rent of $1.5 \cdot (50 - 34) = 24.-$ €; that is, 54.- € per car; which gives a maximum daily profit of $P(34) = 1\,734.-$ €. from the daily rental of 34 cars.

In conclusion, let us note that the calculated value of 1 734 can also be obtained from (1), after modifying the quadratic expression to its "square" - (second power), known from secondary school mathematics. Then, it is valid that:

$$P(x) = -\frac{3}{2} \cdot x^2 + 102 \cdot x =$$

$$\begin{aligned}
 &= -\frac{3}{2} \left[x^2 - 2 \cdot \left(\frac{102}{3} \right) \cdot x + \left(\frac{102}{3} \right)^2 - \left(\frac{102}{3} \right)^2 \right] = \\
 &= -\frac{3}{2} \left(x - \frac{102}{3} \right)^2 - \frac{3}{2} \left(\frac{102}{3} \right)^2 \\
 P(x) &= -\frac{3}{2} \cdot (x - 34)^2 + 1734,
 \end{aligned}$$

so the parabola has its peak at the point $V = (34, 1734)$.

Example 3

The application of angular properties in adjacent triangles, expressed by goniometric functions and cyclometric functions, including the application of the *Local Minimum Necessary Condition* of the function of one variable to calculate the mathematical condition that guarantees the *Minimum economic Costs* necessary to make a direct road-connection to the railway line that runs from the city - which rail does not pass through, at an *Optimum Angle*; if the ratio of road transport costs to the cost of rail is known.

Not far from Company A, the railway should run along a straight line to B. At what angle α to the railway line is it necessary to design a straight road from A, to make transport from A to B as low as possible, if the long-term rate for road transport is 1t/km, as compared to rail m more times expensive?

Solution

The situation is described by the following figure

Figure 1 Finding the optimal angle of the road link to the railway line

Let n be the cost of transport by rail, p total cost, while v, l are constants. Then, it is valid that

$$\frac{v}{x} = \sin \alpha \Rightarrow x = \frac{v}{\sin \alpha}, y = l - d = l - v \cot \alpha,$$

so

$$p = m n x + n \cdot (l - d) = m n v \cdot \frac{1}{\sin \alpha} + n \cdot (l - v \cot \alpha).$$

The *Necessary* condition for the local *Extremum* of function $p(\alpha)$ gives

$$p'(\alpha) = -m n v \cdot \frac{\cos \alpha}{\sin^2 \alpha} + n \cdot (-v) \cdot \left(-\frac{1}{\sin^2 \alpha} \right) = 0 \Rightarrow -m n v \cdot \cos \alpha + n v = 0 \Rightarrow$$

where

$$\cos \alpha = \frac{1}{m}, \text{ kde } 1 < m. \quad (1)$$

From this, we obtain the *Stationary Point* of the function $p(\alpha)$, which is the sought angle

$$\alpha = \arccos \frac{1}{m}, \quad (2)$$

and that, under the following conditions

$$\cos \alpha = \frac{1}{m} < \cos \beta = \frac{l}{AB}$$

that is to say, under these conditions

$$\frac{l}{AB} < \frac{1}{m}, \quad (3)$$

Where l is the size of the perpendicular projection of the connecting road AB between Cities A and B in the direction of the railway line passing through City B.

It can be shown that $p''(\alpha) > 0$, i.e. the **total cost** $p(\alpha)$ is a function everywhere where $(0 < \alpha < \frac{\pi}{2})$ is **convex** and **minimal** for $\cos \alpha = \frac{1}{m}$..

Namely

$$p''(\alpha) = -mnv \cdot \frac{-\sin^3 \alpha - 2 \cos^2 \alpha \cdot \sin \alpha}{\sin^4 \alpha} - 2nv \cdot \sin^{-3} \alpha.$$

If we insert input from relation (1) here, we get - after a simple modification, the following relations

$$p''(\alpha(m)) = nv \cdot \frac{m^3}{\sqrt{m^2 - 1}} > 0.$$

Example 4

The application of the *Cosine Theorem* and the *Necessary* conditions for the existence of the *Local Extreme* function of one variable on the calculation of the *Optimal Distance* in which the robot is to be stopped in order to scan the height of the image of the vertical wall, under the greatest angle.

Determine the distance that the robot has to stop in order to scan the height of the image on the vertical wall at a maximum angle; if the upper, respectively, the lower edge of the image is by the value of a – or respectively, the value of b is higher than the robot's optical sensor.

Solution

The situation is illustrated in the following figure

Figure 2 Investigation of the maximum scanning angle of a vertical figure, depending on the distance of the figure

From the Cosine Theorem for a triangle with sides a, b, c - known from secondary school mathematics,

$$c^2 = a^2 + b^2 - 2ab \cdot \cos \gamma$$

we get

$$(a - b)^2 = (d^2 + a^2) + (d^2 + b^2) - 2\sqrt{(d^2 + a^2) \cdot (d^2 + b^2)} \cdot \cos \varphi.$$

Let us denote

$$y(d) = \cos \varphi = \frac{d^2 + ab}{\sqrt{(d^2 + a^2) \cdot (d^2 + b^2)}},$$

where this dependence is expressed in the following figure (obtained from the Matlab computer algebra system).

Figure 3 The graph of the dependence of scanned angle size, (given by the cosine function), with respect to the scan distance at $a = 8$, $b = 2$

From the geometrical essence of the task, it is obvious that the angle attains its maximum - and this is only once. Therefore, it is sufficient to use the necessary condition for its existence; which is the zero value of the derivative of the following function:

$$y'(d) = \frac{2d\sqrt{(d^2 + a^2) \cdot (d^2 + b^2)} - (d^2 + ab) \cdot \frac{d(2d^2 + a^2 + b^2)}{\sqrt{(d^2 + a^2) \cdot (d^2 + b^2)}}}{(d^2 + a^2) \cdot (d^2 + b^2)} =$$

$$= \frac{2d(d^2 + a^2) \cdot (d^2 + b^2) - (d^2 + ab) \cdot d(2d^2 + a^2 + b^2)}{[(d^2 + a^2) \cdot (d^2 + b^2)]^{\frac{3}{2}}} = 0.$$

Therefore, after the rearrangement of the last fraction numerator, the following equalities must hold for the nullity of that numerator.

$$\underbrace{(a - b)^2}_{> 0} \cdot (d^2 - ab) = 0 \Rightarrow d = \sqrt{a \cdot b}.$$

Conclusion

The robot must stop at a distance that is equal to the geometric mean (centre) of the two values a and b ; and it can be deduced that the corresponding value in this distance $y = \cos \varphi$, is given by the ratio of the geometric mean $\sqrt{a \cdot b}$ to the arithmetic mean $(a + b)/2$.

Example 5

The application of the “Per Partes” method in an Indefinite integral in order to derive the function of the Total Income - and from it, to then deduce the Demand function, from which it can be confirmed by the application of the Limit at the plus infinity (improper) point, that demand rapidly decreases with the quantity of products sold.

Find the function of Total Revenue $T_R(x)$ and Demand Function $d(x)$, if the Marginal Income function is $M_R(x)$; where x is the number of products, is given by the relation:

$$M_R(x) = \left(2 - \frac{x}{50}\right) e^{-\frac{x}{4}}.$$

Solution

The Total Revenue function holds

$$T_R(x) = \int M_R(x) dx.$$

After insertion, we will get

$$T_R(x) = \int \left(2 - \frac{x}{50}\right) e^{-\frac{x}{4}} dx = \left(2 - \frac{x}{50}\right) \cdot (-4) \cdot e^{-\frac{x}{4}} - \int \left(-\frac{1}{50}\right) \cdot (-4) \cdot e^{-\frac{x}{4}} dx =$$

$$= -8 \cdot e^{-\frac{x}{4}} + \frac{4x}{50} \cdot e^{-\frac{x}{4}} - \left(-\frac{16}{50} \cdot e^{-\frac{x}{4}} + C\right) =$$

$$= \frac{2}{25} \cdot (x - 96) \cdot e^{-\frac{x}{4}} + C.$$

Thus, the Total Income function is

$$T_R(x) = \frac{2}{25} \cdot (x - 96) \cdot e^{-\frac{x}{4}} + C \quad (1)$$

In the calculation, we used the “Per Parties” method that we had chosen

$$\begin{aligned} u &= 2 - \frac{x}{50} & v' &= e^{-\frac{x}{4}} \\ u' &= \left(0 - \frac{1}{50}\right) & v &= (-4) \cdot e^{-\frac{x}{4}} \end{aligned}$$

We calculate the Integration Constant from Equation (1), in which we replace x by zero - (the zero quantity of products for which we received zero income). The so-called **Initial Condition** for a unique solution then gives:

$$T_R(0) = -\frac{192}{25} + C = 0 \Rightarrow C = \frac{192}{25}$$

The Total Revenue function is

$$T_R(x) = \frac{2}{25} \cdot (x - 96) \cdot e^{-\frac{x}{4}} + \frac{192}{25} \quad (2)$$

We determine the Demand Function $d(x)$ from the relation

$$T_R(x) = x p = x d(x), \quad p - \text{price of product.}$$

From here, we have - for the Demand Function $d(x)$

$$d(x) = \frac{T_R(x)}{x} \quad (3)$$

After substitution of (2) into (3), we derive the demand function $d(x)$ relation

$$d(x) = \frac{1}{x} \cdot \left[\frac{2}{25} \cdot (x - 96) \cdot e^{-\frac{x}{4}} + \frac{192}{25} \right],$$

so

$$d(x) = \frac{2}{25} \cdot \left(1 - \frac{96}{x}\right) \cdot \frac{1}{e^{\frac{x}{4}}} + \frac{192}{25x}.$$

From this, it is obvious here that Demand $d(x)$ decreases rapidly with the number of (sold) products; since

$$\lim_{x \rightarrow +\infty} d(x) = 0.$$

Conclusions

The aim of the article was, apart from the attempt to find answers to some more general questions relating to motivating students to study Mathematics; to show –at the same time, a sample of appropriate uncomplicated examples from the Single Variable Calculus field. The sample of five examples presented herein is primarily intended for students of the first year of the Security and Economics disciplines. Both of these disciplines are studied at Tomas Bata University in Zlín, but the authors believe that these examples can also be used at other universities where Single Variable Calculus is taught; whether in the full-time or combined/distance forms of studies. Of course, these examples can also be used in the appropriate parts of the secondary schools as well. Interest in the study of mathematics can be significantly buttressed the use of effective motivational strategies - these strategies are studied in detail by Posamentier and Krulik, (2011).

The results presented in this paper link to the duly defended Research Project No. 504 of the Ministry of Education, Youth and Sports of the Czech Republic, and the experience gained in writing textbooks, like – for instance - (Fialka, 2008a; Fialka 2008b; Fialka 2008c).

In conclusion, let's recall the well-known pedagogical principle that says that, “better is an example, than mere words”, as follows:

“Verba movent, exempla trahunt”... “Words encourage, examples compel.”

Abstract

Formative assessment is based on the principle of determining students' learning needs and teaching them with their needs in mind. The main goal of formative feedback is to strengthen students' knowledge, specific skills, understanding in certain contents, and general skills such as problem solving. The aim of this study is to determine pre-service preschool teachers' opinions about the use of formative assessment. This is a case study, a qualitative research method. This study was conducted with 63 pre-service teachers who were juniors in the education faculty of a public university in the west of Turkey's Black Sea Region in the 2016-2017 academic year. The study data were collected using an opinion form which included open-ended questions as well as interview questions. Pre-service teachers' written explanations to the open-ended questions were analyzed using content analysis, a qualitative analysis method. In addition, the study used descriptive analysis to assess the data that were collected during interviews with the purpose of obtaining further information. The research results show that a majority of pre service teachers' had positive opinions about formative assessment. They stated that formative assessment has many advantages such as enhancing efficiency, providing experience and self-evaluation.

Keywords: *Formative assessment, teacher training, preservice teachers.*

Introduction

Education aims to train individuals in a form ideally suited to meet the needs of the time. All of the works corresponding to this aim serve to constitute a qualified education. One of the most important elements governing the capacity to improve the quality of education is the "evaluation" stage, which acts as a control mechanism (Taras, 2002, 2003), as it serves to identify the extent to which the aims are achieved and the success of the elements (student, teacher, teaching method, teaching materials etc.) constituting the learning process. There are two types of assessment, product assessment, which is an assessment conducted at the end of units to determine what the students have learned, and formative assessment, which is an assessment conducted to determine the learning needs of the students (OECD, 2005; Liu & Carless, 2006). Recent results have shown that the product assessment methods, which are commonly used in schools and require the students to achieve predetermined standards in order to earn a diploma, are insufficient (OECD/CERI, 2008). Formative assessment methods, whose function is focused on preventing students from failing to continue their education in the future, serve as an alternative to the product assessment methods. Formative assessment is based on the principle that the needs of the students are determined in the process and that teaching is modified according to those needs. According to Shute (2007), the main objective of formative assessment is to increase the students' knowledge and skills, like drawing inferences or problem-solving in certain content areas. In this sense, the quality of learning can be increased through formative assessment (Higgins, Hartley, & Skelton, 2002). Gagne (cited in: Gibbs & Simpson, 2004) lists the effects of formative assessment in a learning environment as follows: activating and reinforcing background information and learning, ensuring that mainly active learning strategies are used, and enabling opportunities for the students to reinforce and implement their skills before introducing new information and materials to them. In addition to these, the following could be included: providing students with information and corrective feedback on the learning outcome, ensuring that the students are aware of their learning, and helping them develop self-evaluation skills, all of which will serve to give students the opportunity to experience the feeling of success.

Rubrics are one of the most important tools used in formative assessment. They are applied in the assessment process to identify the learners' knowledge and skills, study habits, efforts, and values according to predetermined criteria (Kan, 2007). In many studies conducted on the use of rubrics in the learning environments, it has been stated that the use of rubrics improves the quality of learning (Andrade, 2005; Andrade & Du, 2005; Panadero, Alonso-Tapia, & Huertas, 2012; Panadero, Alonso-Tapia & Reche, 2013; Reddy & Andrade, 2010). In a study by Panadero and Jonsson (2013), rubrics were found to be capable of positively affecting the learning of the learners. Additionally, Wollenschlager, Hattie, Machts, Moller and Harms (2016) found in their study that rubrics had a positive effect on performance. Teachers too have found rubrics to be quite useful (Kutlu, Bilican, & Yıldırım 2010).

A high-quality, up-to-date education requires practices that improve both skills and knowledge. Studies that seek

to understand how individuals internalize and use information in line with their aims and how they provide effective solutions to problems have therefore gained importance in the respective literature. Moreover, as it relates to pedagogy, taking applied classes during undergraduate education is of major importance. The acquisition of knowledge and skills that pre-service teachers can achieve by taking responsibility for their learning and doing self-evaluations plays a key role in improving their future teaching abilities. In the applied classes taken during undergraduate education, the quality and accuracy of the application are particularly important. In applications involving formative assessment, theory and practice are able to be bridged and self-evaluations are made possible through accurate performances. By offering applied classes during undergraduate education, there would be an improvement in the quality of the practices applied by pre-service teachers and they would be able to accurately employ the formative assessments, as they will have gained experience in how it is used and been given the opportunity to test its effectiveness. It is believed that the results of this study shall contribute to improving the quality standards in teacher training.

Purpose Of The Study

The purpose of this study is to investigate the views held by pre-service preschool teachers on the formative assessment process. This study was performed within the "Creativity and Its Improvement" class offered to second-year students under the Preschool Teacher Education Department. The participants' opinions on the use of formative assessment (rubrics, and verbal-written feedbacks), which they had learned about during the process of applying creative thinking techniques in actual classroom environments, were canvassed.

The following research questions were developed for the study:

1. What are the views of pre-service teachers regarding the advantages of formative assessment?
2. What are the views of pre-service teachers regarding the disadvantages of formative assessment?
3. What are the views of pre-service teachers regarding the use of rubrics in formative assessment?
 - a) What are the views of pre-service teachers regarding planning rubric?
 - b) What are the views of pre-service teachers regarding application rubric?
 - c) What are the views of pre-service teachers regarding finalization rubric?
4. What are the views of pre-service teachers regarding whether formative assessment contributes to professional development or not?

What are the views of pre-service teachers regarding the use of formative assessment in other courses?

Methodology

Study Design

This study adopted a qualitative case study design. The most important characteristic of a qualitative case study is its ability to perform an in-depth investigation of one or several cases (Yıldırım & Şimşek, 2008). Additionally, according to Büyüköztürk, Çakmak, Akgün, Karadeniz, and Demirel (2012), case studies are a type of study in which a phenomenon is described in a single space and time. In case studies, the researcher(s) is/are responsible for qualifying the case to be examined, and the cases are not restricted to only certain persons and objects that have a specific identity (such as a group, a person, a class, or an institution) but can also be an incident, an activity, or a process (Johnson & Christensen, 2014). The case investigated in this study is the evaluation process of pre-service teachers' practices in actual classroom environments using formative assessment.

Participants

A total of 63 second-year pre-service preschool teachers, who were studying at the Ereğli Faculty of Education of Zonguldak Bülent Ecevit University in the 2016-2017 academic year, participated in the study. The participants were between the ages of 19 and 21, and 60 were female and 3 were male. All of the participants were taking the "Creativity and Its Improvement" class for the first time.

Procedure

Within the scope of the "Creativity and Its Improvement" class, the participants were presented the general concepts of brainstorming, creative drama, analogy, and case study techniques, and model practices were demonstrated. After being provided the theoretical knowledge on these concepts, the participants were asked to conduct group work on one of these techniques and to plan an "application". Next, three rubrics (planning, application, and finalization rubrics) were given. The rubrics and the criterion governing them were explained, and it was made clear that the evaluation of the works would be conducted according to these rubrics. The pre-service teachers performed the implementation in the following three stages:

1st Stage: In the planning of the application process, the pre-service teachers plotted the procedure by considering the criterion in the "planning rubric". Each of the pre-service teachers presented their planned applications during their practice and in their classes (at the university). After the presentations, they were given verbal feedback by the instructor regarding the application plan of the techniques and the suitability of the techniques in terms of grade

level and creativity. A sample criterion for the planning rubric used by the pre-service teachers is given in Table 1.

Table 1: Sample Criterion for Planning Rubric

CRITERION	ACHIEVEMENT LEVELS		
	<u>5 points</u>	<u>10 points</u>	<u>20 points</u>
The nature of the technique	The technique is not planned properly	The technique planned partially conforms to the rules	The technique is planned properly

2nd Stage: The pre-service teachers started the implementation phase of their works which had been planned after receiving feedback. At this stage, the participants used an “application rubric”, and they implemented the subjects that they had selected by considering the criterion of the rubric in the classroom environment. The criterion in the application rubric covers the points that need to be paid attention to and taken into consideration during the implementation of the creative thinking techniques in the classroom environment. The techniques that the pre-service teachers were provided training on and given feedback for were implemented in 2-hour sessions in a preschool classroom (authentic classroom environment) with 5-6-year-old children. Each technique was implemented in a different school with different contents. A sample criterion for the application rubric is given in Table 2.

Table 2: Sample Criterion for Application Rubric

CRITERION	ACHIEVEMENT LEVELS		
	<u>2 points</u>	<u>5 points</u>	<u>10 points</u>
Imagination	None of the students used their imagination during the application.	Only a few students used their imagination during the implementation.	Many students used their imagination during the implementation.

3rd Stage: At this stage, the groups finished their application, prepared a PowerPoint presentation, which they presented to their instructors and classmates in the classroom environment (at the university), and prepared a report for their study. At this stage, the pre-service teachers used the finalization rubric. A sample criterion for the finalization rubric is given in Table 3.

Table 3: Sample Criterion for Finalization Rubric

CRITERION	ACHIEVEMENT LEVELS		
	<u>5 points</u>	<u>10 points</u>	<u>20 points</u>
Relating the collected data	The relations between the collected data are not shown and only seldom are inferences drawn from the application.	The collected data are only related to the rubric, making the inferences only partly sufficient.	Since the collected data are related based on the data received from multiple sources, the inferences drawn are quite sufficient.

Data Collection Tools

In this study, the data were collected from pre-service teachers through an open-ended questionnaire. This open-ended questionnaire was prepared in line with the research questions by the researcher. To confirm the content validity of the form and the interview questions, they were reviewed by two field experts and one assessment expert. When the actual classroom applications were completed, the form was administered to all of the participants, who filled it out individually. It took approximately 35 minutes for the participants to complete the form.

A sample question from the open-ended questionnaire:

What do you think are the advantages of formative assessment?

Interviews were used as another data collection tool for this study. The interview questions were prepared in line with the research questions. The interviews were conducted face-to-face with eight of the pre-service teachers from among the participants in order to investigate the research questions in-depth.

A sample question from the interviews:

Would you prefer the use of formative assessment in your other classes as well? Please explain your answer with reasons.

Data Analysis

The participants' answers to the open-ended questionnaire were analyzed using qualitative analysis techniques. The data obtained from the interviews were analyzed through descriptive analysis and investigated in line with the categories of the study, which were as follows: the advantages of formative assessment, the disadvantages of formative assessment, the use of rubric in formative assessment and the views on rubrics (planning rubric, application rubric, finalization rubric), contributions of formative assessment to professional development, and the use of formative assessment in other classes. The data were analyzed through content analysis, with two different raters analyzing the data, whose Miles-Huberman (Miles and Huberman, 1994) reliability value was found to be 93.67.

Findings

In this section, the findings from the study are presented in categories arranged in tables. Direct quotations from the views of the pre-service teachers were included as well.

The codes related to the "Advantages of Formative Assessment" category are given in Table 4.

Table 4: The Codes and Frequencies of the Advantages of Formative Assessment

Code	Frequency	Code	Frequency
Experience	35	Effective learning	5
Opportunity to perform application in the classroom environment	21	Motivation	5
Permanent learning	14	Guiding	4
Transferring theoretical knowledge into practice	12	Effective communication	3
Learning by doing	12	Awareness of the deficiencies of the class	3
Communication with students	9	Gaining experience by observation	3
Receiving feedback	7	Originality	3
Improving creativity	7	Knowing students	3
Mastery learning	7	An important activity	2
Individual evaluation	7	Critical thinking skill	2
First experience opportunity	6	Process evaluation	2
Awareness of different assessment techniques	6	Cooperation	2
Self-evaluation	6	Enjoyable	2
Gaining a different perspective	6	Socialization	1
Exchange of ideas	5		

According to Table 4, the pre-service teachers stated that among the advantages of formative assessment were that it provided experience and facilitated permanent learning by giving them the opportunity to practice in the classroom environment. Additionally, the participants thought that the application allowed them to transform theoretical knowledge into practical knowledge, contributed to learning by doing, and provided them the opportunity to communicate with the students. Pre-service teacher (PT -1) offered the following views on the advantages of formative assessment: *Formative assessment gives the pre-service teachers experience. It enables us to form our own ideas about our profession. Most importantly, it enables the person who thinks and feels that he/she should work as a teacher to definitively make that decision before the process is over.* Pre-service teacher (PT-6) added the following: *It enables active participation. Since each student has a role, the aim of the class is understood better. Any deficiencies in the studies are able to be identified during the presentation, and the views of other pre-service teachers are listened to and discussed. Group participation enables learning to take place together.* PT-2 offered the following views on communicating with students: *This is the first time that I have ever been to a kindergarten. I have practiced and spent time with children. This was a valuable opportunity for me to understand whether this profession is appropriate for me or not. I am quite happy; it was very important for me to participate in practicum and see the actual classroom environment.* It can be stated that the pre-service teachers gained professional development and experience in the use of assessment instruments.

The codes related to the “Disadvantages of Formative Assessment” category are given in Table 5.

Table 5: The Codes and Frequencies of the Disadvantages of Formative Assessment

Code	Frequency
No disadvantage	27
First-time application	7
Time-consuming	6
A difficult process	6
A stressful process	3
Unequal distribution of the responsibilities	3
Group work	3
Evaluation of the process	2
Insufficient experience regarding practice	2
Difficulty in controlling the process	2
Classroom management	1
The high number of evaluation criteria	1
Group evaluation during the process	1
Communication with students	1
The feeling of inadequacy in the process	1

According to Table 5, the majority of the pre-service teachers stated that formative assessment did not have any disadvantages. Some of the pre-service teachers cited their first time experience with the practice and the time-consuming and difficult nature of the process as disadvantages. Regarding this latter view, PT-5 stated the following: *This was my first practice and I hadn't worked at a preschool institution before, and I did not have any experience, therefore, I may not be able to demonstrate my full performance.* Similarly, PT-7 stated: *The application process was sometimes long and time-consuming.* During the process, group work was mentioned as a disadvantage, as expressed by PT-4, who stated: *Group work was definitely challenging. I could not fully implement what I thought because of the differences in opinions. There was no other disadvantage.* Although the formative assessment process is a time-consuming application, the majority of the pre-service teachers did not perceive this as a disadvantage.

The codes related to the “Use of Rubric in Formative Assessment” category are given in Table 6.

Table 6: The Codes and Frequencies of the Rubric Use in Formative Assessment

Code	Frequency
Guiding	26
Planning and organizing the process	13
Facilitates application and planning	6
Limits the process	5
Evaluates the process	5
Enables identification of the details	4
Enables identification of the deficiencies	4
Effective in the details of the process	3
Too detailed	3
Guide	3
Self-evaluation	3
Facilitating	2
Multidimensional thinking	2
Gaining points	2
Instruction	1
Making the process efficient	1
Guide	1
Objectivity	1

According to Table 6, the pre-service teachers thought that the rubrics used in formative assessment were guiding, that they helped in planning and organizing the process, and that they were necessary for limiting and evaluating the process. PT-1 had the following thoughts on the use of rubrics: *Rubrics made the process easier. We evaluated both ourselves and our process, so we became conscious and could think more critically.* Regarding the guiding feature of rubrics, PT-3 stated: *Having a rubric guided us in implementing the technique. Although we had learned the assessment in the class, the rubric helped us to understand why we did the assessment.* PT-5 added: *The use of the rubric is very important because it directs and enables awareness on the deficiencies. Additionally, we become aware of the points that we need to be careful about.* The positive views that the pre-service teachers had about rubrics and their characterization of them as guiding can be considered as the main reasons they adopted the formative assessment instrument and were willing to use it.

The codes related to the “Planning Rubric” category are given in Table 7.

Table 7: The Codes and Frequencies Regarding the Planning Rubric

Code	Frequency
Designing the process	14
Guiding	13
Organizing the process	11
Helps application	9
Showing the parts that need attention	9
Appropriate	6
Sufficient	5
Successful	4
Directive	3
Noticing the asking questions category	3
Beneficial	3
Necessary	3
Demonstrating the process step-by-step	3
Educational	3
Preparation for the application	2
Facilitating	2
Improving creativity	2
Detailed information	2
Self-confidence	1
A written framework of the process	1
Effective	1

According to Table 7, the pre-service teachers felt that since the planning rubric showed the points that needed attention, it helped them to perform the application and organize the process. Moreover, the pre-service teachers consider the rubric to be appropriate for the application, sufficient, and successful. PT-8 had the following thoughts on the planning rubric: *It acted as a blueprint to the questions of "How should I act?", "What should my application be like?", "What are my objectives?", and "How should I express them?", and it guided well.* PT-2 added: *It was important for us regarding the order of the plan and the points that need attention during the plan.* Finally, PT-3 stated: *When all was said and done, we had organization. In the absence of organization, discipline cannot be mentioned, and in the absence of discipline, success cannot be mentioned. We thought about what to do and what the questions should be.* From these opinions, it is clear that the planning rubric used in the formative assessment was guiding.

The codes related to the “Application Rubric” category are given in Table 8.

Table 8: The Codes and Frequencies Regarding Application Rubric

Code	Frequency
The inclusion of the practical aspect of the profession	13
Helpful in the classroom environment	12
The inclusion of the implementation stages	9
Planning the implementation process	8
Guides the application	7
Observing the students	7
Communication with students	7
Including the points that need attention in application	5
Changing according to the process	5
Successful	5
Fully sufficient	5
The most important part of the process	3
Appropriate	3
Note taking	2
The inclusion of the evaluation type	2
Beneficial	2
Has application aim	2
Effective	2
Improves creativity	2
School experience	2
Facilitating	1
Self-confidence	1
Internship	1

According to Table 8, the pre-service teachers stated that since the application rubric used in the formative assessment process includes application stages, it acted as a guide in the planning of the application process, and it provided an opportunity to observe and communicate with the students in the classroom environment. PT-5 expressed the following views regarding the application rubric: *It provided answers to my questions about how to do the application so that it enables use of the creative thinking technique. It helped us to make the right plan and act in the right way.* PT-6 added: *The application rubric provided an advantage by enabling the use of creative thinking skills and included the possible problems that may be faced during the application.* Finally, PT-1 stated: *Providing an application rubric is good; it provided information about how to do the application, which was nice, considering that I did not have previous experience.* The application rubric can be seen as a supplementary resource in the classroom environment, since it includes practical information on teaching.

The codes related to the “Finalization Rubric” category are given in Table 9.

Table 9: The Codes and Frequencies Regarding Finalization Rubric

Code	Frequency
Self-evaluation	10
Evaluation of the application process	10
Interpreting the results	7
Evaluating the activity	6
Appropriate	5
Seeing the objectives	5
Sharing the results	5
Evaluating the group	4
Awareness of the errors and deficiencies	4

Effective reporting of the results	2
Raising awareness on the possible problems	2
Planning the evaluation	2

Beneficial	2
Planning the presentation	2
Sufficient	2
Revision	2
Critical thinking	2
Creativity	1
Successful	1

According to Table 9, the participants felt that the finalization rubric was effective in the evaluation of the application process and interpretation of the results. Additionally, they thought that the rubric was appropriate for the process and effective since it included the objectives. PT-2 offered the following views on the finalization rubric: *At the end of the application part, everything was finalized. As a result, the better I do this part, the better I can reflect my homework.* Regarding self-evaluation, PT-4 stated: *It is quite an important step in terms of evaluating the activity. It helped us by enabling us to ask the following questions to ourselves: "What did we do?", "What did we expect?", and "How did it happen?".* Additionally, PT-7 stated: *The finalization rubric enabled me to see what I have done in the application and the objectives.* From these statements, it is clear that the finalization rubric used in the formative assessment process provided an opportunity for self-evaluation. The codes related to the "Contribution of the Formative Assessment to Professional Development" category are given in Table 10.

Table 10: The Codes and Frequencies Regarding Whether Formative Assessment Contributes to Professional Development

Code	Frequency	Code	Frequency
It contributed to professional development	23	Motivation	3
School experience	14	Developing original ideas	3
Preparation for the profession	13	Effective learning	3
Learning by doing	9	Enables permanence	2
Practicing in a real classroom environment	9	Seeing the results of methods and techniques	2
Transferring theoretical knowledge into practice	8	Making observation	2
Self-evaluation	8	Evaluation in the classroom environment	2
Evaluation	6	Beneficial	2
Communication with students	6	Classroom management	2
Awareness	6	Considering individual differences	1
First experience	5	Self-efficacy	1
First time communication with students	5	Reaching the objectives	1
Learning how to design a lesson procedure	5	Encouraging	1
Critical thinking	5		

According to Table 10, the participants felt that formative assessment contributed to professional development in terms of providing school experience, enabling the opportunity for practice in an actual classroom environment, transferring theoretical knowledge into practice, and enabling the opportunity of self-evaluation. On this issue, PT-8 stated: *It would be very pleasing to move from simple memorization to this system.* PT-3 added: *It certainly contributed to my professional development. Practicing with children in the real classroom environment moved the techniques outside the limits of formal information; it will enable us to conceptualize and conduct similar activities in the future.* Finally, PT-1 had the following to say on the subject: *This is the first time I have ever come across this type of assessment. I wish we had this assessment for each course. I wish that we could apply everything we learned so that the information would be more permanent.*

The codes related to the "Use of Formative Assessment in Other Course" category are given in Table 11.

Table 11: The Codes and Frequencies Regarding the Use of Formative Assessment in Other Courses

Category	Code	Frequency
Yes (41)	Turning theoretical knowledge into application	9
	Increasing permanence	8
	A beneficial application	7
	Learning by doing	6
	Applied system instead of memorization	5
	In applied classes	5
	In pedagogy classes	3
	Professional development	3
	Learning the subject comprehensively	3
	Communication with students	2
	Self-evaluation	2
	Cooperation	2
	Performance-based learning	2
	A different evaluation	2
	Facilitates learning	2
	Practice in the actual classroom environment	2
	Training experienced teachers	2
	Improving creativity	2
	Responsibility	1
	Developing ideas	1
	Embodying	1
	Practical courses	1
	Experience	1
No (4)	Not appropriate for each course	2
	Stressful process	1
	Time-consuming	1
In certain courses (13)	Permanence	3
	In field courses	2
	In applied classes	2
	Experience	1
	Educative	1
	Preparation for the profession	1
	Depends on the content of the course	1

According to Table 11, the majority of the participants felt that formative assessment should be used in other courses as well, particularly because it transforms theoretical knowledge into practice, increases permanence, is an educative application, and provides an opportunity to learn by doing rather than memorizing. Regarding its use in other courses, PT-2 said: *'Yes, I would definitely want it because it is an extraordinary evaluation method.* PT-6 stated: *'Yes, I would. I think its use, especially in the applied classes, will be beneficial for us.* Additionally, regarding its use in other written courses, PT-4 stated: *'Yes, I would want it. We won't teach by memorization, we will teach by doing. So, I think we need to learn by doing.'*

Conclusions, Discussion, And Implications

This study revealed that the views of the majority of the pre-service teachers regarding formative assessment were positive. Among these views, gaining experience, enabling permanence learning, and turning theoretical knowledge into practice stood out. Additionally, they felt that this application facilitated their professional development and provided them with a chance to communicate with the students in the classroom environment. The findings of other studies in the literature support the results of this study. Formative assessment is an application that includes various approaches capable of being used to support a student's learning (Van der Kleij, Vermeulen, Schildkamp, & Eggen, 2015; Briggs, Ruiz-Primo, Furtak, Shepard, & Yin, 2012). Decristan et al. (2015) conducted an experimental study on curriculum-embedded formative assessment and its effect on classroom quality and found that the curriculum-embedded formative assessment's impact on class quality for a science course taught on floating and sinking helped to facilitate the students learning. Bulunuz and Bulunuz (2013) noted in their study that the use of the formative assessment approach in science courses has high potential in terms of supporting conceptual learning. In a report by Jones (2005), it was stated that in order to progress in a specific activity it is necessary to provide feedback, which is an element of formative assessments, to the students. When the students are provided with feedback to improve the task that they are working on, the value they derive

from it is perceived as a motivator. Studies conducted in various fields of education have revealed that the formative assessment process needs to be actively employed in education.

Rubrics, which function as an element of formative assessment, was also addressed in this study. The pre-service teachers viewed the rubrics that they used in the process of formative assessment as guiding and directive. Additionally, they felt that the rubrics were beneficial and important insofar as they helped in planning and organizing the process. In terms of each specific rubric, the participants expressed that the planning rubric they used guided them by helping them to design and organize the process, that the application rubric helped to improve the practical aspect of the teaching profession and included the application steps for the classroom environment, and that the planning rubric facilitated their self-evaluation by interpreting the results and evaluating the process. Other studies in the literature that were conducted on the effectiveness of rubrics in the learning environments support the findings of this study. In education, rubrics are an effective tool for teacher training, scientific contents, and assessment processes (Alsina, Ayllón, Colomer, Fernández-Peña, Fullana, Pallisera, Perez-Burriel, & Serra, 2017; Harrison & Lee, 2011; Timmermann, Strickland, Johnson, & Payne, 2011; Ward & McCotter, 2004; Panadero & Jonsson, 2013).

The following implications were drawn from the findings of this study:

1. In faculties of education, formative assessment should be included as part of applied undergraduate courses. Additionally, even in theoretical courses, formative assessment can be used by including application as part of the course.
2. In-service teachers can be trained on formative assessment by means of in-service training.
3. Rubrics, which are one of the elements of formative assessment tools, can be implemented at every level of learning, from primary school to higher education. In this respect, different application types may be used for many courses.
4. In teacher training, formative assessment types can be tested on different sample groups with different applications and instruments.

Similar studies may be conducted in different teaching branches and with a higher number of participants.

zbahar.ozdogan@hotmail.com

Abstract

This quantitative study examines educational faculty preservice teachers' awareness about STEM in terms of different variables. Students from the departments of mathematics education, science education and computer and instructional technology at Afyon Kocatepe University were the participants. This is a survey study, which used the STEM Awareness Scale (SAS) developed by Buyruk and Korkmaz (2016) to collect the data. Some quantitative data analysis tests were applied on the data obtained. The results show that the preservice teachers had positive perspectives on STEM education.

Key words: *STEM, preservice teachers, awareness*

Introduction

STEM stands for science, technology, engineering and mathematics. The term was first used in 2001 by Dr. Judith Ramaley, the Education and Human Resources Director of the National Science Foundation (NSF) (Chute, 2009), making the NSF the first institution to use the term (NAE & NRC, 2009; Sanders, 2009). According to Morrison (2006), STEM is a new discipline based on the integration of science, technology, engineering and mathematics. Advancements in science and technology make it essential for individuals to acquire the skills to overcome real life problems, use their new knowledge in real life settings, think creatively, and use their knowledge at the appropriate time and place. For these reasons, STEM education is important today (Akgündüz, Ertepinar, Ger, Kaplan Sayı & Türk, 2015; Bybee, 2010).

STEM increases the quality of learning environments in education, makes teaching processes more effective, and gives students opportunities to integrate the disciplines of science, technology, engineering and mathematics. Science is the effort to understand the natural world (NRC, 1996). It examines the natural world and uses inquiry, invention, discovery and scientific methods in courses such as physics, biology, astronomy and geology from primary school to the university level (Dugger, 2010). Technology also uses discovery and scientific methods (Dugger, 2010). Technology changes the natural world based on the desires and needs of humankind (ITEA, 2000). It can be defined as the design, development and production of new materials using natural resources. Processes such as invention, innovation, practical problem solving and design are included in technology (Dugger, 2010). Engineering concerns finding solutions to the needs of humankind using mathematical and scientific knowledge obtained through practice and experience (ABET, 2007). Engineering involves problems that must be solved, understanding problems, asking relevant questions, setting up benchmarks for successful solutions and identifying limitations (Bybee, 2011). Mathematics is defined as the relationships among models, figures and numbers (AAAS, 1993). Mathematics serves as a real language for science, technology and engineering (Dugger, 2010).

STEM education involves activities that can foster students' interests and tendencies in science, technology, engineering and mathematics using the skills they should possess today (Baran, Canbazoglu Bilici & Mesutoğlu, 2015). STEM education is intended to transform theoretical knowledge into implementation, production and innovative discoveries. It enables students to consider their learning in science, technology, engineering and mathematics as parts of a whole. Many countries have incorporated STEM into their curricula. STEM education enables students to enlarge their physical, intellectual and cultural worlds and fosters their competence in critical thinking and problem solving (Çorlu & Aydın, 2016).

STEM education is an interdisciplinary approach to learning from primary school to graduate school. It offers students an interdisciplinary perspective on problems and some skills and knowledge using a holistic understanding of education (Şahin, Ayar & Adıgüzel, 2014). NSF launched activities to attract attention to the content of STEM education in the 1990s and many international studies have been conducted in this regard (Bracey & Brooks, 2013; Buxton, 2001; Cleaves, 2005; Nadelson, Seifert, Moll & Coat, 2012; Pinnell et al., 2013). However, the Turkish literature has focused on this issue only in the last few years (Baran, Bilici & Mesutoğlu, 2015; Çevik, 2015; Gencer, 2015; Şahin, Ayar & Adıgüzel, 2014; Yamak, Bulut & Dündar, 2014; Yıldırım &

* This study study was supported by Afyon Kocatepe University BAP, Project number: 18.Kariyer.73.

Altun, 2015). These studies have mostly investigated teachers' or preservice teachers' awareness about STEM, developed scales or adapted international scales into Turkish. For example, Karakaya, Ünal, Çimen, and Yılmaz (2018) investigated science teachers' awareness about the STEM approach in terms of some variables. They found significant differences by gender, professional experience, in-service training and educational level, but no significant difference by classroom size or type. Another study of teachers' perspectives on and awareness about STEM education found that science teachers know the STEM model better than teachers from other disciplines and use it more, that science and mathematics teachers consider their disciplines as an indispensable to the STEM model, but that they restrain themselves from applying the model (Özbilen, 2018). Rather than determining the general situation, studies of preservice teachers have mostly taken the form of scale adaptation.

There is a limited number of studies in the literature that examine preservice teachers' awareness about STEM in terms of various variables. Therefore, this study can contribute to the literature because it examines educational faculty preservice teachers' awareness about STEM in terms of different variables. It sought answers to these research questions:

1. What is the level of preservice teachers' awareness about STEM?
2. Is there a significant difference between the levels of preservice teachers' awareness about STEM by department?
3. Is there a significant difference between the levels of preservice teachers' awareness about STEM by gender?
4. Is there a significant difference between the levels of preservice teachers' awareness about STEM by grade level?

Method

The participants in this study were students in the departments of mathematics education, science education and computer and instructional technologies at the educational faculty of Afyon Kocatepe University. This quantitative study was designed as a survey. According to Karasar (2014), researchers should use survey study design if they intend to describe a case as it exists, whether it is an event, individual or object. The STEM Awareness Scale (SAS) developed by Buyruk and Korkmaz (2016) was used to collect data. The data were analyzed using IBM SPSS 18 software. The Kolmogorov-Smirnov test was done to analyze the normality of the data distribution and showed ($p < 0.05$) that the data did not have a normal distribution. Therefore, non-parametric tests were used. The Mann-Whitney U test was used to make a pairwise comparison, and the Kruskal-Wallis test was used to make multiple comparisons.

Findings

Table 1 shows the descriptive analysis of the preservice teachers' scores on the STEM Awareness Scale.

Table 1. Descriptive analysis of the STEM Awareness Scale scores

Department	Positive perspective			Negative perspective			Overall Scale		
	N	Mean	sd	N	Mean	sd	N	Mean	sd
Mathematics Education	115	3.99	.875	115	4.03	.683	115	4.01	.736
Science Education	113	3.78	1.07	113	3.53	1.21	113	3.70	.947
Computer and Instructional Technologies Education	87	3.81	.778	87	3.41	1.14	87	3.69	.707
TOTAL	315	3.87	.930	315	3.68	1.06	315	3.81	.821

Table 1 shows that the mean scores on the positive perspective sub-dimension ($\bar{X} = 3.87$), on the negative perspective sub-dimension ($\bar{X} = 3.68$) and on the overall scale indicated that all of the preservice teachers had positive perceptions about STEM education ($\bar{X} = 3.81$).

Table 2 shows the mean scores on the scale by department.

Table 2. Kruskal-Wallis test results for the comparison of the mean scores on the STEM Awareness Scale

Scale	Group	N	Mean Rank	sd	Chi-Square	p	Significant Difference
Positive	Math Edu.	115	163.96	2	2.013	.366	-
	Science Edu.	113	160.85				
	Comp. Edu.	87	146.43				
Negative	Math Edu.	115	182.96	2	14.964	.001	1-2 1-3
	Science Edu.	113	149.99				
	Comp. Edu.	87	135.41				
Total	Math Edu.	115	178.70	2	10.734	.005	1-2 1-3
	Science Edu.	113	152.72				
	Comp. Edu.	87	137.51				

Table 2 shows that, even though no significant was found in the positive perspective sub-dimension, the mathematics education preservice teachers had a higher mean score (163.96) than the science education and computer education and instructional technologies preservice teachers.

The variance of the preservice primary mathematics teachers' mean scores by gender is shown in Table 3.

Table 3. Mann-Whitney U test results for the comparison of the preservice primary mathematics teachers' mean scores by gender

Scale	Group	N	Mean Score	Rank Total	U	p
Positive	Female	78	64.26	5012.00	955.000	.003*
	Male	37	44.81	1658.00		
Negative	Female	78	62.06	4841.00	1126.000	.056
	Male	37	49.43	1829.00		
Total	Female	78	64.06	4996.50	970.500	.005*
	Male	37	45.23	1673.50		

Table 3 shows that the female preservice teachers had significantly more positive perceptions of STEM in the positive perspective sub-dimension and the overall scale. However, no significant difference was found by gender in the negative perspectives sub-dimension.

Table 4 shows the mean scores of the primary mathematics education preservice teachers by grade level.

Table 4. Kruskal-Wallis test results for the comparison of the preservice primary mathematics teachers' mean scores by grade level

Scale	Groups	N	Mean Score	sd	χ^2	p	Significant Difference
Positive perspective	1 st year	30	43.13	3	8.33	.040	1-2
	2 nd year	30	62.48				1-3
	3 rd year	30	65.50				1-4
	4 th year	25	61.46				
Negative perspective	1 st year	30	51.37	3	2.46	.483	-
	2 nd year	30	62.98				
	3 rd year	30	61.88				
	4 th year	25	55.32				
Total	1 st year	30	43.92	3	8.04	.045	1-2
	2 nd year	30	64.20				1-3
	3 rd year	30	65.75				
	4 th year	25	58.16				

Table 4 shows that the sophomore, junior and senior preservice teachers in the primary mathematics education department had significantly more positive perspectives on STEM in the positive perspective sub-dimension than the freshmen. Although no significant difference was observed in the negative perspective sub-dimension, the sophomore, junior and senior preservice teachers had more positive perspectives in the negative perspectives sub-dimension than the freshmen.

Table 5 shows the preservice science teachers' mean scores by gender.

Table 5. Mann-Whitney U test results for the comparison of the preservice science teachers' mean scores by gender

Scale	Group	N	Mean Score	Rank Total	U	p
Positive	Female	93	59.97	5577.00	654.00	.037*
	Male	20	43.20	864.00		
Negative	Female	93	59.85	5566.00	665.00	.045*
	Male	20	43.75	875.00		
Total	Female	93	60.45	5622.00	609.00	.016*
	Male	20	40.95	819.00		

Table 5 shows that the female preservice teachers had significantly more positive perceptions of STEM in the sub-dimensions and the overall scale.

Table 6 shows the mean scores of science education preservice teachers by grade level.

Table 6: Kruskal Wallis test results for the comparison of the preservice science teachers' mean scores by grade level

Scale	Groups	N	Mean Score	sd	χ^2	p	Significant Difference
Positive	1 st year	27	39.65	3	11.543	.009*	1-2
	2 nd year	32	68.13				1-3
	3 rd year	26	59.69				1-4
	4 th year	28	58.52				
Negative	1 st year	27	46.07	3	14.276	.003*	1-2
	2 nd year	32	73.19				2-4
	3 rd year	26	60.19				
	4 th year	28	46.07				
Total	1 st year	27	39.67	3	15.994	.001*	1-2
	2 nd year	32	73.19				1-3
	3 rd year	26	59.56				2-4
	4 th year	28	52.84				

Table 6 shows that compared to the freshmen, the sophomore, junior and senior preservice teachers in the science education department had significantly more positive perspectives on STEM in the positive perspective sub-dimension. On the negative perspective sub-dimension of the scale, the sophomore preservice teachers had less negative perspectives on STEM than the freshmen and seniors. On the overall scale, the sophomore and junior preservice teachers had more positive perspectives on STEM than the freshmen, and the senior preservice teachers had more negative perspectives on STEM than the sophomores.

Table 7 shows the preservice computer and instructional technologies teachers' mean scores by gender.

Table 7: Mann-Whitney U test results for the comparison of the preservice computer and instructional technologies teachers' mean scores by gender

Scale	Group	N	Mean score	Rank total	U	p
Positive	Female	48	49.98	2399.00	649.000	.014*
	Male	39	36.64	1429.00		
Negative	Female	48	50.98	2447.00	601.000	.004*
	Male	39	35.41	1381.00		
Total	Female	48	51.47	2470.50	577.500	.002*
	Male	39	34.81	1357.50		

Table 7 shows that the female computer and instructional technologies preservice teachers had significantly more positive perspectives on STEM in the sub-dimensions of the scale and the overall scale.

Table 8 shows the mean scores of the computer and instructional technologies preservice teachers by grade level.

Table 8. Kruskal Wallis test results for the comparison of the preservice computer and instructional technologies teachers' mean scores by grade level

Scale	Groups	N	Mean Score	Sd	Chi-square	P	Significant Difference
positive perspective	2 nd year	30	37.10	2	9.893	.007	2-4
	3 rd year	30	39.57				
	4 th year	27	56.59				
Negative perspective	2 nd year	30	42.73	2	0.119	.942	3-4
	3 rd year	30	44.50				
	4 th year	27	44.85				
Total	2 nd year	30	38.78	2	4.868	.088	2-4
	3 rd year	30	41.33				
	4 th year	27	52.76				

Table 8 shows that, compared to the sophomores, the senior preservice teachers had significantly more positive perspectives on STEM education in the positive perspective sub-dimension of the scale and the overall scale. In the negative perspectives sub-dimension, the senior preservice teachers had less negative perspectives than the juniors.

Conclusions

The results indicate that the preservice teachers from the departments of mathematics, science, and computer and instructional technologies have positive perspectives towards STEM, which is corroborated by many studies of preservice teachers and STEM education (Akaygun & Aslan-Tutak, 2016; Yenilmez & Balbağ, 2016; Yıldırım & Selvi, 2015). This also underlines that preservice teachers had positive awareness about STEM. Studies have shown that individuals with high awareness about STEM also have more positive perceptions of and perspectives on it (Guzey, Harwell & Moore, 2014; Schmidt & Kelter, 2017).

The preservice teachers in the department of mathematics education had more positive perceptions of STEM. Yenilmez and Balbağ (2016) reported that preservice science teachers have more positive attitudes. This may stem from preservice teachers' learning backgrounds or the difference between their undergraduate courses.

The females' mean scores on the STEM Awareness Scale were higher than the males in all departments. This result is corroborated by those of Yenilmez and Balbağ (2016). Çevik, Danıştay and Yağcı (2017) investigated teachers' awareness about STEM by gender and found no significant difference by gender. Therefore, the effect of the gender variable on the awareness about STEM may differ in preservice or in-service training courses.

By grade level, the sophomore, junior and senior preservice teachers from the department of mathematics education had more positive perspectives on STEM than the freshmen. This may imply that courses in mathematics education positively influence their perceptions of STEM. The sophomore, junior and senior preservice science teachers had significantly higher mean scores on the positive perspective sub-dimension of the scale than the freshman. However, the senior preservice science teachers had less negative perceptions of STEM in the other sub-dimensions of the scale and the overall scale than the sophomores. The reasons for this can be investigated in further qualitative research. On the other hand, the senior preservice computer and instructional technologies education preservice teachers had more positive perceptions of STEM than the sophomores and juniors.

nily@aku.edu.tr

Abstract

The aim of the current research is to determine the STEM teaching intention of pre-service teachers and learn their views towards STEM and STEM implementations. Mixed method research was used in this study. For the quantitative part of the research, the data were collected through "Integrative STEM Teaching Intention Questionnaire" developed by Lin and Williams (2015) and the Turkish version of the questionnaire adapted by Hacıömeroğlu and Bulut (2016). The scale consist of 31 items, 7 likert type and five dimensions. In the qualitative part of the research semi-structured interview technique was used. One of the purposeful sampling methods', criterion sampling was used for the selection of the participants. The students of primary school teacher training program were chosen as the participants of the current research. After analyzing process, the results showed that pre-service teachers' STEM teaching intentions were high. The results of the qualitative part of the study were tally with the results of the quantitative part. According to the result of the qualitative of the current research, it was shown that the teacher candidates believed themselves using STEM in their classes and if they had problems they believed to solve them while implementation of STEM.

Keywords: *Pre-service teachers, STEM, STEM education, STEM teaching intentions,*

Introduction

The need for qualified people has caused the countries to go for a change in their education policies. "In the 21st century, developments in science, technology, engineering, and mathematics, in particular, have accelerated in all areas, but have almost influenced every aspect of modern life and play a key role in solving the most immediate and future problems of humanity" (National Research Council-NRC, 2012). For this reason, the present education systems aim efficient learning and teaching approaches in order to cope with economic races, ever-growing technologies, vast amounts of information and other concerns of the 21st century (Wells, 2008). STEM (Science, Technology, Engineering, and Mathematics) education which drew attention to this point during the last years is an approach that unifies science, technology, engineering and mathematics content, and skills during the teaching-learning process. The STEM is an integrated approach and aims the students to look at the problems with an inter-discipline point of view and to acquire knowledge and skill.

When we consider the fast advancement of science and technology, it is accepted by the majority that the students need to deal with real problems through a multi-discipline education program that merges theory and practice and to increase their creative skills in problem-solving. This situation brings forth the STEM education (Chang et. al, 2015). Since STEM has the potential in developing the capacity of innovation and competition power of nations originating from labor and industry branches, these disciplines are important. The request for STEM has increased in speed for the last ten years for sustainable economic growth and a brighter future (Langdon, Mckittrick, Beede, Han and Doms, 2011).

When the needs of the age we live in are considered, there is a need for individuals who can solve real-world problems in areas such as science, technology, mathematics, and engineering, not just with understanding the relationship between science and technology, but with interdisciplinary relations. The STEM is preferred as the strongest model to be used in this context. This is because STEM contributes to society in terms of leadership in technology and economy, success in science and mathematics, raising qualified individuals, developing sustainable economics, developing skills (scientific process, investigation, critical thinking, etc.), solving real-world problems and being productive, and increasing the number of individuals needed in the twenty-first century working environment (Toulmin and Groome, 2007).

An integrative viewpoint in STEM education can be thought of as the adaptation of the four fields as content, or as a context in which one is taken into focus and others are taught the content of this discipline. It can also be done in the form of combining at least two of these four areas, if not all of them. For example, to provide integration of mathematics, engineering, and technology in the context of science lessons (Dugger, 2010). However, the interpretation of STEM as science or mathematics and the lack of recollection of technology or engineering is a subject that needs to be solved (Bybee, 2010).

STEM education is an educational approach distinguished by interdisciplinary nature from pre-school education to university education (Gonzalez and Kuenzi, 2012). There are sufficient research results that show STEM

education has positive effects on students' achievement, interests, and motivations. This leads to the increased practice of the STEM approach and to be worked on more (Sanders, 2009).

The fact that countries that implement the STEM as an education system on an international platform have seen significant increases in the results of the global assessment examinations such as PISA and TIMSS have led other countries to focus their attention on the STEM and have focused their training reforms on an additional interest in STEM education. The PISA 2015 results showed that the performance of Turkish students was below the average of scientific literacy, mathematics literacy and reading skills (MEB, 2016a). The findings of TIMSS 2015 revealed that Turkish students did not have an excellent success in terms of science and mathematics performance (MEB, 2016b). OECD Education at a Glance when seen which countries will take the lead professions in the future STEM area according to the 2017 report, Turkey appears to be the last among 34 countries (OECD Education at a Glance, 2017). These results suggest that Turkey also needs to be done in a systematic education reform across the country and revealed the necessity of the increase in the STEM applications.

Because of these developments emerging in the field of education in Turkey, arrangements were made in 2017 for all curricula from elementary school to high school to be renewed. Primary school, mathematics, science, and technology-design teachers need to cooperatively develop investigation-based STEM teaching plans that support students' critical and creative thinking skills. So, the teachers and also the pre-service teachers have to learn STEM and how to implement STEM in their classes.

Teachers have a key role in implementing and spreading STEM education throughout the country. This is because the increase in employment of the countries in the areas of STEM depends on the quality of teachers who can give STEM education to the students at an early age (Wang, 2012). Teachers who will give STEM training should be educated in this field both as interservice and in before service (Çorlu, Capraro and Capraro, 2014). However, when compared with the developments in the world, it is not at the desired and expected level and it is pointed out that the universities should take measures in this regard urgently (Çolakoğlu and Gökben, 2017). The aim of the current research is to determine the STEM teaching intention of pre-service teachers and learn their views towards STEM and STEM implementations.

The Methodology Of The Study

Mixed method was used for current research. Different patterns can be used in mixed method researches. One of these patterns is convergent parallel design. Qualitative and quantitative stages occur simultaneously in the same phase of the research process. This pattern gives equal priority to the methods, separates the phases from each other during analysis, and then combines the results when doing general interpretation (Creswell and Plano Clark, 2015). While quantitative data are collected during the screening type surveys, data obtained through questionnaires or interviews are described by statistically analyzed analysis of the questions or hypotheses that are raised at the beginning of the study. The results of the statistical analysis are interpreted in relation to previous research findings (Creswell, 2012). In this context, STEM teaching intentions of participants were determined using the "Integrative STEM Teaching Intention Questionnaire" in the quantitative survey of this research. In the qualitative dimension of the study, the interview technique was used. Interviewing is a useful technique that is used when participants want to understand their point of view or to learn how participants understand the facts and events. It is possible to classify the interview technique as structured, semi-structured and unstructured interviews. When determining the type of interview to be used, the types of questions to be asked and the types of responses desired should be taken into consideration (Yıldırım and Şimşek, 2013, Berg and Lune, 2015). Qualitative aspects of this study were based on a semi-structured interview technique for taking the participants' views about STEM and STEM implementations.

One of the purposeful sampling methods', criterion sampling was used for the selection of the participants. The main criterion was to taken "Science teaching method course I" and "Mathematics teaching method course I" by pre-service teachers. According to this criterion, the students of primary school teacher training program of the education faculty of a state university were chosen as the participants of the current research.

For the quantitative part of the research, the data were collected through "Integrative STEM Teaching Intention Questionnaire" developed by Lin and Williams (2015) and the Turkish version of the questionnaire adapted by Hacıömeroğlu and Bulut (2016). The adapted questionnaire includes 31 items placed on a 7-point likert type scale. The questionnaire includes five sub-scales: knowledge ($\alpha=.93$), value ($\alpha=.86$), attitude ($\alpha=.87$), subjective norm ($\alpha=.69$), perceived behavioral control and behavioral intention ($\alpha=.86$). Cronbach's alpha coefficient for the overall instrument was calculated as .94.

In the qualitative part of the research, the data were collected through semi-structured interview form. The interview form was developed by researcher then given to two experts to provide internal validity of the interview form, and the form took its final shape by being reviewed. After a student engaged in the pilot interview the sound recording was transcribed. The interview printout form was computerised in order to determine whether or not the questions were clear and comprehensible and the answers of the student reflected the answers of the questions. At the end of this study, the validity of the questions was determined. The data were analyzed using descriptive statistics for quantitative part. The content analysis technique was used to analyze the qualitative data.

Findings

The quantitative part of the study examined pre-service teachers' STEM teaching intentions with descriptive analysis.

Table 1 shows the results of the descriptive analysis scores obtained from "Integrative STEM Teaching Intention Questionnaire".

Table 1. Descriptive analysis results of the "Integrative STEM Teaching Intention Questionnaire"

Name of the scale	Sub-factors	N	X	s
Integrative STEM Teaching Intention Questionnaire	Knowledge	104	5,48	1,04
	Value	104	6,30	,69
	Attitude	104	6,00	,85
	Subjective norm	104	5,09	1,13
	Behavioral control and behavioral intention	104	6,15	,65
	Total	104	5,89	,64

Findings of the quantitative part of the current research revealed that intentions of the pre-service teachers about knowledge, value, attitude, subjective norm, perceived behavioral control and behavioral intention were generally positive. According to the sub-factors of the scale, one of the sub-factors (value) level were "I agree exactly", three of the sub-factors (knowledge, attitude, perceived behavioral control and behavioral intention) level was "I agree" and one sub-factor's (subjective norm) level was "I rather agree". The findings showed that pre-service teachers' STEM teaching intentions were high.

Findings of the qualitative part of the current research, various sub-themes and categories obtained from the interviews are shown in the following tables, the findings were presented comparatively, the examples were given by direct citations, and some deductions were made about the differences obtained from the findings. The first theme, its' sub-themes and categories obtained from the data analysis of semi-structured interviews presented in Table 2.

Table 2. Sub-themes and categories under the main theme of STEM and STEAM

Theme	Sub-themes	Categories
STEM and STEAM	Definition of STEM	Interdisciplinary connection
	Reason for STEM	Adaptation to requirements of age
		Relation of science fields
		To develop the community
	Reason for STEAM (STEM + Art)	Social requirement for art culture
		Need for aesthetics
		Contribution to human psychology (relaxation, fun)
	Connection to everyday life	Contribution to the solution of the problems of life
		Support for creative practices
		Understanding the connection between life and science

The participants expressed their thoughts about "STEM and STEAM". Ahmet said "It is the combination of science, math and technology courses that create a interdisciplinary connection and teaching the students about different branches in a joint way and making them practice likewise".

In the sub-theme “*Reason for STEM*”, Hanife also said “*Interdisciplinary dialogs have become more integrated over the last century. The more the modern technology advances the more it is needed. If you do some work on physics, mathematics gets involved. These were gathered under a roof and given a name. I think this was made with the purpose of educating students in line with the requirements of the modern time*”.

Erkan said, on the other hand, about “*Reason for STEAM*” sub-theme, “*People are always more comfortable with art, it is easier to practice. So, although engineering or math is quite terminological, including theatre, drama, painting, poetry, music, visual arts, etc. into them would make student more comfortable. Studying them would become more enjoyable*”. In the sub-theme “*Connection to everyday life*”,

In the theme “*STEM and STEAM*” about the sub-theme “*Connection to everyday life*”, Mahmut said, “*Designing a project in STEM is a perfect practice for finding a solution for an everyday problem and it is very creative. Students can also use what they learn in courses in their daily life*”.

The second theme and its’ sub-themes and categories obtained from the data analysis of semi-structured interviews presented in Table 3.

Table 3. Sub-themes and categories under the main theme of STEM practices and education

Theme	Sub-themes	Categories
STEM practices and education	Advantages of STEM practices	Development of the sense of curiosity and research
		Permanent learning
	Disadvantages of STEM practices	Ability to work collaboratively
		Contribution to the choice of profession
		Takes a long time
STEM practices and education	Personal beliefs in STEM education	Teacher's lack of knowledge about STEM
		Economic problems
		Incompatibility with the exam system
	Suggestions for STEM education	Believe in ease of practice
		Believe in that success of practices will increase with experience
STEM practices and education	Suggestions for STEM education	STEM practices contribute to teachers and teacher candidates in school experience courses
		Teacher candidates can do project works in faculties for education methods (science education, mathematics education, etc.) courses
		Seminars and practical courses can be organized for teachers
		School principals should be informed about STEM so that they can guide the teachers in the school

In the theme “*STEM practices and education*” about the sub-theme “*Advantages of STEM practices*”, Remziye said “*First of all, I think STEM practices are fun for the child. It enhances the sense of wonder. They learn to research. They gain a lot at the same time. They learn that they are all integrated*”, and Nilay said “*It contributes to the children in that they learn what the teamwork is, respect for other ideas and they learn to think more creatively. From my point of view, while my students learn more effectively they also play a more active role in the classes. Learning becomes permanent for students*”.

In the sub-theme “*Disadvantages of STEM practices*”, Mahmut said “*It definitely has a disadvantage. After all, it takes a lot of time. Also you can't teach everything in detail. For instance, the exams were TEOG or something like that. There are really ridiculous questions in that exam. I don't think we can cover everything of the subject through this STEM method. Students may not solve the current question types in the exam*”, Remziye said “*It is a disadvantage that it is a long term practice. Teaching math while referring to science, math, engineering or art instead of passing the information directly would take a long time*”.

In the theme “*STEM practices and education*” about the sub-theme “*Personal beliefs in STEM education*”, Erkan said “*I think I can implement STEM quite willingly. It is already within the possibilities, though. I think we can implement STEM education no matter where we are in our country. I think I can achieve a lot with low cost. I would use STEM in my class*” and Ahmet said “*After I gain more insight about my professional life in a year, It might be more prospective. I might struggle in my first year. But later on, I think I may use STEM for implementation and education in class easily*”.

In the sub-theme “*Suggestions for STEM education*”, Hanife said “*Applied courses are possible. For example, teacher candidates that go to schools for training, in other words to take "school experience" course may compromise with the teachers there and teach this course together in second semester. They can implement STEM together in the class*” and also Mahmut said “*Although seminars and conferences are organized there*”.

can be teachers that are unavailable and uninformed. This is a big problem. We must inform those teachers in one way or another. First, principals should be informed and educated about this practice and then they should play an active role in the education of teachers”.

Conclusions

The quantitative results of the current research showed that pre-service teachers' STEM teaching intentions were high. In the research that Kırılmazkaya (2017) conducted, it is identified that the class instructors have a general positive view towards STEM education.

In the current research, according to the sub-factors of the scale, one of the sub-factors (value) level were “I agree exactly”, three of the sub-factors (knowledge, attitude, perceived behavioral control and behavioral intention) level was “I agree”. As a result of the STEM teaching intentions study conducted by Kırılmazkaya (2017) it was stated that the STEM teaching orientations corresponded to the "agreeing" range of views of STEM teaching orientation in values, attitude, perceived behavioral control and behavioral orientation dimensions. This finding shows similarity with the studies that express that the teacher candidates have positive attitudes towards STEM education (Adams, Miller, Saul & Pegg, 2014; Çorlu, Capraro & Çorlu, 2015). In the literature, there are studies investigating the attitudes of teacher candidates towards teaching STEM. In some researches carried out, it has been revealed that, it was concluded that the prospective teachers were in a positive attitude towards teaching STEM (Akaygün ve Aslan-Tutak, 2016; Çorlu, Capraro & Çorlu, 2015).

According to the result of the qualitative part, it was shown that the teacher candidates believed themselves using STEM in their classes and if they had problems they believed to solve them while implementation of STEM. Also they believed the importance of STEM teaching. The opposite results according to current research was Yıldırım and Selvi's (2016) study, in their study, show that teacher candidates do not have not enough knowledge and ability in STEM education and that it is difficult to associate STEM knowledge with everyday life practices and at the same time have some misconceptions about STEM education.

In the light of the results, it may be advised to conduct new studies in different branches and with different scales in a larger sample group due to the fact that different results have been obtained both in the literature and in the current study.

It may be advised that the academicians can implement STEM in their teaching method courses with pre-service teachers.

Mixed method is used in this study and case studies or action researches may be conducted in order to obtain in-depth results in schools with teachers.

Problems And Trends In South Korean Lifelong Education

Kang-Sik KIM

School of Business Korea Aerospace University South Korea
kskim@kau.ac.kr

Abstract

This paper focused on the characteristics, problems and trends in Korean lifelong education policy. Major Characteristics of the Korean lifelong education policy are seen as government's leadership, program provisions focusing on humanities and cultural refinement, high rates of participation in lifelong learning, insufficient policy-making from the learners' point of view, role of NILE as a flagship policy implementation agency, and evidence-based plan and research. Furthermore, SWOT analysis, a strategic planning method used commonly with a broad range of projects or initiatives, was performed on the Korean lifelong education policy. Finally, for the improvement of lifelong education some suggestions were made, for instance, it is required to emphasize public awareness, promotion and the development of cultural sensitivity, to diversify the sources of education programs, to build networks between them, to maintain a balance between educational opportunities for the rich and the poor, and to establish a nation-wide recognition and validation system for the outcomes of adult and lifelong education.

Introduction

It has not been an easy task to build a nation-wide lifelong learning and education system given the historical and socio-economic context of Korean society. The initiative was initiated while the country's education experts were still concerned with school education as the next-generation visions and the people were more focusing on providing formal education to their children and supporting them get ready for entrance exams, rather than pursuing the realization of their own needs for lifelong learning. In short, the overall climate, historical and cultural tradition and socio-economic basis of the country were less than perfect advocates of lifelong learning and adult education policies to bring the agenda to the spotlight of policy-making and to start building a feasible system. Nevertheless, Korean society has performed a progress for itself from a social education-oriented state to a lifelong learning oriented stage. The society is also in the process of refining the transition in the form of a nation system. Korea is performing its transition from a literacy-challenged country into a lifelong learning-leading one. Behind the transformation lies a contributing factor that was the remarkable development of school education and diffusion of higher education among Koreans. In virtue of continued growth of adult education and common integration of lifelong learning, Korean society is striving yet another leap forward to get development as a lifelong learning society.

Building a policy framework for adult education in the acute circumstances and improving it towards the ultimate policy goal of creating a lifelong learning society has not only compromises made in real terms, but also required strategies rested on unconventional methodology. That the country has created tangible outcomes and systems out of its lack of preparation indicates that its lifelong education policy strategy has been in association with its diffusion of school education. Namely, the course in lifelong education policy that Korea has taken was not the best option essentially; it was rather a second-best choice based on real-life considerations. Thus, one should find strategic significance not in the course itself but in the dynamic interactions between internal and external conditions, circumstances and environments that have forced the country to take such a course.

Characteristics Of Lifelong Education In Korea

The characteristics of the Korean lifelong education have carried out both as policy-promoting factors and potentially compromising ones that forbid the country attaining further development in lifelong learning. Some of the major characteristics of the Korean lifelong education policy development are summarized as follows.

Government's leadership, implementation agencies and legal systems

Among countries around the world that have reported on adult learning policies, only about half have indicated adult education as an independent national policy-making plan. Even these countries are not implementing policies through separate, independent adult education laws. Instead, they are utilizing special provisions included in their education law. Mostly, their adult education policies are performed as provisional programs, requiring a broad structure, budgets and legal support. However, Korea has made adult education as part of its leading action for encouraging a lifelong learning framework legal and clearly installed implementation organizations and long-term policy plans (UNESCO UIL, 2010).

Many countries choose a top-down bureaucratic style of centrally-managing adult education funds granted from international development organizations or overseas ODA. They have various impressive highest-ranking commissions and committees that stand only in name. Moreover, their comparatively tight-budgeted local governments have no choice but to rely on their central government's national organizations for survival. Thus, it is very difficult to implement regionally-sensitive adult education policies (Ahmed, 2009). In comparison, Korean adult education policy is led by clearly defined leadership by the central government and is supervised based on a conciliatory approach that at the same time recognizes the regional implementation systems and demands regional initiatives and matching funds. In spite of the obvious leadership by the central government, actual programming and performance evaluations are performed out by the leadership of local governing bodies. By reason of higher power by local governments in securing budgets than the one by the central government, a bottom-up approach in policy development and benchmarking is prevailing.

program provisions focusing on humanities and cultural refinement

In most countries, adult education is pursued with regard to two goals, vocational ability development and social integration, with a tendency to put more emphasis on the former. Adult education policies concentrating on human resources development are gaining in particular strong impetus. Private capital is merging with public capital to take part in education sector and create an immense adult education and training market (Medel-Anonuevo, 2003). However, in Korea adult education and adult training are separated, and the learners' participation in non-vocational education (in terms of rates and number of hours invested) is higher than their involvement in work-related training. One of the reasons of these phenomena is that the country still has relatively lower employment rates compared to other advanced countries, and thus stay-at-home mothers and other non-working demographic groups enjoy participating regularly in non-vocational adult learning.

In contrast, the active working populations are subjected to the nearly universal lack of time and money to spend on learning other than compulsory education. Also, in Korea, there is not enough sufficient connecting system between vocational training and academic diploma which is regulated by the Ministry of Education and the Ministry of Employment and Labor respectively. The former mostly handles the supervision of academic ability-related programs, complementary education programs, the establishment of academic certification systems for adult learning outcomes, and the implementation of educational support projects for lower-income learners and etc. On the contrary, the Ministry of Employment and Labor independently implements vocational training and work-skill development programs under the certification framework.

High rates of participation in lifelong learning

Countries around the world can be divided into four groups correspondingly their people's level of participation in lifelong learning. Group A consists of countries (mostly Northern European states) that top 50% participation rates. Group B includes countries showing 35-50% participation rates, including Anglo-Saxon countries and some European states (Austria, Luxemburg, the Netherlands and Switzerland). Group C consists of mostly Eastern European countries, several Southern European states and emerging countries in Asia with a 20-35% participation rate. Lastly, Group D includes countries with less than 20% participation rates, such as Eastern/Southern European countries (Portugal, Greece and Poland), South American countries and the majority of countries in the rest of the world (UNESCO, 2007). Korea belongs to Group C, likewise similarly performing countries in terms of participation rates - e.g., the Czech Republic, Spain and Australia. Interestingly, when considering per-capita income, which has a correlation with the rate of lifelong learning participation, European countries with a similar level of national income have all shown lower participation rates than that of Korea. Taking that fact into account, Korea's lifelong learning participation against its per-capita income is considered to be relatively high (Han, 2010).

Insufficient policy-making from the learners' point of view

It can be allowed that Korea has built, supplied and expanded a lifelong education program led by strong public initiatives, and has encouraged the socially weak to participate in learning. Instead, there has been very little support for improving conditions that will be more inductive to learning as seen from the learners' point of view. For example, paid or unpaid vacation for learning is more or less not very common in Korean society. Funding for learning is available through only a handful of circumstances including vocational skill development and practical training. As a whole, lifelong learning policy as a means to supply education is being actively put into place on the national and local government and private levels. Notwithstanding, this relatively insufficient support is ready for use in practical matters, such as funding to directly promote learners' participation as in the number of hours spent in learning, educational expenses and increased access to opportunities to get learning. Evaluation of the policy implementation discloses one distinct characteristic of the Korean lifelong education policy. That is the imbalance existing between support for education supply and support for learner demands.

Role of NILE as a flagship policy implementation agency

There are many countries, which have a semi-governmental agency(s) and/or government-funded private organization(s) that lead the countries' adult education and lifelong learning policies. For example, there is NIACE (National Institute of Adult Continuing Education) in England and Wales; ALA (Adult Learning Australia Inc.) in Australia; and DVV (Deutscher Volkshochschul-Verband) or the German Adult Education Association in Germany. Korea has a similar institution called the National Institute for Lifelong Education (NILE), which is being recognized as an agency representing the superiority of Korea's lifelong education program. NILE is producing competitive outcomes regarding planning, work scope and performance compared to its overseas counterparts. The biggest role of NILE is to present a blueprint for the country's future lifelong learning framework by establishing the Comprehensive Lifelong Learning Development Plan (CLLDP). Korea's Lifelong Education Act (LEA), which was amended in 2007, assists the central and metropolitan (city and provincial) governments to establish and update CLLDP to help promote lifelong learning and report to the Minister of Education on a regular basis. Having been updated twice over the past decade, CLLDP has fulfilled its mission of leading the lifelong education policy and its implementation along the long-term planning. The plan's latest edition divides adult education practice regarding a learner's developmental stages and prepares to start programs and legal systems that strive for achieving balanced growth between the stages (Presidential Committee on Education Innovation, 2007).

Evidence-based plan and research

In order to promote more scientific management of lifelong education policy, surveys and studies have been conducted. These were carried out by routinely compiling statistical data on the practice of lifelong education and giving surveys on adult learners' learning practices (Lengrand, 1979). Adopting the latest approach of evidence-based research and consequently providing reference data, the surveys and studies help identify the Korean people's lifelong learning patterns and can therefore provide a kind of infrastructure upon which the government could plan out detailed policies. The surveys started in 2007 and have been performed on a yearly basis since. This type of annual survey implementation is a slightly rare practice compared to many countries around the world.

Assessment Of Korean Lifelong Education System

In this paper, Korea's lifelong education policy was defined as an adult education policy that intends to establish a paradigm on the lifelong learning society. For the success of the policy, several considerations can be suggested. First, adult education programs should be provided and policies be offered to promote the participation of adult learners. Second, the policy should be subjected to reflection for its visions and prospects, and be permitted to define itself as it progresses conjointly society's development to a lifelong learning framework. Third, on the base of the visions, a more active initiative is required to build robust, organic networks between core education areas which include school and higher education, and non-core education areas like culture, employment and welfare. SWOT (Strengths, Weaknesses, Opportunities, and Threats) analysis, a strategic planning method used commonly with a broad range of projects or initiatives, was performed on the Korean lifelong education policy. The results are summarized below (Han, 2010).

Strengths

Lifelong education and learning in Korea is growing firmly based on the result of the country's solid public education and the signature, nation-wide enthusiasm for education. Specifically, now that the country has entered into a fully developed phase of disseminating higher education, educational planning may come to pass with highly educated learners as one of its main targets (Han, 2008). Also, the relatively equal opportunity in school education and the distribution system across the education sector contributes positively to the equal opportunity in adult education as well. Korea has a highly developed modern legal system that supports the continuing implementation of lifelong education policies, and government agencies that manage the policy implementation exclusively. Presently, there are only a few countries around the world that have both the lifelong education law and policy implementation system. Successful implementation cases are often found among the countries with exclusive agencies and legal programs besides the law and the system. There are quite a few lifelong education research groups and experts available in Korea, making it easier for the country to secure expertise in lifelong education policy. Having an sufficient group of lifelong education specialists is a phenomenon seen rarely in the world. That advantage greatly facilitates the connection and collaboration between higher educational institutions and implementation programs in Korea.

Weaknesses

The insufficient public investment in lifelong education is one of the biggest weaknesses. Public investments in adult education are very small compared with those in school education. School-aged children aged 6 to 18 get the most investment, while adults aged 20 to 65 receive the least amount of investment, which remains an obstinate trend that adult education is viewed as an "out-of-pocket" affair. Learning is understood in relatively narrow terms.

That is, it is considered as one of the social functions including developing leisure and pastime skills, securing employment and increasing cultural sensitivity rather than as part of the core task of human beings (i.e., development and growth over a lifetime). Namely, lifelong education is regarded not so much as a policy framework geared towards next-generation education reforms but more as the supply of education happening at some lifelong learning centers. Working hours of Korean employees are much longer than those of OECD member states. Thus, Koreans undergo a lack in time and money to invest in learning. Unfortunately, as household income and finance is affected by the global economic crisis, Korean adults' opportunities for aggressive personal development are decreasing, which leaves workers who are on the turning point of losing their jobs and possibly become depending on the national welfare system.

Opportunities

By reducing, and thus being mostly freed from the burden of having to provide basic literacy training to the people, Korea has been securing the infrastructure with which to satisfy the increasingly diverse needs for the lifelong learning of Korea's adults. The country's wide spread elementary, middle and high school education and very high rates of entering into higher education programs are contributing to the fast-extinct ratio of illiterate individuals in the society while at once they promote a large clientele enthusiastic about satisfying their strong needs for learning through a practice of lifelong learning. Korea is rapidly becoming an aging society. This is taking place in tandem with Korean society's fast-changing perception of lifelong learning and "re-designing" one's life. Many Koreans even plan their post-retirement years when still in early adulthood. They are also anxious more about their lives and engage more actively in initiatives geared towards developing post-retirement or old-age competency. Recently, Korea's academic certification system has begun restructuring as led by the Ministry of Education and the Ministry of Employment and Labor. This is contributing to the rising demand for certificates, licenses and permits and for ongoing education among Korean learners. Well-established academic certification system is known to help increase the need for learning. Korean society's demand for and awareness of arts, humanities and high-class culture programs are expanding. Increases in numbers living as part of the elite class with more money and time on their hands, as well as their need for prestige and luxury, are rapidly forming a new breed of learning markets (Han, 2000).

Threats

Korea's tradition of valuing academic degrees is obstinately viable. Therefore, lifelong learning in Korea confronts the risk of expanding an already "degree-obsessed" society by misusing the systems and programs created originally to realize a lifelong learning society as an secondary means to earn a college degree. Notwithstanding that Korea is expanding its public investment in lifelong learning with its public lifelong educational institutions growing at their maximum, the pace of growth falls short of the government's expectation. That gap, if remaining steadily, will likely be filled rapidly with for-profit education service providers. In that case, Korea's lifelong education system that has been established for years could be compromised and the division of Korean society may speed up according to the expanding market for lifelong learning.

Discussion: Suggestions For International Cooperation

Lifelong education can be carried out only on the stable foundation of basic public education. The development of general education through public education is the condition for the development and implementation of the lifelong education policy. It is important to set goals for the policy and to build independent bodies of related laws and regulations. The majority of successful instruments of implementation of the lifelong education policy have efficient authorities that independently manage the policy. Issues in lifelong education must be considered by policy makers are as follows: continuous initiatives in order to increase people's participation and the creation of a lifelong learning society - a new context and a concrete policy goal. Only efforts with vision can successfully lead the policy to build a lifelong learning society. It is required to emphasize public awareness, promotion and the development of cultural sensitivity in order to help expand people's participation in learning as it becomes more necessary to their daily lives. Moreover, it is needed that the sources of education programs should be diversified and networks between them should be formed. This is necessary in ensuring that adult education is well balanced efforts including literacy, humanities and cultural refinement, technical training and specialized education all within its sphere. A balance between educational opportunities for the rich and the poor should be maintained. Provided economic growth continues world-wide, demand for the former will lessen finally, whereas demand for the latter will continue to increase. The right time for a system-to-system transition is deeply related to the migration of the balancing point between these two types of education. It is also required, to establish a nation-wide recognition and validation system for the outcomes of adult and lifelong education.

As a whole, dynamics between learning and academic certification serves as the driving force behind the growth of adult education. Countries need to nurture and train lifelong education professionals with greater vigor and enthusiasm, and assign them first and foremost to public adult education programs. They act as the source that

enables the establishment of lifelong learning framework. No policy is successful without feasible data to back it up. Thus, countries should participate in surveying adult learners' participation in lifelong learning, like the one given on OECD member states, and should devote to their own statistical survey of lifelong education facilities. Macro indexes will add great power to building and implementing the policy.

Problems Faced By Teachers Of Gifted / Talented Students

Dr. Metin ÇENGEL
Sakarya University, Education Faculty
cengel@sakarya.edu.tr

Dr. Ayşe ALKAN
ayshe_alkan@hotmail.com

Abstract

The purpose of this research is to identify the problems faced by teachers with gifted / talented children. The study was conducted in 2017-2018 academic year and includes the teachers of the children whose children are gifted / intelligent. In addition to the demographic information of the teachers in the study, the perspective of the society as a teacher with a talented / intelligent student, where the teachers helped the children to learn what they should do as a teacher with a gifted / talented student who had problems with themselves or other members of the family, It has been tried not to be determined through open-ended questions, whether there is a private center or institution that is continuing outside the Art Center, whether the students have received relevant guidance support, and what kind of support they need. The data were evaluated by the content analysis technique of the qualitative data analysis method. Nvivo 10 program was used for qualitative data analysis. As a result of the research, the problems experienced by the teachers of the gifted / talented students were determined and suggested solutions. They also tried to get an idea of what the problems would be in their research.

Key words: *Gifted, talented, teacher*

Introduction

It is known that those who direct the important developments in the world are highly talented individuals. While the development of gifted students in line with their abilities has advantages both in terms of themselves and society, it is a disadvantage that these students are not developed in line with their abilities. The lack of support for the positive features of students with superior ability may have some negative consequences for students with disabilities or gifted students. These negative behaviors can be mischievous, unresponsive to the school, unsuccessful, unspeakable jokes and speeches that will escape the peace of the class. Therefore, the identification of students with superior ability requires special knowledge and expertise. In the classroom environment where individuals with superior ability are present, the negative behavior of some of these children may lead to disciplinary problems in the classroom environment.

Ataman (1998) refers to gifted children as individuals with superior performance or intellectually superior to their peers in terms of mental abilities or intelligence, strong creativity as well as high sense of accomplishment in beginning work. In the I. Special Education Council, the "gifted" in terms of their general or special abilities are defined by their experts as being determined to perform at a high level according to their peers (MEB, 1991). Renzulli (1978), who stated that men and women of high talent had attracted the attention of people throughout history, speaks of the three talents of superior talents. These are talent above normal, relativity at higher levels and creativity at higher levels.

Highly talented students in education institutions continue their education together with their peers. By discovering these students, teachers can prepare enriched programs for these students and they can be directed to the Science and Arts Centers that provide education in the direction of the potential of non-school students in our country. The tests to determine gifted students take a long time and there are not enough number of guidance teachers to perform these tests. This is why teachers are not aware of their students' observations and experiences without labeling their students. The early identification of gifted students, their development in the direction of their abilities and the possible negative behaviors can be remedied by the teachers in the educational institutions knowing and directing the characteristics of these students. When the studies are examined, it is found that the teachers in the educational institutions are deficient in knowing the characteristics of the gifted students and determining these students (Alkan, 2013).

The identification of the problems experienced by gifted students and the opinions of teachers living in classrooms with them is important for the education of gifted students and the solution of their problems. With this in mind, the problems faced by teachers who directly observe the behaviors of gifted students in the research are examined.

- "What are the problems faced by teachers who are gifted students? Format. The following questions were searched within the framework of this problem.
- What kind of students do you consider to be special education?
- What special education groups did you belong to?
- What kind of features do students have in mind when it comes to gifted / talented students?
- Do you have gifted / talented students in your class? What distinguishes this student / student from other students?

- Are your gifted / talented students in your class experiencing problems in class / school (with other students or with you)?
- In your opinion, is the school environment sufficient to meet the needs of gifted / talented students? If not, what can be done?

Purpose Of The Research

In the scope of the study, it was aimed to reveal the problems encountered by the teachers who have gifted / intelligent knowledge to their students.

Method

In this section, information about research model, universe and sampling, data collection tool, data collection and analysis will be given.

Model Of Your Research

Survey screening model was applied. The main purpose of screening research is to describe the situation as it exists. Everything that is subject to research is tried to be defined as if it is within its own conditions (Karasar, 2005). The answers taken by teachers from open-ended questions constitute the screening part of the data.

Universe And Sampling

The universe of the research is composed of teachers who have gifted / intelligent knowledge to their students during 2017/2018 education period. The sample is composed of 54 teachers in various branches with a gifted / intelligent recognition to their students during 2017/2018 education period. The data were obtained by face-to-face interview with 54 teachers.

Data Collection And Analysis

In the research, the opinions of the teachers who have gifted / intelligent gifted to their students, scale questions prepared by the researchers and face to face interview method were collected. The scale consists of two parts. The first part consists of the items that teachers want to get demographic information and the second part consists of the difficulties they have with regard to having a gifted student. SPSS program and Nvivo 10 program were utilized in the analysis of the data.

Findings And Comment

- Demographic questions from the scale in this study consist of closed-ended questions. Teachers were asked open-ended questions about their views. Demographic questions were analyzed by frequency (quantitative) and open ended questions were analyzed by content (qualitative).
- Teachers' demographic characteristics
- Branches
- Vocational seniorities
- Educational status,
- The information on the education of children with special needs is given in the following tables.

1- Participant Branches

Table 1. Survey Branches

Participants Branches	Frequency	Percent
math	7	%13
The English	8	%16
Classroom Teacher	7	%13
Turkish	5	%9
Physical education	4	%8
Social studies	3	%5
science	6	%11
Religion culture	3	%5
Computer	2	%4
Visual arts	3	%5
Music	2	%4
PDR	3	%5
Pre-school	1	%2
Total	54	%100

As Table 1 reveals, most of the respondents are branch teachers.

2- Participant Professional Seniority

Table 2. Occupational Seniority

Participants Vocational Senior	Frequency	Percent
1-5	19	%36
6-10	19	%36
11-15	11	%20
16-20	0	%0
20-Top	5	%8
Total	54	%100

As seen in Table 2, the occupational seniority of teachers is mainly composed of the first 10 years of teachers. As a result of research conducted by Rash and Miller (2000) on the examination of the practices of teachers of gifted students, a positive correlation was found between the use of different methods as the duration of the teachers' professional experience and their work with gifted talents increased.

3-Educational Levels of Participant Teachers

Table 3. Teacher Education Levels

Teacher Education Levels	Frequency	Percent
License	38	%71
Graduate	13	%24
Doctorate	3	%5
Total	54	%100

Table 3 shows that the level of education of teachers at doctoral level is very low.

4-Are you trained in "special needs children" in university?

Table 4. Teachers Receiving Special Education

Special Education	Frequency	Percent
Yes	14	%25
No	40	%75
Total	54	%100

Table 4 shows that very few of our teachers have been trained in special needs children in university education. A study conducted by Hansen and Feldhusen (1994) with a study of trained and untrained teachers of gifted students shows that trained teachers for the training of gifted talents exhibit better teaching skills and a more positive classroom environment than untrained teachers for gifted talent. In this case, the teachers participating in the research show that they will have difficulty in solving the problems with special children. As a result of the questionnaire survey conducted by the Science Art Center in the process internal audit report (MEB, 2010), a large majority of respondents agree that the teachers in the schools do not have enough knowledge about the distinguishing features of gifted or gifted students.

5- Do you have in-service training about "children with special needs"?

Table 5. Teachers Receiving In-Service Training

In-service Training	Frequency	Percent
Yes	12	%22
No	42	%78
Collection	54	%100

Table 5 shows that very little of the teachers' special needs children are receiving in-service training. This shows that teachers have difficulty in solving problems with special children. Mills (2003) conducted a survey titled "Characteristic Characteristics of Effective Teachers in the Education of Gifted Children: Teachers' Past Experiences and Students' Personality Types" they do not have a certificate. The study of Nugent and Shaunessy (2003) on "Using Film in Teacher Training: Giftedness from Different Lenses" shows that the quality, social and emotional needs of the gifted students in the films after pre-service, in-service and after-service teachers' their parents' problems, the characteristics of their teachers, the availability of films related to available strategies, and the fact that these films are not used and used too much in teacher education.

As a result of the work titled "In-service Training Needs of Elementary School Teachers Related to Education" in Gültekin, Çubukçu and Dal, (2010), primary school teachers should be informed about student education, teaching planning, material development, teaching, managing teaching, It has been understood that they need training in all areas of competence, such as building, developing basic skills, serving special needs students, educating adults, having extracurricular activities, self-improvement, school development, and improving school-environment relationships.

6-What kind of students do you think are included in special education? The themes and sub-themes obtained from the answers given by the teachers in question.

Table 6. Themes and Sub-themes

Question	Theme	Sub themes
Which students do you understand as special education?	Children with intelligence back and forth 35%	Outstanding children Children above standard Children under the standard Those with developmental disabilities
	Different thinking 30%	Children with superior character Failed children Children who need individual attention Understanding children Children with high perception ability
	Gifted and disabled children 20%	Children with learning disabilities Failed children Mainstreaming students Children who need special attention and interest
	Children with learning strength 15%	Children out of normal education Children whose level of learning is different from normal students Mental retardation Autistic children Children with down's syndrome

As can be understood from Table 6, teachers have very different opinions in defining special children. It is understood from the above table that many teachers make literate definitions for special children, even though they do not receive education.

7-Which students belong to which special education groups? Themes and sub-themes of the answers given in the question.

Table 7. Themes and Sub-themes

Question	Theme	Sub themes
What special training group do you have?	Gifted 35%	Bilsem Student Going to the Children's University Special Education
	Mentally handicapped 20%	Light mental Middle Mental Advanced mental Having a learning disability
	Autistic 10%	Light Middle Advanced
	DEHB %5	Hyperactive Lack of attention

		Dyslexia
	Down %5	can learn can not learn
	No %25	Never met I do not know if I compared it I know these kind of students, Not in my class.

From Table 7, it can be seen that the most prevalent among the special children is the mentally retarded in the other group of gifted students.

8-Students who have what kind of characteristics are considered as gifted / intelligent students come to your mind, the themes and sub-themes related to the answers given in the question.

Table 8. Themes and Sub-themes

Question	Theme	Sub themes
What qualities do children have when it comes to gifted talent?	Quick on the draw 30%	Quick learner Academic success is high Easy to implement You can think of it as versatile
	Self-confident 25%	Trouble listening to lesson Academic failure is low Innovator Having new ideas
	Resolve problems quickly 20%	Quick thinking Different thinking Comment katan Who have their own truths
	Communication is weak 15%	Asocial Alone Incompatible Rebel and spoiled
	Analytical thinking and questioning 10%	Leader Insistent investigating detailed eye

The data in Table 8 show that teachers responded well to gifted students' behaviors they had shown. It is a promising future for the solution of problems of gifted children in the future. In a meta-study of Moore's (2009) study on teacher perceptions of academic superiority in elementary school classes, qualitative research has shown that teachers have a gifted education and positive thinking about identifying gifted children.

9-Are your gifted / talented students in your class experiencing problems in class / school (with other students or with you)? How is your approach to the problems you are experiencing? Themes and sub-themes of the answers given in the question.

Table 9. Themes and Sub-themes

Question	Theme	Sub themes
Do you have problems with your students? How do you solve it?	No problem 55%	I never met I did not live No problem
	I'm having a problem 35%	Attention Deficit (Warning, Motivation, Orientation, Different education, Empathy) Incompatibility (group work, help from guidance service, family discussion, referral to social activities)

		Self Confidence Explosion (Additional study, direction to research, preparation of presentation, project making)
Rarely 10%		Breaking the Classroom (Warning, Guidance, Parental Interview) Seeing yourself differently (Orientation in the direction of the ability to identify areas of interest)

In Table 9, the teachers are mainly given no answers. They either have trouble finding a solution or they may not want to expose problems because they are usually investigated in private schools.

10-Are your school environments sufficient to meet the needs of gifted / talented students? If not, how can it be done? Themes and sub-themes of the answers given in the question.

Table 9. Themes and Sub-themes

Question	Theme	Sub themes
Are the needs of talented students satisfied? What can be done?	Enough 25%	Out-of-school expert support can be better
	Partially Enough 30%	Teachers must be trained in these children There must be workshops for such children
	Insufficient 45%	Custom classes must be created Ensure environment for project work

An important part of the teachers in Table 10 states that school environments are inadequate for educational environments for gifted students. In this case, it can be said that our country needs to prepare enriched environments for these children, which is an important wealth in terms of human resources.

Conclusion And Discussion

Surveys were reached through face-to-face interviews with teachers working in various state and private schools of various countries. There are 54 teachers in various branches of the research. When the data from our teachers contributing to the study were analyzed, it was determined that most of our teachers were undergraduates and very few were trained in faculties where special needs children were taught and in in-service trainings. In this case, it was observed that our teachers could have problems with the behavior that they should exhibit when they meet children with superior ability. The answers to the qualitative questions of the research were carried out by qualitative analysis methods and it was observed that the teachers with gifted students who were diagnosed according to the answers to the questions had problems. They are hesitant about what to do to solve their problems and which organizations may apply. Teachers can not get the necessary support because of the limited number of institutions that can respond to their problems. Official and non-governmental organizations can be used to reach teachers by providing materials such as seminars, films, books, posters and brochures that will inform the teachers about the education of highly talented students. Raising consciousness training in all sections of the society on the issue of diagnosed children can be helped to overcome the problems of teachers who are aware of the fact that these children are very important values in terms of our country and have a talented student in their class. Educating high-gifted learners about how to behave towards these students, organizing appropriate training programs and preparing appropriate training environments can be an important step for the future of our country.

Suggestions

- Teachers with gifted students can introduce common skills of gifted children and gain the ability to cope with these characteristics.
- Teachers with gifted students can be trained to gain listening, communication, time management and social skills.
- Considering the common characteristics of gifted students, efforts to address the needs of organized education can be increased.
- Observed shortcomings of Science and Art Centers can be eliminated.
- Official and non-governmental organizations can be used to reach families by providing materials such as seminars, films, books, banners and brochures to inform parents about the education of highly talented students.
- Improvement of the school environment of gifted students can be done.

- Gifted students can establish workshops for schools to reveal the skills of students.
- For children with special abilities at the genius level, separate schools can be upgraded to an educational model. Depending on the facilities, such kind of schools can be opened in certain regions.

Abstract

To respect diversity, fostering intercultural competence among students is an important goal of public education, including universities worldwide. As valid assessments are lacking, the aim of the present paper is to introduce a new learning model of intercultural competence and to empirically test the theoretical structure of the model. In the Process Model of Intercultural Competence (PICO-Model), intercultural competence is conceptualized as a lifelong self-regulated learning task in intercultural situations. For this model, theories on intercultural competence were combined with theories on self-regulated learning. In the present study, 236 university students were assessed by the newly developed questionnaire. Analyses with MPlus validated the factor structure of the questionnaire and demonstrated the usefulness of the PICO-model and questionnaire for university students.

Keywords: *Self-regulated learning, intercultural competence, learning model, intercultural social work, university students*

Introduction

Fostering intercultural competence among students is an important goal of many degree programs offered at universities worldwide. Assuming that the development of intercultural competence is a lifelong self-regulated learning task, it is important to better understand the learning process of students in intercultural situations. To model the learning process in intercultural situations, theories on self-regulated learning were innovatively combined with state-of-the-art scholarly knowledge on intercultural competence development. The aim of the present paper is (1) to introduce a new learning model of intercultural competence and (2) to empirically test the theoretical structure of the model. Based on the new theoretical model, we developed a self-report questionnaire to measure the relevant determinants.

Models Of Self-Regulated Learning

Theories on self-regulated learning (Pintrich, 2003; Zimmerman, 2000a) conceptualize learning as an active and adaptive process of learners to reach their goals. In the model of self-regulated learning developed by Zimmerman (2000a), the learning action of a learner consist of three phases, each comprising necessary motivational and volitional constructs (see figure 1). In the first phase (= forethought phase), a learning action is initiated and planned. Based on the expectancy-value theory of motivation (Wigfield & Eccles, 2000), learners start to learn if they believe that they can be successful in performing a task (= expectancy component) and if they consider the task to be important (= value component).

In the performance phase, the execution of the learning action takes place. Thus, learning only remains attractive for learners when they also know HOW to learn successfully (Weinstein & Hume, 1998). To control and regulate their learning, learners need to use various cognitive and metacognitive strategies (Pintrich, 1999). Finally, in the self-reflection phase, a functional assessment of the learning action happens, so that continued learning remains attractive in the future. Only persons who attribute success to their own merit and see failure as something that can be coped with and controlled will be able to maintain their appreciation for and expectation of success in the context of learning. Therefore, it is desirable that learners have a reference norm conducive to motivation, a functional style of attribution and strategies for how to deal with performance feedback (Weiner, 2005).

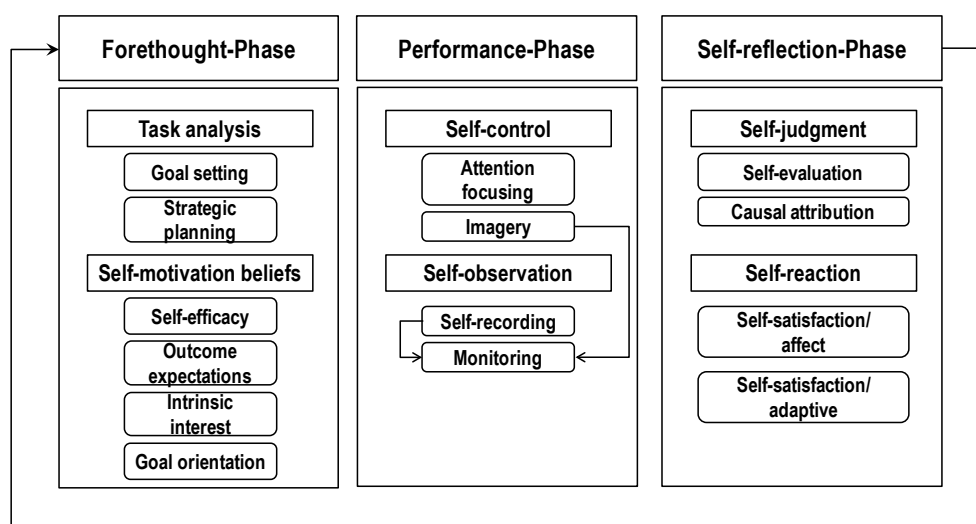

Figure 1. Model of Self-Regulated Learning (Zimmerman, 2000a)

Models Of Intercultural Competence

Acknowledging that social groups of any size can have their distinct cultures and that every individual belongs simultaneously to many different social groups, Barrett (2013) suggests applying an intergroup perspective to the concept of intercultural competence. According to the intergroup perspective, the context or the situation defines the importance of particular cultural affiliations. When cultural signs are salient and prompt individuals to shift their frame of reference, every situation can change from an interpersonal to an intercultural one.

In an intercultural situation, a huge number of key factors are considered as relevant for the development of intercultural competence. Common aspects of component models are three competence domains, namely (1) the knowledge domain, (2) the attitude domain, and (3) the communication domain. The knowledge domain includes aspects as knowledge about other cultures and subjects of own culture, knowledge about cultural similarities and differences, self-reflection, and personal development. The attitude domain includes aspects as empathy, openness, acceptance of inconsistencies, respect towards one's own and other cultures, and frustration tolerance. The communication domain contains aspects as communication skills, mediation skills, active engagement, and behavioural options (cp. Bolten, 2006; Erll & Gymnich, 2010; Spitzberg & Changnon, 2009; Ting-Toomey & Kurogi, 1998).

Although these models offer a useful structure to identify a multitude of personal characteristics, which are potentially necessary in an intercultural situation, they have also many shortcomings. The rather static view on "trait-like" personal characteristics of such models neglecting the dynamic, constructivist and developmental perspective of intercultural competence is a critical point (Hammer, 2015). Moreover, the lack of empirical validation of interconnections and causal pathways between the sets of cognitions, affects and behaviors suggested in the compositional models is problematic (cp. Barrett, 2013; Spitzberg & Changnon, 2009). Although there is a large number of measures available (Fantini, 2009), a review of available tests to assess intercultural competence (Matsumoto & Hwang, 2013) identified only three instruments which provided satisfying evidence regarding their underlying theoretical factors. Thus, there is still a need to develop theoretically sound measurements of intercultural competence.

To measure intercultural competence, we argue that it is important to shift the paradigm to the development of intercultural learning competence instead of conceptualizing intercultural competence as a trait-like personal characteristic. Such a paradigm shift offers several theoretical advantages. Most importantly, it implies that intercultural competence development is a life-long learning process (Deardorff, 2015). Consequently, any intercultural situation potentially offers new learning opportunities. Such a theoretical perspective also acknowledges that intercultural learning is a cyclical process, because learning actions follow each other as they are initiated, monitored and evaluated (for a similar approach see also Holmes & O'Neill, 2012).

Process Model Of Intercultural Competence

The Process Model of Intercultural Competence (PICO-Model) is an innovative combination of self-regulated learning theories and theories of intercultural competence, which acknowledges that intercultural competence is a cyclical learning process. Based on the model of self-regulated learning by Zimmerman (2000a), the development of intercultural competence in the PICO-model consist of three phases, the forethought phase, the performance phase, and the self-reflection phase.

In the *forethought phase*, learners (1) need to set their goals. Borrowing ideas from the composite models of intercultural competence (cp. Ting-Toomey & Kurogi, 1998), learners might want to improve their knowledge, attitudes or communication skills in an intercultural situation. For instance, they might wish to improve their knowledge regarding a particular country, their cultural perspective taking, or their ability to communicate. Thus, we theorize that from the perspective of the self-regulated learner the competence domains defined in the composite models of intercultural competence reflect potential learning goals in particular intercultural situations. The more learners aim to achieve particular goals during particular intercultural situations, the more their intercultural competence will develop over time.

Furthermore, learners will initiate a learning process in intercultural situations if they (1) believe that they can master the demands and they can influence things to their advantage, and if they understand their progress as evidence for their success. That means the learners need to have flexible implicit theories of learning, and a high intercultural self-efficacy and confidence in their own abilities (cp. Zimmerman, 2000b). Additionally, they need to be (2) interested in intercultural topics and their goal orientation should center on their personal development, that means high interest and a distinct goal of competence expansion (cp. Ames, 1990).

During the *performance phase* learners will (1) imagine their steps and instruct themselves how to proceed, (2) they are aware of and are able to manage their (negative) feelings, and (3) they show persistency especially when the situation turns out to be challenging. Learners (4) monitor and (5) record their behaviors, and (6) they try different strategies to find the most effective one. The PICO-Model assumes that the intercultural competence will improve over time depending on the frequency and quality of learners' strategy use during intercultural situations. During the *self-reflection-phase* competent learners will (1) evaluate their performance. After acting during an intercultural situation, it is helpful when the learners compare their performance with their initial goals. In both successes and failures, competent learners will ask themselves whether they put appropriate effort into the situation. When confronted with a failure, competent learners will analyze the situation to be able to identify aspects, which can be improved in future intercultural situations. Competent learners generally have a low level of feelings of helplessness but have plenty of ideas for adaptive reactions. The self-reflection-phase is also important for future performances. This is because the PICO-Model describes a cyclical learning process in which each reflection phase ultimately leads to the next *forethought phase* (cp. Strohmeier, Grading, & Wagner, 2017).

Empirical Study

The empirical study aims to test the theoretical structure of the model. In this study, we especially focus on the first phase of the self-regulated learning process, the *forethought phase* (see figure 2). We argue that the *forethought phase* is the most important learning phase because this phase comprises motivational beliefs necessary to initiate and plan an intercultural interaction. Heckhausen (1991) compared the *forethought* with "Caesar's step across the rubicon", that means, in this phase, the learners make the decision to start with the action phase of learning or not.

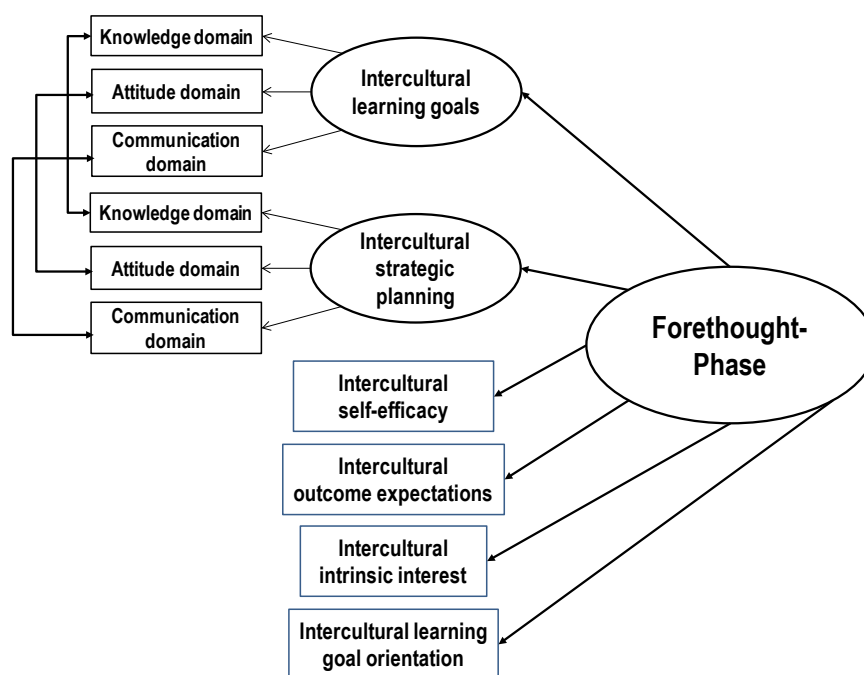

Figure 2. Process Model of Intercultural Competencies (PICO-Model) – Forethought Phase

Method

Participants

At the beginning of the academic year in 2012, all students ($n=262$) enrolled in either the bachelor or the master program of Social Work at the University of Applied Sciences Upper Austria were invited to participate in the study. Data collection took place during regular lessons at the University of Applied Sciences in the following week. The participation rate was very high (90%) and the final sample comprised 236 students; 169 students were enrolled in the bachelor program, and 67 students were enrolled in the master program. There were 188 women and 48 men aged 18 to 47 years ($M=26.41$, $SD=6.19$).

Measures

A self-report questionnaire was developed to measure the psychological constructs relevant in the forethought phase. Several items were newly developed or if available they were adapted from existing instruments. The whole questionnaire including all items can be found in the Appendix. A definition of intercultural competence was provided before participants were asked to answer the items: *Below we ask you some questions regarding your intercultural competence. Please think how you perceive yourself right now. The term "intercultural competence" can have different meanings for different people. In order to make it easier for you to answer the questions below, we provide you with a definition. Intercultural competence means that one's own knowledge, feelings and actions are focused to act appropriately in intercultural situations.*

We omitted the term "effectively" in this definition because being effective is something very ambivalent in social work. Social workers usually intervene in rather challenging situations where acting appropriately rather than acting effectively is usually considered more important. The answer options for all items were a six point scale ranging between 0 "I fully disagree", 1 "I disagree", 2 "I rather disagree", 3 "I rather agree", 4 "I agree", and 5 "I fully agree".

Intercultural goal setting. We hypothesized that learners set priorities in three different domains before acting in intercultural situations (Bolten, 2006; Erll & Gymnich, 2010; Ting-Toomey & Kurogi, 1998).

Knowledge domain. Based on the composite models of intercultural competence, seven new items were developed (see table 1), e.g. "To improve my intercultural competence, I set myself the goal to acquire a broad cultural and country-specific knowledge."

Attitude domain. Based on the composite models of intercultural competence, five new items were developed (see table 1), e.g. "To improve my intercultural competence, I set myself the goal to improve my ability to better understand others' feelings."

Communication domain. Based on the composite models of intercultural competence, four new items were developed (see table 1), e.g. "To improve my intercultural competence, I set myself the goal to improve my conflict resolution strategies."

Intercultural strategic planning. We hypothesized that learners strategically plan their intercultural learning in three different domains. Participants were asked the following question before they were presented with the items in the three domains: "Which procedures do you plan in order to improve your intercultural competence?"

Knowledge domain. Based on the composite models of intercultural competence, seven new items were developed (see table 1), e.g., "I plan strategically, how I can acquire a broad cultural – and country-specific knowledge."

Attitude domain. Based on the composite models of intercultural competence, five new items were developed (see table 1), e.g. "I plan strategically, how I can improve my ability to better understand others' feelings."

Communication domain. Based on the composite models of intercultural competence, four new items were developed (see table 1), e.g., "I plan strategically, how I can improve my conflict resolution strategies."

Intercultural self-efficacy describes the motivational believe in one's ability to reach intercultural goals, to continue an action and to put in some effort even if the circumstances are very challenging. Learners who have high levels of intercultural self-efficacy believe in their future successes and keep on trying even if they experience some drawbacks in intercultural situations. By modifying existing items (cp. Jerusalem & Satow, 1999), four items were newly developed (see table 1), e.g., "I can act interculturally competent even in difficult situations, if I make an effort."

Intercultural outcome expectations refer to belief that intercultural achievement is a changeable construct and one can improve his intercultural skills. Therefore four existing items (cp. Dweck, 1999; Schober, 2002) were adapted (see table 1), e.g., "It is not determined how interculturally competent I am; I can learn step by step and constantly improve myself."

Intercultural intrinsic interest is characterized by an unconditional and essential interest in the intercultural topic. Learners who have a high level of intercultural intrinsic interest think that developing their intercultural competence is an end in itself. By modifying existing items (cp. Schmitz, Perels, Bruder & Otto, 2003; Schiefele, Krapp, Wild & Winteler, 1993), four items were newly developed (see table 1), e.g., "My major goal is to improve my intercultural competence."

Intercultural learning goal orientation. Previous findings have consistently shown that learning goal orientation supports the self-regulatory process significantly better than an outcome goal orientation (cp. Dweck, 1999; Zimmerman, 2000a). We measured the intercultural learning goal orientation by three adapted items (cp. Dweck, 1999; Schober, 2002; see table 1), e.g., "My major goal is to improve my intercultural competence."

Data Analytical Strategy

All data analyses were carried out using Mplus 7. We computed measurement models (CFA's) to evaluate the construct validity of all constructs (Table 2), and a structural model on the factorial structure of the forethought phase (Figure 2). To evaluate the model fit three criteria were used: the chi-square test, the Comparative Fit Index (CFI; Bentler, 1990), and the root mean squared error of approximation (RMSEA; Steiger, 1990). Non-significant chi-square values indicate good model fit. However, because chi-square is known to be sensitive to sample size, CFI and RMSEA indices of fit were also important to examine. CFI ranges from 0 to 1.00 with values above 0.95 indicating good, values above 0.90 indicating adequate fit. RMSEA ranges from 0 to ∞ , with values below 0.05 indicating good, values below 0.08 indicating adequate fit. Maximum likelihood estimation using the MLR estimator of Mplus was implemented providing standard errors and test statistics that are robust to non-normality of the data and to non-independence of observations.

Results

Measurement Models

To establish the factor structure of all constructs, confirmatory factor analyses (CFA) were applied separately for each construct. As shown in table 1, all constructs showed satisfying construct validity (all CFA's > 0.90). Although the RMSEA's of two scales (outcome expectations, intrinsic interest) were higher than 0.08, no item was dropped for the subsequent analyses.

Table 1. Summary of the Confirmatory Factor Analyses

Variables	Items	α	Chi ²	df	p	CFI	RMSEA	SRMR
Forethought-Phase								
Intercultural learning goals – Knowledge domain	7	.72	24.38	11	.01	0.957	0.072	0.040
Intercultural learning goals – Attitude domain	5	.83	6.10	4	.19	0.995	0.047	0.020
Intercultural learning goals – Communication domain	4	.46	0.03	1	.88	1.000	0.000	0.002
Intercultural strategic planning – Knowledge domain	7	.80	17.96	11	.08	0.986	0.052	0.030
Intercultural strategic planning – Attitude domain	5	.87	7.37	4	.12	0.994	0.060	0.015
Intercultural strategic planning – Communication domain	4	.66	2.40	1	.12	0.991	0.077	0.020
Intercultural self-efficacy	4	.81	2.34	1	.13	0.996	0.075	0.011
Intercultural outcome expectations	4	.71	11.24	2	<.001	0.951	0.140	0.037
Intercultural intrinsic interest	4	.84	7.22	1	<.001	0.984	0.162	0.018
Intercultural learning goal orientation	3	.64	0.00	0	<.001	1.000	0.000	0.000

Structural Models

To construct the structural models, parcels (=scale means) were used. The means, standard deviations and bivariate correlations of all manifest variables are presented in table 2. Parcels are preferred for the consecutive analyses because, compared with items, parcels have superior psychometric quality that reduce both Type I and Type II sources of error but do not bias or otherwise inflate construct relations (for details see Little, 1997).

Table 2. Means, Standard Deviations, and Bivariate Correlations between the Study Variables

Constructs	M (SD) n=236	1	2	3	4	5	6	7	8	9
Intercultural learning goals – Knowledge domain (1)	3.84 (0.61)	-								
Intercultural learning goals – Attitude domain (2)	4.09 (0.71)	.48	-							
Intercultural learning goals – Communication domain (3)	3.67 (0.65)	.38	.42	-						
Intercultural strategic planning – Knowledge domain (4)	3.74 (0.72)	.71	.49	.33	-					
Intercultural strategic planning – Attitude domain (5)	3.98 (0.80)	.37	.78	.43	.57	-				
Intercultural strategic planning – Communication domain (6)	3.66 (0.76)	.32	.45	.77	.39	.54	-			
Intercultural self-efficacy (7)	3.45 (0.70)	.24	.12 ^{ns}	.20	.17	.08 ^{ns}	.20	-		
Intercultural outcome expectations (8)	4.38 (0.58)	.13 ^{ns}	.21	.13 ^{ns}	.13 ^{ns}	.13 ^{ns}	.13 ^{ns}	.05 ^{ns}	-	
Intercultural intrinsic interest (9)	3.89 (0.88)	.47	.44	.30	.45	.40	.30	.24	.37	-
Intercultural learning goal orientation (10)	3.70 (0.72)	.50	.47	.32	.52	.47	.30	.16	.23	.55

Note. All items range between 0 and 5. All bivariate correlations were statistically significant at $p < .01$ level, except the ones marked with ^{ns}.

In line with the theoretical model presented in figure 2, the *forethought phase* was constructed. The model consisted of two latent factors and four manifest factors and showed an excellent fit, $\chi^2(31) = 67.79$, $p < .01$, $CFI = .952$, $RMSEA = .072$. The three indicators of the two latent factors (goal setting & strategic planning) were allowed to correlate, because the items capture the same three intercultural domains and therefore their content domains are identical (see figure 3).

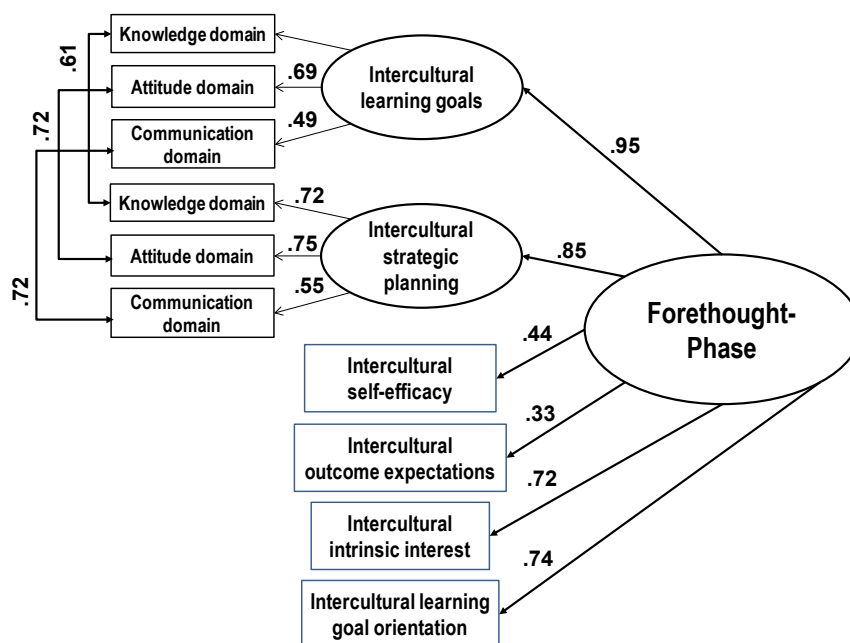

Figure 3. SEM Model: Empirical Structure of the Forethought-Phase (standardized estimates)

Discussion

Due to increased migration and mobility, intercultural competence has been becoming a key competence for many professions. To better understand the learning process of students in intercultural situations we developed a Process Model of Intercultural Competence (PICO-Model). Although many theoretical models of intercultural competence have been developed (cp. Spitzberg & Chanon, 2009), we are not aware of a model that conceptualized intercultural competence development from the perspective of self-regulated learning. Applying the self-regulated learning model by Zimmerman (2000a) a cyclical intercultural learning process was proposed. In this study, we investigated the first phase of the self-regulated learning process, the forethought phase. We hypothesized that an intercultural learning process is initiated when learners set themselves intercultural learning goals and plan their intercultural learning in three different domains (knowledge domain, attitude domain, communication domain) before acting in intercultural situations, when their intercultural self-efficacy, intercultural intrinsic interest, and, learning goal orientation are high and when they think that they can improve their intercultural skills (positive outcome expectations). To test these hypotheses we applied confirmatory factor analyses (CFA) separately for each construct. Based on cross-sectional data, the theoretical structure of the forethought phase was empirically validated.

Although all items were constructed relying on validated instruments and the structural validity of the new measures was rigorously tested, it should be kept in mind that self-assessments are only one possibility to investigate intercultural learning processes. Future studies could also collect data via learning diaries which could be completed before, during and after a series of specific real life intercultural situations. Alternatively, experimentally manipulated hypothetical vignettes could be applied. Both methods could be used to investigate the validity of the intercultural learning process across different intercultural situations and to examine the cyclical nature of self-regulated learning longitudinally. Moreover, replication studies with different target groups in other sub-cultures or other countries are recommended to rule out a possible ethnocentric bias inherent in the model.

Appendix

Intercultural learning goals – Knowledge domain

To improve my intercultural competence, I set myself the goal to ...

1. ...acquire a broad cultural- and country-specific knowledge
2. ...engage as intensively as possible with one particular culture

3. ...learn a new language
4. ...acquire knowledge about cultural differences
5. ...acquire knowledge about cultural similarities
6. ... become more aware of my attitudes towards my own culture
7. ...become more aware of my attitudes towards other cultures

Intercultural learning goals – Attitude domain

To improve my intercultural competence, I set myself the goal to ...

1. ...improve my ability to better understand others' feelings
2. ...increase my open-mindedness
3. ...deal better with inconsistencies
4. ...respect other people even more
5. ...not give in immediately in difficult intercultural situations

Intercultural learning goals – Communication domain

To improve my intercultural competence, I set myself the goal to ...

1. ...discuss the way I talk when difficulties in communication occur
2. ...address unpleasant topics indirectly, if it is appropriate in the situation
3. ...address unpleasant topics directly, if it is appropriate in the situation.
4. ...improve my conflict resolution strategies

Intercultural strategic planning – Knowledge domain

I plan strategically, how I can ...

1. ...acquire a broad cultural- and country-specific knowledge
2. ...engage as intensively as possible with one particular culture
3. ...learn a new language
4. ...acquire knowledge about cultural differences
5. ...acquire knowledge about cultural similarities
6. ... become more aware of my attitudes towards my own culture
7. ...become more aware of my attitudes towards other cultures

Intercultural strategic planning – Attitude domain

I plan strategically, how I can ...

1. ...improve my ability to better understand others' feelings
2. ...increase my open-mindedness
3. ...deal better with inconsistencies
4. ...respect other people even more
5. ...not give in immediately in difficult intercultural situations

Intercultural strategic planning – Communication domain

I plan strategically, how I can ...

1. ...discuss the way I talk when difficulties in communication occur
2. ...address unpleasant topics indirectly, if it is appropriate in the situation
3. ...address unpleasant topics directly, if it is appropriate in the situation.
4. ...improve my conflict resolution strategies

Intercultural self-efficacy

1. I can act interculturally competent also in difficult situations, if I make an effort.
2. It is easy for me to act interculturally competent in new situations.
3. Even when situations seem to be difficult at first sight, I still know that I can act interculturally competent, if I think through the situation properly.
4. I know that I can cope with challenges of an intercultural situation.

Intercultural outcome expectations

1. I am not very talented to act interculturally competent and I cannot really change that. (recoded)
2. Although I can learn new contents, I lack the talent to really understand how to act interculturally competent. (recoded)
3. It is not determined how interculturally competent I am; I can learn systematically and constantly improve myself.
4. I can improve my skills to act interculturally competent.

Intercultural intrinsic interest

1. It is important for me to act interculturally competent.

2. Intercultural competence is actually not important for me. (recoded)
3. Engagement with intercultural competence not one of my favourite activities. (recoded)
4. It is a pleasure for me to think and talk about how to act interculturally competent.

Intercultural learning goal orientation

1. My major goal is to improve my intercultural competence.
2. I feel to be successful when I get new ideas how to act interculturally competent in specific situations.
3. Regarding intercultural competence, my major goal is to learn many new things.

Professional Skills Development Of Rural Tourism Enterprises In The Baltic Sea Countries

Abstract

Nowadays, tourism industry is significantly influenced by geopolitical processes. Due to the growing concerns of geopolitical instability, tourism flow to many so far very popular tourism destinations in Europe has significantly decreased. Changes in lifestyle also play an important role. There is an increasing demand for peaceful countryside idyll, bird watching, trying local specialties and participation in traditional arts and crafts workshops, which are just a few of activities that foreign guest wish to experience during their international travel tour, thus giving preference to visit the countries of Central Baltic Sea area – Latvia, Estonia and Finland – instead of many other attractive European travel destinations. Nevertheless, even as a region, the Central Baltic Sea countries are still quite unknown on the global tourism scale. Therefore, sustainable and well trained enterprise clusters with skills, knowledge and understanding how to enter new challenging markets such as Japan are required in the three Baltic Sea countries. Although the flow of Japanese tourists is annually increasing to Latvia, Estonia and Finland, specific knowledge and joint strategy to enhance cooperation with Japanese tourist agents are also necessary. Although rural tourism has a huge potential owing to specific natural and heritage culture potential in this region, most rural tourism enterprises here are small lifestyle farms and thus lack specific knowledge and market intelligence how to deal with cultural differences. In 2016, a new ambitious INTERREG Central Baltic project CAITO “Meta cluster for attracting Japanese tourism market” was commenced with active participation of the three countries of the Baltic Sea region. The overall objective of this project is to promote and support Latvian, Estonian and Finnish rural tourism enterprises to enhance cooperation with Japanese tourism market by strengthening capacity, mutual collaboration and tourism stakeholders’ coordination in the three Baltic Sea countries. The aim of the current research is to present the data obtained in scope of the project activities in particular focusing on marketing skills’ training. The specific research tasks are: 1) to characterize the attractiveness of the Baltic Sea region rural tourism product offered for Japanese tourists; 2) to analyse the needs of Japanese tourists in the Baltic Sea region countries and characterize the most typical market segments; 3) to identify current gaps in the public transport availability for Japanese travellers in rural areas of Latvia; 4) develop proposals for local entrepreneurs’ skills development to improve current rural tourism products and their marketing communication according to Japanese travellers’ expectations. The research employed monographic, desk study, statistical analysis, comparative analysis and in-depth interviews with rural entrepreneurs in Latvia.

Introduction

Asian tourism has been seen as a new potential growth market for Finland and the Baltic States for some time, and several national and regional tourism strategies count on this market. In previous years, Asian visitors have generally focused on the main tourist attractions and capital cities, but new products have attracted more interest in this market, in line with the worldwide trends in health, wellness and the natural environment. This creates new opportunities, especially for rural tourism, but not without its challenges. Rural tourism provision must meet Asian customers’ needs and demands, which may be sometimes problematic for the existing products. Therefore, to fully exploit this potential new market, companies often need to undertake development activities. This, in turn, assumes that businesses have knowledge of the behaviour of Asian tourists (Japanese tourists in..., 2016, p.5).

Today, the tourism industry in the Baltic Sea region contributes significantly to the economies of the countries in the region. However, the tourism industry in the Baltic Sea region, especially rural tourism that complies with sustainable development principles, needs a strong enhancement both on regional and European level addressing the opportunities and challenges of the industry. Politicians often underestimate the importance and impact of rural tourism on the overall economy and regional development of the countries. Target-oriented enhancement of rural tourism industry would help to eliminate regional disparities and create work places in remote rural areas, which is a particularly serious problem in Latvia and Estonia (Grinberga-Zalite et.al., 2017).

In 2016, a group of university scientists and representatives of rural tourism associations from Latvia, Estonia and Finland started INTERREG Central Baltic project CAITO “Meta cluster for attracting Japanese tourism market”. The project provides extensive cooperation in research and practical activities in Latvia, Estonia, southern part of Finland, and Japan. The overall objectives of the project are: to promote and support rural tourism companies to

enter Japanese tourism market by strengthening their capacity and cooperation in the three Baltic Sea countries. Specific objectives of the project are aimed at the following activities:

- 1) to explore the Japanese tourism market and the requirements for rural tourism in the Baltic Sea countries;
- 2) to develop a guide for rural tourism service providers about Japanese tourists' expectations and desires;
- 3) to organize training seminars for the rural tourism product providers about tourism product development opportunities aimed at Japanese tourism target market;
- 4) to promote rural tourism products for Japanese tourists in tourism fairs; elaborate and disseminate promotion materials and brochures; attract social media and bloggers, thus introducing Japanese tourism operators and media with rural tourism opportunities in Latvia, Estonia and Finland as well as developing a catalogue for tourism operators in Japan accordingly bringing together the proposed rural tourism products;
- 5) to organize decision makers' forums to identify existing problems that hinder, hamper and restrict Japanese tourists' wish to travel around Latvia, Estonia and Finland, as well as to find their solutions.

This will result in strengthened cooperation among the three countries' rural tourism enterprises, tour operators and travel agencies by reducing or preventing the potential risks and barriers to the Japanese tourists' visits, thus improving rural tourism products to attract larger number of tourists from Japan.

The project partners are Estonian University of Life Sciences (lead partner); Latvia University of Life Sciences and Technologies; Laurea University of Applied Sciences; University of Helsinki, Ruralia Institute; Latvian Country Tourism Association "Lauku celotajs"; Estonian Rural Tourism Association; Regional Tourism Association in Southern Finland "Visit South Coast Finland". The total budget of the project is 1 412 734.71 EUR, of which 85% is co-financed by the European Regional Development Fund.

The aim of the current research is to present the data obtained in the second phase of the project (2017-2018) revealing the latest trends regarding Japanese traveller attraction to the Baltic Sea countries and developing training programmes for rural tourism enterprises in the Baltic Sea Countries. The specific research tasks were: 1) to characterize the attractiveness of the Baltic Sea region rural tourism product offered for Japanese tourists; 2) to analyse the needs of Japanese tourists in the Baltic Sea region countries and characterize the most typical market segments; 3) to identify current gaps in the public transport availability for Japanese travellers in rural areas of Latvia; 4) develop proposals for local entrepreneurs' skills development to improve current rural tourism products and their marketing communication according to Japanese travellers' expectations. The current research is a continuation of the data analysis conducted within the initial phase of the project that is supplemented by the latest facts obtained within desk study, statistical analysis, comparative analysis and in-depth interviews with rural entrepreneurs in Latvia.

Increasing Interest Of Japanese Tourists In Rural Tourism And The Baltic Sea Countries

Compared to Central Europe and Western Europe, the Baltic Sea region is comparatively safer for tourism. Estonia, Latvia and Finland so far have not experienced natural disasters, war, strikes, or big events where people may act violently – these aspects are important. People are friendly but not pushy, which Japanese visitors appreciate. Shopping can be done without haggling, unlike in many Eastern countries. Availability of unspoiled nature landscapes, rich cultural heritage and high quality accommodation services and direct flights are highly important factors for Japanese tourists while taking decision of tourism destinations. Owing to direct flights from the largest Japanese cities to Helsinki provided by Finnair, there is an increasing trend of Japanese tourists arrival to all the three Baltic Sea Countries as due to long distances and high costs (travel to Europe costs ~4000EUR), 67% of Japanese tourists usually plan to visit more than just one country.

From marketing view point, travelling is satisfaction of hedonic needs and personal enrichment (self-actualization). The research data that were acquired by Latvian Country Association "Lauku celotajs" in 2016 from rural tourism guest houses and lifestyle farmers who had provided accommodation services for Japanese tourists give evidence that shopping and attending of crowded and polluted cities is not appealing for Japanese savvy tourists any more. Today they are rather looking for sophisticated personal enrichment activities, which are not shopping. Accordingly, popular tourism attractions offering very predictable and mainstream products many-to-many, which lately are losing their topicality compared to highly personalized and exclusive rural tourism niche products.

Fig. 1. **Most popular activities of Japanese tourists during rural tourism visits in Latvia, %**

Source: Latvian Country Association in-depth interviews with rural tourism service providers, n=34

Figure 1 reveals that peaceful countryside idyll, bird watching, trying local specialities and participation in traditional arts and crafts workshops are activities that foreign guests wish to experience, thus giving preference to visit the countries of Central Baltic Sea instead of many other attractive travel destinations. The analysis of aggregated data suggests that the most typical Japanese tourists' market segment in the Baltic Sea countries is senior couples (60+) who can be characterized as savvy seniors. For them, visiting the Baltic Sea countries is "must-see-in life" intention as they have already been almost in all most popular European tourism destinations, while the Baltics region only lately has become affordable destination for them owing to direct flights to Helsinki. Another important segment is males (40-50) who have business connections in the Baltics. Although business travel is their main priority, still politeness often requires from them to be informed of their business partners' country historical and cultural heritage. And finally, according to in-depth interviews with rural entrepreneurs in Latvia, the number of young Japanese women (20-30), so called "culture oriented girls" is also rapidly growing and is regarded as a very attractive market segment for rural tourism product. These female tourists are looking for sophisticated culture experience and interaction with unspoilt nature (organic, eco, raw etc.).

In authors' opinion, rural tourism has a wide variety of activities to offer for all the three market segments as all of them are both deliberately and unknowingly looking for "feel good" products, i.e. products that make the world a better place. Accordingly, collective intelligence (e.g. accumulating knowledge of collection and proper use of organic medicinal herbs), enhancing of animal welfare (responsible and caring animal husbandry), cultivation of environmentally friendly products, cooking technologies of healthy food as well as producing products that enhance society's integration (e.g. by employing blind people on the farm thus helping them to socialize and create something useful).

Rural Entrepreneurs' Professional Skills To Be Improved In Scope Of Marketing Mix Elements

According to marketing theory assumptions (Kotler & Keller, 2007; Simkova (2010)), there are eight marketing mix elements in tourism: product, price, place/distribution, promotion, people, packaging, programming and partnership, which all need to be well balanced and regularly updated in line with customers' needs. In the current research, the authors have analysed the gaps in Latvian rural tourism product within the above mentioned eight rural tourism marketing mix elements to identify areas for rural entrepreneurs' skills improvement, which will be integrated in specially tailored courses/seminars/guide-books developed in scope of CAITO project activities.

Place

To find out the viewpoints of foreign guests in the above mentioned countries regarding their experience of traveling by public transport, the partners of INTERREG Central Baltic Sea "CAITO – Meta cluster for attracting the Japanese tourism market" project group conducted structured interviews with a wide range of rural tourism stakeholders.

Tourists who have visited Latvia, Estonia and Finland admit that in the cities public transport system is good, various modes of public transport are optimally integrated to meet the needs of passengers. However, in remote rural areas the situation is not as optimistic – there is a need for more frequent trains/buses, and timetables of various modes of transport often are not integrated in a single system thus causing problems with travel planning. As tourists often wish to see as many sightseeing objects of one area as possible, it is highly important to have a well-planned route, which efficiently combines several modes of transport. Research results show that currently there are just a few internet sites available where travellers can obtain information about all transport services' providers, as each transport enterprise mainly provides information only about its own routes, thus travellers often have problems to combine routes of two or more different transport service providers. Moreover, buying tickets is another challenge as, unlike in most of cities, in rural areas traffic time-tables (directions, departure/arrival times) are available only in official language but not in English. A significant problem for travellers in Latvia is that, in

accordance with the Latvian State Language Law (Article 21 of the State Language Law), all information that is intended for the public and provided by state or local government institutions must be in Latvian only with a few exceptions (for example, information in international transport centres). In this respect, the authors conclude that currently it is very important to improve Latvian rural entrepreneurs' awareness of their duty to be ready to explain (in English language or in a pre-prepared written material) directions to Japanese tourists as well as convince them that without their assistance Japanese tourists can be exposed to serious risks (e.g. get lost, get a penalty for using public transport without appropriate ticket).

Product

Careful planning of a travel is highly important as paid vacation in Japan is only 10 days, thus all activities on the farm have to be precisely scheduled. The understanding of the most appropriate time for travelling for Japanese tourists is also necessary. Often Latvian rural entrepreneurs consider that Japanese tourists can be treated in the same way as other European tourists; however, it is not true. Unlike other European travellers, Japanese tourists are interested in travelling in autumn (September and October). Thus, this fact may extend the season, which is very important for Latvian rural enterprises. Moreover, most of all rural tourists from Japan value nature, landscape and the aurora borealis and they might also be modern humanists (experienced tourists) seeking experiences in exotic and unspoilt nature (forests, sauna, snow, walking on the ice) with local people.

Price

According to in-depth interviews, conducted in scope of the project activities, the average cost of European journey for a Japanese traveller consists of approximately 4000 EUR, which is expensive travel compared with other closer tourism destinations (Australia, South Korea), thus the high price must have appropriate justification (ability to visit several North Europe countries during the stay in Baltics, enjoy regional importance cultural events; ability to learn new specific methods of sustainable cooking, gardening etc.).

Promotion

The lack of Japanese web pages, Facebook pages and marketing material is a problem, especially in Latvia. This reduces visibility and awareness of rural tourism enterprises and travel packages. Moreover, for young generations Instagram is recommended. The authors' in-depth interviews with rural entrepreneurs revealed that lack of skills necessary for conducting digital marketing activities is one of most problematic aspects. Rural entrepreneurs are very interested to master these skills; however, digital marketing courses in Latvia currently are very demanded and thus too expensive for small life style farmers.

People

Rural tourism is definitely people-to people business. Therefore, interaction with customers is highly important and necessary. As many guest houses are run by lifestyle farmers who often are retired and thus are less motivated to improve their English language speaking skills to such extent as to be able to conduct practical workshops (e.g. cooking a traditional meal). Therefore, in scope of the project activities rural entrepreneurs should receive a special training material with most common conversation themes in English language, which could be easily mastered by everyone and used in everyday situations.

Packaging and partnership

These marketing mix elements, especially the element "partnership" are relatively new in marketing theory (Kotler & Keller, 2014); thus small local businesses are not fully aware of their necessity. Packaging tool can be understood as building of service packages, i.e. combining various products and services for which customers pay a total price so as to exactly match their wishes and requirements. A combination of related and complementary services forms a complex offer with which is very closely associated a content specification of programmes (programming) intended for various types of clients (different market segments). Creating service packages associated with specialized programmes is the most distinct tendency influencing the current development of tourism, including rural tourism (Pourova, 1999). If a customer buys rural tourism product package, it means that it is a set of several benefits – picking-up at the airport, shuttle services, reservation of a workshop activity, arrangement of an inter-city tour etc.). Therefore, rural entrepreneurs should be prepared to actively cooperate with other service providers, often their direct and indirect competitors, to provide the most appropriate and affordable in price set of activities to be offered for Japanese tourists. Very often small rural enterprises underestimate the benefits of being a member of a network (association, cluster, suppliers' organizations) as it initially seems as additional costs in the form of commission, membership etc. However, the new economy is a network economy (Rifkin, 2001), thus even members of such small sub-industries as rural tourism have to cooperate and look for opportunities how to build win-win relations with their direct and indirect competitors, suppliers and customer organizations. Consequently, partnership element is topical, too. In addition to the above said, rural tourism product is a "feel good product", which in the era of sustainable development is a product that can make the world a better place by promoting a healthy lifestyle, taking care of nature and animal welfare, cultivating healthy and locally grown food. However, in order to survive in the countryside, local businesses cannot implement same business strategies as large companies located in urban areas where businesses do not have seasonal character and

workforce availability is not a serious problem. Therefore, often partnerships with social entrepreneurs and NGOs can significantly support and enhance the success of the product offered by a small rural entrepreneur (Donovan & Henley, 2010). There are many good examples how rural entrepreneurs have become social entrepreneurs and built original and target oriented win-win partnerships with seniors' organizations, new mothers, disabled people etc., which consequently have added a unique social value to their product, thus making it much more attractive for customers who want to buy "feel-good" product instead of a mainstream commercial one giving only a short instant gratification.

Conclusions

The data obtained in Latvia, Estonia and Finland during the initial phase of the INTERREG Central Baltic project CAITO "Meta cluster for attracting Japanese tourism market" show that enhancing of cooperation among Finnish, Estonian and Latvian rural tourism agencies is of high importance in the interests of all the three Baltic Sea region countries both in terms of financial investments in rural tourism industry development and in information exchange. Enhancing of cooperation with Latvian Country Association and network of rural enterprises could enable Japanese tourists to enjoy even safer, more meaningful and diverse travel experience in the Baltics.

The next objectives of the CAITO project should be focused on conducting specially tailored training courses for rural tourism companies to better meet the needs of Japanese tourists. The most topical aspects that need to be integrated in these trainings are: digital marketing for small enterprises; English basics for hospitality industry; product development and market positioning for rural tourism enterprises as well as building networks within the industry. For this reason, project partners have to elaborate a special guide-book devoted to specifics of Japanese tourism market and recommendations for improvement of sustainable tourism products, which initially needs to be approved in each of the project countries to identify potential gaps in its content and afterwards should be prepared and distributed to rural entrepreneurs working with Japanese tourists in Latvia, Estonia and Finland.

Esin Erdinç

Afyon Kocatepe Üniversitesi 3.Sınıf Tıp Fakültesi Öğrencisi

Özet

Amaç

Afyon Kocatepe Üniversitesi Tıp Fakültesi öğrencilerinin Proje Uygulama Çalışması dersine ait öz-yeterlik düzeylerini belirlemek ve bu ders ile Bilimsel Araştırma Metotları dersine ait tutumları arasındaki ilişkiyi ortaya çıkarmak araştırmanın temel amaçlarını oluşturmaktadır. Ayrıca incelenen konu üzerinde etkili olabileceği düşünülen çeşitli etkenler ile öğrencilerin Proje Uygulama Çalışması dersine ait bakış açıları belirlenmeye çalışılmıştır.

Anahtar kelimeler: Öz-yeterlik, Bilimsel Araştırma Metotları, Yapısal Eşitlik Modellemesi

Gereç ve Yöntem

Araştırmanın toplumunu Afyon Kocatepe Üniversitesi Tıp Fakültesi 4., 5. ve 6. Sınıf öğrencileri, örneklemini ise 2017-2018 akademik yılı güz döneminde eğitim-öğretim görmekte olan, Proje Uygulama Çalışması dersini alan ve çalışmaya katılmak isteyen öğrenciler oluşturmaktadır. Öğrencilerin öz-yeterlik düzeylerini belirlemek amacıyla Bilimsel Araştırma Öz-yeterlik ölçeği ve Bilimsel Araştırma Metotları dersine yönelik tutum ölçeği kullanıldı. Verilerin değerlendirilmesinde ise Student-t testi, Mann-Whitney U testi ve Yapısal Eşitlik Modellemesi kullanıldı. İstatistiksel anlamlılık için $p < 0.05$ değeri kabul edildi. Verilerin değerlendirilmesinde SPSS (version 20) paket programı ve AMOS (21.0) kullanıldı.

Bulgular

Araştırmaya yaş ortalaması 22.63 ± 1.5 olan toplam 155 öğrenci (75 erkek, 80 kız) katıldı. Öğrencilerin %33.5'i bu derste en önemli amaçlarının bilimsel bir araştırma yapmak olduğunu ve %64.5'i ise Bilimsel Araştırma Metotları dersinin proje uygulama çalışması dersine faydalı olduğunu ifade etmişlerdir. Bilimsel Araştırma Metotları dersinin faydalı olduğunu düşünen öğrencilerin öz-yeterlik puanları diğer öğrencilere göre anlamlı derecede yüksektir ($p < 0.05$). Bilimsel Araştırma Metotları dersinin Proje Uygulama Çalışması dersine faydalı olduğunu düşünen öğrenciler; bilimsel araştırmanın önemi, bilişsel özgüveni (başarabilme gücü), olumlu tutumu (araştırmaya yönelik) ve günlük yaşantı - mesleki ilişki alt boyutlarına ait puanları diğer öğrencilere göre anlamlı derecede daha yüksektir ($p < 0.05$).

BAM ölçeği ile Öz-yeterlik ölçeği arasındaki test edilen Yapısal Eşitlik Modeli anlamlı bulunmuştur. BAM ölçeği öz-yeterlik ölçeğini yüksek düzeyde açıklamaktadır.

Sonuç

Bilimsel Araştırma Metotları dersine karşı ilgili olan, araştırmanın öneminin farkına varan ve olumlu bakan, bu dersi başarabilme gücü olan ve günlük yaşantısı ile ilişkilendiren öğrencilerin Proje Uygulama Çalışması dersine ait öz-yeterlikleri daha yüksek olduğu gözlenmiştir. Dolayısıyla, öğrencilere Bilimsel Araştırma Metotları dersinin önemini vurgulayarak bu derse olan ilgilerini artırarak bilimsel kültüre yönelik pozitif duruş sergileyen öğrencilerin yetiştirilebilmesine katkı sağlayacağı düşünülmektedir.

Promoting Active Learning Through Group Based Assessment Mixing Low And High Achievers In Group-Based Quizzes

Sherif El-Wageeh
Kingdom University
sherifwageeh@yahoo.com

Abstract

The shift in the educational concepts from “teacher-centred education” to “student-centred education” led to the necessity of re-assessing teaching, learning and assessment strategies used in education. Active learning strategies are examples of the conceptual shift in education. Group based assessments are examples of active learning strategies that are believed to support this change in educational ideologies.

This study highlights the concept of active learning and group-based assessment through an experience of applying two different methods of group-based quizzes on fourth year students of architectural engineering program. The two methods are: quiz bowl, and sit group quiz. The study also tries to track the effect of the selected quiz methods on students’ academic progress through their performance in these group assessments as well as in the individual assessments. The output of this experience is compared to previous semesters in which only individual assessment strategies were applied. It is found that incorporating group based quizzes helps in boosting the academic progress of low achievers, and reducing the gap between low and high achievers.

Keywords: *Active learning; Learner-centered education; group-based quiz; quiz bowl; sit group quiz; low achievers; peer learning; student’s academic progress; Small Group Learning (SGL).*

Introduction

Context And Background

The change in educational concepts from a teacher-centred approach to a student-centred one has set the issue of class management as a continuous challenge facing teachers. Many studies have focused on this change in education and its effect on teaching, learning and assessment strategies as the corner stone in how the class is managed, and how the course is communicated to the students. The student-centred approach engages students in the education process and converts them from passive receivers of information set by the instructor into active learners. Many studies highlight the integration between teaching, learning and assessment (Gaudet et al., 2010; Simms and George, 2014; Carless, 2015). Gaudet et al. (2010) believe that Small Group Learning (SGL) may represent one of the most accessible methods for converting a classroom from a teacher-centred setting to an active learner-centred environment (p. 1). Mixed teaching approach, student’s involvement in education, peer learning, and group-based assessment are among many concepts that have been researched. Johnson et al. (1998) (as cited in Gaudet, et al., 2010, p. 8) compiled results from 305 studies on cooperative, competitive, and individualistic learning since 1924, and found that cooperative techniques were substantially better at promoting learning compared to the other two approaches.

This paper focuses on group-based quizzes as an example of group-based assessment strategies that are currently under research focus. The researcher tries to track the effect of such strategies on students’ academic progress. An experiment was conducted on third year students of architectural engineering during the course “introduction to project management” in one semester. The researcher designed two different types of group-based quizzes. The students were given one quiz before the midterm exam and the other one after the midterm exam. The students’ groups were a mixture of high and low achievers in order to make a balance between the groups on one hand, and to depict the mutual effect between them on the other hand. Students’ progress in previous semesters, in which only individual assessment strategies were applied, was analyzed as well in order to compare between the effect of both group-based and individual assessment strategies on students’ progress in general and low achievers progress in specific.

Motivation and Importance The significance of this research is motivated by the challenge of transforming teaching and learning process into an interactive process that enhances student’s active participation and involvement in the class. The researcher tried to apply some changes to the conventional assessment strategies in the course “introduction to project management” and to test the effect of such strategies on the students’ attitude and academic progress. It was easily noticed how the mood of the class has dramatically changed during the application of the new assessment strategies.

The importance of this study stems from the shift in the educational process from a teacher-centred approach to a student-centred approach. This shift is reflected on the concept of learning outcomes. In the past, learning outcomes of the academic programs and courses were limited to knowledge, understanding and subject specific skills. Nowadays, it is important to incorporate additional skills and competencies in the design of any course. General and transferable skills, such as practicing leadership and the ability to work effectively in a team are

examples of skills that should be developed and practiced in the design of any course. Applying group-based assessment is believed to reinforce such skills and competencies.

Academic progress of students in general and low achieving students in specific is another important issue related to this study. Many studies have focused on highlighting the problem of students with low GPA (low achievers) from different points of view (Mahenthiran and Rouse, 2000; Gaudet et al., 2010; Jabeen and Khan, 2013). Jabeen and Khan (2013) conducted a survey to compare between some attributes related to learning motivation in low and high achievers. They found that 'high achievers have high 'ego-ideal' (and) are self confident (and) competitive' while 'low achievers possess low ego-ideal, hardly bother to have a high position or status, (and) are not competitive' (p. 227). The experiment implemented in the current study demonstrates an attempt to merge low achieving students with high achieving ones in group-based assessment strategies, and to measure the effect on academic performance and progress of low-achievers.

Research Question

The paper attempts to discuss how group-based assessment can promote in-class active learning and academic progress of low achieving students in the course. An experiment is designed to test the effect of using two types of group-based quizzes (quiz bowl and sit group quiz) on the student's satisfaction and academic progress. In order to validate the experiment, the researcher analyzed students' academic progress in previous academic semesters in which only individual assessment strategies were applied.

Following are the two questions that the research tries to answer:

- Do group quizzes promote low achievers academic progress?
- Do group quizzes reduce the gap between low achievers and high achievers?

Research Objectives

The research aims at:

1. Highlighting the conceptual shift in higher education and its effect on collaborative and active learning.
2. Highlighting group-based quiz as an example of group-based assessment strategies.
3. Experimenting the effect of using group-based assessment on academic progress.
- 4.

Research Structure

The research is structured on six sections. The first section introduces the topic's context and background as well as the motivation behind conducting the research and its importance. The research question is also highlighted in this section. The second section underlines the shift in the educational concept from a teacher-centred approach to a student-centred approach, and its reflection on active and collaborative learning. The third section focuses on group-based assessment strategies, and their relationship with active and collaborative learning. The fourth section presents the experimental study of using group-based quizzes through highlighting experiment objectives, methodology, planning, implementation and results. The fifth section includes a discussion about the experiment results, limitations and implications. The sixth section contains the conclusion, recommendations and directions for further research.

Active And Collaborative Learning

This part of the study presents a theoretical background that covers some concepts related to the experimental study context with reflections on the conceptual shift of education from teacher-centred approach to student-centred approach. It underscores the definition, origin, features and benefits of two concepts related to education: active learning and collaborative learning.

Active Learning: A change in concept

Research indicates that the focus in the classroom should shift from the instructor to the student (Khalid and Nuhfer-Halten, 2012, p.1). Learning is an active endeavour that requires an effort and motivation from the learner in order to be able to understand, memorise, analyse, and synthesise what s/he received. Many studies have focused on active learning strategy (Meyers, 1993; Barr, 2011; Domenech et al., 2015; Khalid and Nuhfer-Halten, 2012; Hryciw and Dantas, 2016). Carefully designed assessments play a vital role in promoting active learning. Domenech et al. (2015) believe that 'it is of paramount importance to design assessment methods that properly motivate students to learn' (P. 154). In their study about active learning in polytechnic universities, Khalid and Nuhfer-Halten (2012) indicate that 'it is observed that tools like using props, making connections with past, and quiz bowl keep students interested and involved' (P. 1). Hryciw and Dantas (2016) found that 'scaffolded learning using active learning-lectures, small-group discussions and collaborative workshops, may enable students to develop their experimental design skills, but more importantly can be used to develop written scientific skills' (P. 1). Active learning is affected by the type of students' response to in-class assessment. Barr (2014) compared between using clickers and raising hand as a response method to questions answered during class. Statistical results

in her experiment demonstrate a significant difference both in participation and in comprehension with the different response methods (P. 317)

Active learning 'derives from two basic assumptions: (1) that learning is by nature an active endeavour and (2) that different people learn in different ways' (Meyers, 1993). Barr (2014) states that 'participation in the classroom has been shown to have a positive impact on cognitive, meta-cognitive, and affective learning' (P. 309). Group-based learning reinforces active learning because each student in the group will gain an experience from the learning styles of his/her peers. This experience helps in motivating students in a sense that each one will try to acquire a certain role in the process. Motivation of each individual in a group will not be the same by default. This is because interpersonal skills differ from one student to another.

Collaborative Learning: A Conceptual Shift

Collaborative Learning, sometimes called "cooperative learning", is a "mature concept with a solid research base accumulated over several decades". Cooperative learning is defined as 'students' collaboration to maximise their own and each other's learning, which is characterised primarily by group interdependence and individual accountability' (Dudley *et al.*, 1997; Johnson *et al.*, 1993 as cited in Mahenthiran and Rouse, 2000, p. 255). Studies have found out that in order for Cooperative learning strategies to lead to significant results, two components should be taken into consideration. The first component is promoting interdependence within groups, whereas the second component is holding students individually accountable for demonstrating their understanding of the material (Walters, 2000, p. 1). Yokomoto & Ware (n.d.) refer to two difficulties often reported by instructors when they use collaborative learning techniques in the class. The first difficulty is related to encouraging student acceptance of active learning, the second difficulty is to change the instructor's role from lecturer to facilitator. The instructor should design the scenario of collaborative learning in a way that demonstrates clearly the role of each student in the learning process. Moreover, assessment criteria associated with collaborative learning activities should combine assessing individual efforts, interpersonal skills and overall output of the group.

Walters (2000) believes that 'cooperative learning encourages social and interpersonal development as students learn how to work together and to appreciate diversity' (p. 3). Gaudet *et al.* (2010) state that Small Group Learning (SGL) can help in achieving effective teaching of science courses (p. 1). Through experimenting the effect of SGL, they found out that 'when students were given the opportunity to work on a quiz in pairs, the atmosphere in the classroom changed dramatically from solemn and serious to spirited and engaged' (p. 2). When asking students about the limitations of SGL, Gaudet *et al.* (2010) recorded minor issues related to coordinating schedules, managing time in class, disparate motivation and communication (p. 6). Kefale (2015) points to human and non-human constraints facing the implementation of cooperative learning. He refers to non-human factors such as class size, physical environment, shortage of instructional material and organisation of curriculum material (PP. 21-25). On the other hand, a meta-analysis, conducted by Springer *et al.* (1999), indicates that SGL improved academic achievement and reduced attrition in undergraduate science, math, engineering, and technology courses (as cited in Gaudet, *et al.*, 2010, p. 1). Discussion with peers can lead to the development of a new concept of understanding, so that students can answer conceptual questions better as individuals than they do prior to the group work (Smith (2009) as cited in Gaudet *et al.*, 2010, p. 8). A study conducted by Dohaney *et al.* (2012) tested the effect of collaborative learning on students learning gain. They found out that the learning gain of groups is systematically greater than the learning gain of individuals.

Group-Based Assessment: An Active Learning Strategy

Group-based quizzes are studied as an example of group-based assessment strategies, and then experimented in the next section of the study. In addition, this section highlights the concept of students' academic progress through the course, as one of the research objectives is to depict the effect of group-based assessment on students' academic progress in general and low-achieving students in specific.

Group-based Quizzes

Many experimental studies have been conducted to compare between collaborative group-based quizzes and individual quizzes. Giuliadori *et al.* (2009) examined the behaviour of both low performing and high performing students in group testing through physiology course. They tried to investigate whether students with individual correct answers change their answers when repeating the same experience in a group testing setting. Moreover, they tried to monitor the mutual effect between low and high performing (achieving) students. (p. 24)

Yokomoto & Ware (n.d.) highlight some benefits of the use of group-based quizzes in collaborative learning sitting. These benefits are, but not limited to, assisting in the development of course's instructional materials that can positively reflect on the learning process, training students to develop their learning skills, promoting active learning and interaction among students, and reducing students' anxiety with quizzes. Yokomoto & Ware (n.d.) advise instructors to include instructions that improve student's critical thinking and problem solving skills when designing a group-based quiz.

Yokomoto & Ware (n.d.) experience three variations related to the discussion time offered for students in case of group quizzes. The first variation is to allow students' discussion on certain principles related to the quiz topic before reading the quiz; the second variation is to allow students' discussion within 2 to 3 minutes after reading the quiz; the third variation is to allow students' discussion on certain principles related to the quiz topic before sitting for individual quizzes. Yokomoto & Ware (n.d.) conclude features of successful group quiz design. They clarify that it is important not to allow students to write anything during the discussion period in order to leave a space for students' brain storming process; it is advised that only one student from the group to write the solution whereas other members actively participate in the group; it is advised to adopt harder grading scheme that assures fairness in judging students' achievement and to prevent the group from just leaving the work to the best student; it is important to focus on basic principles of the subject rather than memorization; and finally students should be given any information that would be difficult to recall under the stress accompanying quizzes.

In their experiment on group-based quizzes, Gaudet *et al.* (2010) found out that course and quiz design seemed to encourage group discussion and debate about potential answers before writing down a single answer for the group. However, they recorded minor disadvantages as 'some students reported anxiety associated with the quizzes. Some students could not participate confidently in group discussions because they did not have time to read the quiz questions before a group member jumped in with an answer' (p. 2). These results imply that the instructor should prepare some instructions that regulate the quiz implementation in an organised way. In addition, he should present necessary basic information that may help students in their response to the quiz.

Quiz bowl is an example of group-based quizzes. Khalid and Nuhfer-Halten (2012) explain that quiz bowl is an 'enjoyable, educational technique that uses a game format derived from the TV show *College Bowl*, the quiz bowl questions are based entirely on one subject, typically the subject covered in the previous lecture'. They add that one of the distinctive features of quiz bowl method is that the instructor's role shifts to a facilitator. He "helps them relax, laugh at their own mistakes, and get caught up in the contagious spirit of the game" (p. 5)

Effect on Students' Academic Progress

Some studies have been conducted to measure the effect of group-based quizzes on students' academic progress through the course, which can be measured through student's marks in sit exams. Yokomoto & Ware (n.d.) found that both group quizzes and individual quizzes demonstrate correlation coefficients with semester exam averages that are significantly different from zero.

Mahenthiran and Rouse (2000) revealed that students can be grouped in a variety of ways such as by gender, grade point average (GPA), or majors. They noted that random grouping of students can lead to positive results if the group has a good attitude towards work. On the other hand, it may lead to negative results if the group has low ability (p. 257). They believe that teachers should intervene to balance the groups in a way that each group consists of high and low ability students (p. 259). The experiment conducted in the current study follows this model of mixed students' groups.

When Gaudet *et al.* (2010) tested the effect of experiment about group-based quizzes on high achieving students; they found that they benefited from the 'explanations provided by their peers in Small-group setting' (p. 6). On the other hand, it was found that low-achieving students developed 'a better conceptual understanding of material over the term' (p. 8). These findings imply that all students got benefited from the group-based quiz setting. The current study tries to depict that effect.

Experimental Study

This section of the study covers the experimental study that was conducted by the researcher in his class. The section starts with the experimental study objectives and methodology, and then moves to the planning and implementation of the experiment. Finally, the section concludes with results and implications of the experimental study.

Experimental Study Objectives

The experimental study aims at:

- i. Applying group-based quizzes as example of group-based assessment strategies used to test students' attainment of Course's Intended Learning Outcomes (CILOs).
- ii. Investigating the effect of applied group-based quizzes on low achievers' academic progress in the course throughout the semester.
- iii. Comparing between low achievers' progress throughout the semesters in which individual quizzes are applied and their progress throughout the semesters in which group-based quizzes were applied.
- iv. Measuring the gap between low achievers and high achievers throughout the semesters in both cases of applying individual quizzes and group-based quizzes,

Experimental Study Background and Methodology

The researcher has taught the course “Introduction to Project Management” over 11 semesters. The instructor used individual quizzes strategy in the first 9 semesters (79 students). However, he changed his strategy in the 10th and 11th semester (30 students) to group-based quizzes. The instructor used two types of group-based quizzes. The first type was the “quiz bowl” which was applied at the beginning of the second quarter in the semester before midterm exams. The second type was the “sit-group quiz” and it was applied at the beginning of the third quarter of the semester between midterm and final exams.

The experimental study methodology is based on four interlinked stages. The *first* stage is the planning stage, in which the group-based quizzes and their evaluation criteria were designed and the students groups were identified. The *second* stage is the implementation stage, in which students’ groups sat for the quizzes and their performance was graded over two semesters. The *third* stage is the analysis stage, in which students’ achievement in both group-based quizzes and individual-based assessment strategies were analyzed in order to come up with some findings. The *fourth* stage is the comparative analysis stage, in which students’ performance and progress rate in the two semesters where group-based quizzes were applied is compared to the results of the previous nine semesters in which no group quizzes were applied at all (only individual-based quizzes) in order to trace the effect on low achievers. The following section explains in detail the stages of the experimental study.

Experimental Study Planning

The experimental study was applied in the course “Introduction to Project Management” during 11 semesters (total of 109 students). Students were classified according to their academic abilities (achievement) into two categories: Low Achievers (LA) (Those students with Cumulative Grade Point Average (CGPA) less than 2.7 out of 4) and high achievers (HA) (Those students with CGPA between 3 and 4 out of 4). Students with CGPA between 2.7 and 3 (medium achievers) were excluded from the experiment.

The instructor decided to use group-based quizzes in the 10th and 11th semesters (30 students). The class in both semesters was divided into groups of 3 or 4 students. The distribution of students among groups was based on their CGPA in a way that assures the balance between averages of students’ CGPA in each group. Another important factor was to combine low achievers with high achievers in each group.

The instructor decided to apply two different types of group-based quizzes during the semester. The first type (quiz bowl) was conducted after passing the first quarter of the semester (before the midterm exam), whereas the second type (sit group quiz) was conducted after passing the third quarter of the semester (between the midterm and final exams).

Applying Quiz Bowl Method

The instructor prepared the first group-based quiz (quiz bowl) with some rules to facilitate the smooth running of the experiment. The quiz bowl was based on twenty questions. Questions were structured on finding the suitable technical term or expression that was missing in an argument. A desktop bell (buzzer) was given to each group. The maximum allowed time for answering each question was 30 seconds. After listening to each question from the instructor, the timer started and each group had to try to answer before the other groups. Accordingly, the group which knew the answer had to activate the buzzer “ring the bell” (in this case, the other groups had to stay silent). If the first group’s answer was correct, a mark was recorded, and the next question had to start. However, if the group’s answer was wrong, a 15 seconds chance was given to the other groups to guess the correct answer. If any of the other groups’ answer was correct, a mark was recorded, and the next question had to start. If the other group’s answer was wrong, the instructor stated the correct answer and moved to the next questions. In this case, no mark was recorded for any group. In all cases, only one answer trial was allowed for each group. Figure (1) shows the quiz bowl flow chart.

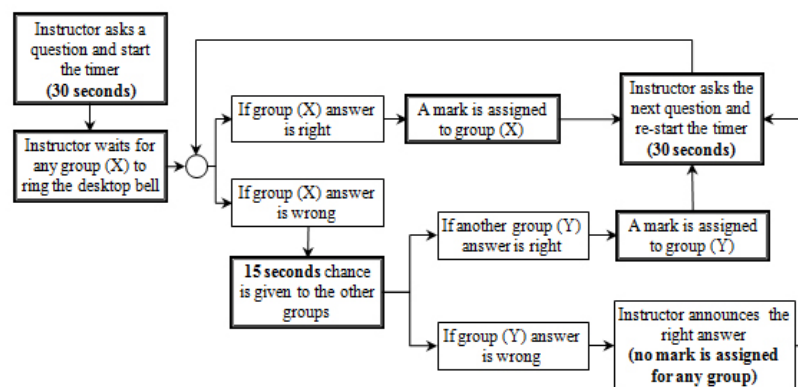

Fig. 1 Quiz bowl flow chart

Because of the time factor, which characterises quiz bowl method and differentiates it from individual sit quiz, a non-linear marking scheme was designed by the instructor. Table (1) demonstrates the difference between marking scheme of individual sit quiz and quiz bowl.

Table (1): Comparison between marking scheme of individual sit quiz and quiz bowl

Number of correct answers (out of 20)	Marking Scheme (out of 10)	
	Individual sit quiz	Quiz bowl
Zero	Zero	Zero
1 to 3	0.5 to 1.5	2.5
4 to 6	2.0 to 3.0	5.0
7 to 9	3.5 to 4.5	7.0
10 to 12	5.0 to 6.0	8.5
13 to 15	6.5 to 7.5	9.5
16 to 20	8.0 to 10.5	10

Applying Sit Group Quiz Method

The instructor prepared another type of group-based quizzes during the second half of the semester and after the midterm exam. The quiz was “group sit quiz”; it covered a further part of the course. The quiz consisted of 10 questions that should be answered in 5 minutes (30 seconds per question). The questions were printed and submitted for each group. The groups sit apart, each group’s members started to collaborate in answering the questions. The quiz was collected and marked (10 % of the mark is given for each correct answer). Figure (2) shows the sit group quiz flow chart

Fig. 2 Sit Group Quiz Flow Chart

Results of group-based quizzes semesters

The primary target of analyzing results of applying the previously mentioned group-based quizzes was to measure their effect on students’ performance and academic progress throughout the semester. The gap between low-achievers and high achievers was also investigated. The results of both group based quizzes and the two major exams (midterm exam and final exam) were analyzed in order to measure student’s academic progress in the course. Table (2) shows average of low achievers marks, high achievers marks and entire students’ marks in the four assessments. The table also illustrates the average of students’ marks in individual assessments (midterm and final exams) and the average of student’s marks in group-based assessments (quiz bowl and sit-group quiz). The academic progress curves and comparisons bar charts are generated from this table.

Table (2): Average of students’ marks in group-based quizzes and individual major exams

	Student's Marks (%)				Average of Individual Assessments Marks	Average of Group-Based Assessments Marks
	Quiz Bowl	Midterm exam	Sit-group Quiz	Final Exam		
Average marks of students (2 semesters-30 students)	72.33	86.97	76.50	76.30	81.63	74.42
Average marks of Low achievers (12 students)	69.58	81.63	74.17	70.90	76.26	71.88
Average marks of high achievers (18 students)	74.17	90.53	78.06	79.90	85.22	76.11
Average of students' progress (%)	72.33	79.65	78.60	78.03		
Average of low achievers progress (%)	69.58	75.61	75.13	74.07		
Average of high achievers progress (%)	74.17	82.35	80.92	80.67		

Figure (3) shows average marks of both low achievers and high achievers in the four assessment strategies. It also demonstrates the average performance of all students. The figure shows that:

- The class average lies between the low achievers average and the high achievers average in all the assessment strategies.

- The average performance of both low and high achievers in the sit group quiz is higher than their average performance in quiz bowl.
- The average performance of low achievers in the final exam (individual assessment) is lower than their average performance in the sit group quiz (group-based assessment).

Fig. 3 Average low achievers, high achievers and entire students marks (group-based quizzes semesters)

Figure (4) shows the average progress curves of low and high achievers, in addition to the entire classes in the four assessment strategies. The curves reveal that:

- The trend of academic progress for low and high achievers is similar, reflecting maximum progress after passing the midterm
- Both low and high achievers recorded the minimum marks in the first assessment. However, they progressed throughout the semester.
- The gap between low and high achievers was 4.58 in the quiz bowl. It increased in the midterm exam (6.74%), then decreased to (5.79%) in the sit group quiz. Finally, it slightly increased to (6.6%) at the end of the semester. See figure (5)

Fig. 4 Students' progress curves classified by students' levels (in group quizzes semesters)

Fig. 5 Average gap between low and high achievers (in group quizzes semesters)

Results of Individual quizzes semesters

As mentioned before, the instructor used individual quizzes strategy in nine semesters. The number of students over the 9 semester after excluding the medium achievers (students with CGPA between 2.7 and 3) was 79 (29 low achievers and 50 high achievers). The average marks of low and high achievers as well as the entire students' over the nine semesters were calculated. Table (3) shows the numerical data.

Table (3): Average of students' marks in individual quizzes semesters

	Student's Marks (%)				Average of Individual Assessments Marks
	Quiz 1	Midterm exam	Quiz 2	Final exam	
Average marks of all students (Individual quizzes semesters)	77.78	79.51	79.30	73.73	77.58
Low Achievers average (Individual quizzes semesters)	56.90	63.48	56.90	75.06	78.21
High Achievers average (Individual quizzes semesters)	89.90	88.80	92.30	78.43	87.36
Average of students' progress (%) (Individual quizzes semesters)	77.78	78.65	78.86	77.58	
Average of low achievers progress (%) (Individual quizzes semesters)	56.90	60.19	59.09	63.08	
Average of high achievers progress (%) (Individual quizzes semesters)	89.90	89.35	90.33	87.36	

Figure (6) shows average marks of both low and high achievers in the four assessment strategies. It also demonstrates the average performance of all students. The figure shows that:

- The class average lies between the low achievers average and the high achievers average in all the assessment strategies except the final exam.
- The average marks of low achievers in the midterm and final exams were higher than their average marks in the two quizzes. They recorded a higher average in the final exam. However, the average marks of high achievers in the midterm and final exams were lower than their average marks in the two quizzes. They recorded a lower average in the final exam.

Fig. 6 Average marks of low achievers, high achievers and entire students (individual quizzes semesters)

Figure (7) shows the average progress curves of low and high achievers, in addition to the entire classes in the four assessment strategies. The curves reveal that:

- The trend of academic progress for low achievers showed a positive progress towards the end of the semester. However, high achievers progress declined slightly towards the end of the semester.
- The gap between low achievers and high achievers was the highest at the beginning of the semester according to marks recorded in the first individual quiz. The gap decreased after midterm exam,

then increased again after sitting for the second individual quiz. Finally, the gap decreased significantly after marking the final exam. See figure (8)

Fig. 7 Students' progress curves classified by students' levels (in individual quizzes semesters)

Fig. 8 Average gap between low and high achievers (in individual quizzes semesters)

Group-based quizzes semesters vs. individual quizzes semesters

This section of the experimental study aims at comparing between low achievers performance and the academic progress in both cases of applying individual quizzes and group-based quizzes based on the previously highlighted data. The gap between low and high achievers in both cases is also studied. Figures (9) and (10) combine these comparison factors.

Fig. 9 Average progress of low achievers (individual quizzes semesters and group-based quizzes semesters)

Figure (9) clearly shows that, low achievers' marks during semesters in which group-based quizzes were applied were higher than low achievers marks during semesters in which individual quizzes were applied. This is noticed in all assessment milestones (1st quiz-midterm exam-2nd quiz-final exam). Figure (10) shows that the gap between low and high achievers' marks decreased significantly in all four assessment milestones after applying group-based quizzes in the course assessment strategies.

Fig. 10 Average gap between low and high achievers (individual quizzes semesters and group-based quizzes semesters)

In order to answer the research questions, inferential statistics methods were implemented to compare between low achievers' performance in both cases of applying individual quizzes and group-based quizzes. Accordingly, the null hypothesis (H_0) and alternative hypothesis (H_1) are as follows:

- H_0 : There is no significant difference between average marks of low achievers in individual quizzes semesters and group-based quizzes semesters
 - H_1 : Average of low achievers marks increase significantly when applying group-based quizzes
- In order to test the previous hypotheses, we need to compare between the average marks of two populations:
- Population I: Low achievers in group-based quizzes semesters
 - Population II: Low achievers in individual quizzes semesters

Table (4) shows the samples statistics related to the two populations

Table (4): Samples statistics

	Population I	Population II
Sample size (n)	$n_1 = 12$	$n_2 = 29$
Average mark of low achievers (\bar{X})	$\bar{X}_1 = 73.89$	$\bar{X}_2 = 60.73$
Standard deviation (s)	$S_1 = 6.49$	$S_2 = 17.73$
Variance (s^2)	$S_1^2 = 42.1201$	$S_2^2 = 314.3529$

As the populations with unknown variance, t test will be used according to the following equations:

$$t = \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{Sp^2}{n_1} + \frac{Sp^2}{n_2}}}$$

Where

$$Sp^2 = \frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}$$

By using the values in table 4 and applying equations 1 and 2, the value of t is 2.49. The critical value of t (giving that the alternative hypothesis is positive directional one (one tailed test), degree of freedom = $n_1 + n_2 - 2 = 39$ and significance level $\alpha = 0.05$) is 1.684. Accordingly, calculated t lies in the rejection zone of H_0 . This reveals that there is a significant increase with significance level $\alpha = 0.05$ in low achievers average mark when applying group-based quizzes in the course.

Fig. 11 Critical and calculate Critical t 1.684 t_c Rejecting H_0

Discussion And Limitations

This section of the study attempts to discuss the results and limitations of the experimental study with reflections on the theoretical background and the research question. Finally, the study ends with a conclusion, recommendations and directions for further research.

Discussion

- Yokomoto & Ware (n.d.) refer to a concern that the instructor may think of when incorporating collaborative learning, which is how can grades be assigned meaningfully if some students receive higher grades on group-based assignments than they would earn individually. This case frequently occurred in the current experiment. Many studies have recommended mixing both individual assessment and group-based assessment strategies in course management. This mixture helps in testing each student's individual performance, in addition to his interpersonal skills. From another point of view, Yokomoto & Ware (n.d.) defend the use of group quizzes as assessment strategies. They explain that incorporating group quiz scores in individual's course grade is unlike using homework scores. In their experiment, Gaudet et al. (2010) found out that group quiz mark was higher than the individual quiz mark of highest achievers in each group (p. 1). This reveals that mixing low-achievers with high-achievers has a positive impact on both groups. The current study supports this result.
- It is preferred to mix group-based and individual assessments and try to monitor and compare between students' performance in both types. The current study partially points to this comparison through including both midterm and final exams' marks. Individual homework assignments (20% of the course's total mark) were not included in the experiment as they were not fully monitored by the instructor. Yokomoto & Ware (n.d.) note that students often seek assistance on their homework, and hence it is difficult to determine how far a student's paper represents his/her individual work.
- The theoretical and practical parts of the study pinpoint the importance of bridging the gap between low and high achievers. Yokomoto & Ware (n.d.) uses the term 'academic vacuum' to describe this gap. One

of the academic advising challenges is to monitor the academic progress of at-risk students through finding possible ways that help low achieving students to raise their GPAs so that the gap between them and high achievers can be reduced.

- The type of questions offered in both group-based quizzes allowed the instructor to give an instant mark for both groups direct after finishing the quizzes. For students, this raised the degree of excitement. In the quiz bowl, students could easily calculate their marks after each question based on the detailed criteria that was given to them. Students appreciated receiving feedback from the instructor on the spot, especially in case of quiz bowl method. Carless (2015) asserts the importance of “same-day feedback”. Through an experiment on learning-oriented assessment, he found that “the same-day discussion and debate also brings elements of dialogue into the feedback process” and “feedback aims to clarify issues immediately and feed-forward to future related tasks” (p. 973).

Limitations

- In the group-based quizzes semesters, students were classified according to their CGPA in the previous semester into two groups: low achievers and high achievers. Medium achievers were neglected. Some previous studies have included medium achievers as well. Dohaney et al, (2012) conducted a study to test the effect of collaborative learning on students learning gain. They mixed between low, medium and high achievers in the same group.
- The experimental study was limited to in-class assessment strategies (quizzes, midterm exam and final exam). These assessment strategies formed 80 % of the total course mark. Assignments and homework (20%) were, intentionally, not included in the experiment for the reason stressed by Yokomoto & Ware (n.d.) as mentioned in the discussion section.
- The experimental study was applied to one course (introduction to project management) over several semesters. Applying the experiment in different types of courses is highly recommended.

Conclusion And Recommendations

Conclusion

The researcher demonstrated the transformation of higher education concepts. He pinpointed the idea of active and collaborative learning through group-based assessment strategies as one of the features of that transformation. The applied part of the study aimed at comparing between the effect of collaborative learning through group-based quizzes and the effect of traditional individual quizzes on the academic performance and progress of low achieving students. Two examples of group-based quizzes were applied during two semesters in the course of “introduction to project management”. The academic performance of low and high achievers, in addition to the entire class was measured during these semesters and compared to the academic performance in previous individual quizzes-based semesters. It was found that academic performance of low- achievers in quizzes as well as midterm and final exams was considerably higher during semesters through which group-based quizzes were applied. Moreover, using group-based quizzes significantly helped in reducing the gap between low and high achievers’ academic performance.

Recommendations and directions for further research

- It is preferred to combine group-based and individual assessments and to monitor and compare between students’ performance in both types. This study partially outlined this comparison.
- It is very important that the instructor monitors the behaviour and contribution of each student within a group. One of the possible drawbacks of cooperative learning is the potential unbalanced role of students within the group. Walter (2000) states that ‘cooperative learning is most likely to go wrong when one of the students does all the work while others watch’ (p. 1).
- Generally, it is highly advised that the instructor utilises various types of group-based quizzes that put groups in an exciting and active learning situation.
- It is important to strengthen the effectiveness of academic advising in monitoring the academic progress of at-risk students through finding possible ways that help them to raise their GPA so that the gap between low and high achievers can be reduced.
- Further study is required to observe and analyze the behaviour and motivation of low-achievers during implementation of active and collaborative learning. Different ways of grouping students can be experimented. For example, a comparative analysis study can be applied on various students’ group settings (grouping low-achievers together vs. combining low and high achievers).
- Further study is needed to examine the effect of other methods of group-based quizzes on students’ academic performance during the semester.

Promoting Best Practices Of Computer Based National Exam (Unbk) Achievement In Indonesia

Bagus Hary PRAKOSO¹ and Didi PUJOHADI²

^{1&2}The Center for Educational Assessment

Ministry of Education and Culture – Republic of Indonesia

bagushprakoso@gmail.com

Abstract

The crucial issues of the Computer Based National Exam (UNBK) implementation in Indonesia related to distribution of achievements and resources. Responding to those issues, it requires study with aimed at generating hypothesis of best practices of UNBK achievement which contribute to formulate policy on national assessment program. Case studies of senior high schools in some provinces and local policies of the Yogyakarta Office of Education are selected for comparative analysis that can be a useful way to generate hypothesis. The study shows that in teaching and learning processes, the schools not only focus on UNBK achievement, but they also focus on broader achievement to enhance education quality. Further, the study generates hypothesis that in order to improve UNBK achievement and education quality require multi-approaches which supported by public participation and sociocultural strength.

Keywords: *Computer Based National Exam (UNBK), multi-approaches, public participation, sociocultural strength.*

Introduction

As an optional program of Indonesia National Exam (UN), Computer Based National Exam (UNBK) receives positive trending response from secondary schools in term of participation (63,20% in 2017), feed back, preparation quality, process, and result (Prakoso, 2017a). In short, UNBK program that really depends on educational technology is able to overcome the issue of assessment program objectively.

The positive trend can be observed from the participation of UNBK participants. For example in senior high school (SMA) level, in 2015 there were 134 science programs (IPA) and 129 social programs (IPS) that have implemented UNBK. In 2016 has increased to be 1209 for IPA programs and 1192 for IPS programs. The rapid increase has occurred in 2017, there were 6857 IPA programs and 8176 IPS programs.

In the context of achievement score, data by province shows a varied progress. As representative illustrations are presented five provinces that have the highest average score of UNBK for SMA IPA and IPS study program. In the following data, it appears that the five provinces in 2017 had an average score above the national average score of 66.23 for the IPA program and 63.58 for the IPS program. Selected data in 2016 and 2017 were considered to be consistently comparable (shown in **Table 1**).

Table 1. Provinces with highest average of UNBK for IPA & IPS programs

No	Prog	Provinces				
		Bali	Kalbar	DIY	Jateng	Jakarta
2017	IPA	71,95	71,53	67,62	66,43	66,21
2016	IPA	69,44	65,28	60,70	62,87	63,66
2017	IPS	67,71	68,97	68,96	65,46	66,67
2016	IPS	62,39	59,21	63,74	62,39	60,74
UNBK in %		39%	20%	99%	64%	99%

Source: Puspendik 2016 & 2017

More specifically, Roebianto et. al. (2017) stated that in IPA program, the average scores of Bahasa Indonesia, English, Physics, and Chemistry subjects have increased. Mathematics and Biology subjects actually decreased the average scores. While in IPS program has increased average score for all subjects, except Geography.

In the context of city participant, Roebianto et. al. (2017) stated that Surabaya city has the highest number of schools implementing UNBK from 2015 to 2017 in the province of East Java. Another note that the average score of UNBK in 2017 is still below the national and provincial UNBK averages. Nevertheless, Surabaya city has the highest Integrity Index of National Exam (IIUN).

Those data provide clue and crucial problems of the UNBK implementation. Firstly, most provinces have an average score below the national average score (academic achievements) for IPA and IPS programs. Secondly, there are still 36.80% of SMA/MA in Indonesia (<http://un.kemdikbud.go.id>) were not able to implement UNBK either as implementing schools or participating in other schools (facilities and challenges).

Observing those conditions, in order to improve education quality in Indonesia, it is necessary to formulate educational policies related to academic achievements and school facilities. One of the first ways that can be conducted is to provide best practices contributing inspirations and benefits both to policy makers and stakeholders.

One of the strategies to improve education quality is formulating best practice. According to Merriam-Webster, best practice is a procedure that has been shown by research and experience to produce optimal results and that is established or proposed as a standard suitable for widespread adoption. As a transformative function, Boissiere (2004) affirmed that quality has been at the core of the motivating forces for reforms in education. Furthermore, the United Nations Educational, Scientific, and Cultural Organization (UNESCO) stated that “good practice is a key element of the network’s strategy to contribute to promoting quality education ...” (<http://www.unesco.org/new/en/education/networks/global-networks/aspnet/good-practices/>).

To produce policy research that has a multi perspective approach, this study tries to enhance sharpness the draft study of Roebianto which only used quantitative data and single perspective. However, to improve the education quality through assessment program, it requires a multi perspective that matches to complex challenges. In the midst of data limitations, access difficulties, and time constraint, the purpose of this study is to generate hypothesis of best practices for UNBK implementation.

Research Method

To answer complex problem statements with limited data, and difficulty in access, the case study is selected as a research method. Yin (1984) stated that comparative analysis of cases can be a useful way to generate hypothesis about phenomena that combine complex phenomena, long-term dynamics, and difficulty in access.

Qualitative and quantitative of primary and secondary data are used at this study (Eisenhardt and Bourgeois, 1988). Spiral analysis is taken by generating raw data, organizing data, reading and making notes, identifying themes, amalgamating themes, interpreting data, and back to reading and making notes (Creswell, 2009).

Mixed data of some areas and schools are used in data collection. In order to be consistent in comparison each year, data of schools were also utilized in succession following UNBK. To complement quantitative data, interviews with school principals have been conducted in 4 cities (Malang, Palangkaraya, Surabaya, and Yogyakarta). Based on secondary data, five schools have been visited to obtain qualitative data are referral schools that have high average score for UNBK.

Case Studies

Here are the mean score and standard deviation data that commonly asked by schools and public related to the UNBK achievement. To complement quantitative data, this study provides strategic points that are relevant to the research aim.

Case Study 1: SMAN 5 Surabaya

Table 2. Mean Score for SMAN 5 Surabaya

		IPA Program			IPS Program		
		2017	2016	2015	2017	2016	2015
1	Mean	81.97	79.68	82.31	77.83	75.70	79.78
	Std. Deviation	(27.17)	(39.44)	(35.14)	(39.69)	(48.19)	(22.50)

Strategies to improve the UNBK score and implementation:

1. Cultivating the understanding that the UN score will affect the academic achievement of the students in universities

2. Providing reward to the team of subject teachers through academic achievement competition of among subjects
 3. Providing school contract for academic achievement that "SMAN 5 Surabaya will achieves the top 10 ranking in East Java."
 4. Inviting the Tuition Center (bimbel) for the deepening of the UN materials
- Source: Rahmah Zulaiha, November 2017

Case Study 2: SMAN 6 Surabaya

Table 3. Mean Score for SMAN 6 Surabaya

		IPA Program			IPS Program		
		2017	2016	2015	2017	2016	2015
1	Mean	74.74	72.17	71.28	72.36	65.75	61.92
	Std. Deviation	(29.58)	(46.49)	(46.17)	(40.19)	(46.22)	(32.78)

Strategies to improve the UNBK score and implementation:

1. Implementing Focus on Learning. The placement of students in the classroom based on permanent administrative criteria and flexible academic achievement. Administrative criteria is attended on Monday, while on academic achievement criteria is attended from Tuesday to Friday. The students of certain parallel class 12 may move to another parallel class according to the UTS score of the UN's subjects that have been ranked.
 2. Providing motivation of learning and achievement by parents of students conducting every Monday of the third week
 3. Optimizing the role of School Committees to assist the process and output of learning
 4. Cooperating with Tuition Center (bimbel) for deepening of the material and giving insight on the universities
 5. Visiting to some universities to add insight and motivation
 6. Visiting the Indonesia Naval Academy (AAL) aimed at instilling discipline to students
- Source: Rahmah Zulaiha, November 2017

Case Study 3: SMAN 1 Malang

Table 4. Mean Score for SMAN 1 Malang

		IPA Program			IPS Program		
		2017	2016	2015	2017	2016	2015
1	Mean	76.66	73.27	77.43	79.21	76.13	70.92
	Std. Deviation	(29.99)	(48.68)	(46.27)	(28.74)	(43.88)	(65.27)

Strategies to improve the UNBK score and implementation:

1. Doing socialization of standard operating procedure of UN (POS) and UN exam content outline (kisi-kisi), and conducting workshops for teachers on UN items and higher order thinking.
 2. Doing in-depth material and tutoring begin semester 6. It conducted at 06.30 - 08.30 before starting KBM. On Saturday, the 12th graders were given 4 hours of material deepening.
 3. Applying 5 semester program, in semester 6 students only review and get enrichment of UN subjects.
 4. Carrying out try out which conducted by schools and MKKS, as well as by the Education Office of Malang.
 5. Improving completeness of supporting facilities for teaching and learning process, collaborating with parents and local government.
 6. Improving cooperation and communication among schools, parents and the environment.
- Source: Heni Handayani, November 2017

Case Study 4: SMAK Albertus Malang

Table 5. Mean Score for SMAK Albertus Malang

		IPA Program			IPS Program		
		2017	2016	2015	2017	2016	2015
1	Mean	72.75	65.93	73.65	71.39	63.17	67.57
	Std. Deviation	(36.37)	(55.49)	(47.20)	(31.86)	(52.90)	(36.55)

Strategies to improve the UNBK score and implementation:

1. Doing socialization of POS and UN exam content outline (kisi-kisi) and conduct workshops to teachers on UN issues and higher order thinking.
2. Doing in-depth material and tutoring to students starting in the 6th semester, conducted before KBM.
3. Attending the semester 5 semester program. On the 6th semester, class 12 only review and enrich the subject of UN.
4. Doing in-depth material is carried out by school teachers, and evaluated by principal and vice principal of curriculum.
5. Carrying out try out made by schools and MKKS.
6. Improving completeness of supporting facilities for teaching and learning process, cooperating with parents and government.
7. Improving cooperation and communication among schools, parents, and surrounding environment to socialize POS UN.

Students who enter this school are quite heterogeneous. It appears from the composition of students that 50% come from various provinces in Indonesia, and not all students have high academic achievement. The role of the principal in motivating students through regular visits to each class seems to have benefit for academic achievement.

Source: Heni Handayani, November 2017

Case Study 5: SMAN 2 Palangkaraya

The Central Kalimantan Province (Kalteng) has become one of the concerns due to a significant progress for the IPA program score. By 2016, Central Kalimantan has an average score of UNBK of 47.64 (national average of 54.38) rose to 54.27 in 2017 (national average of 57.15). It is very interesting to be explored and searched for the cause.

Strategies to improve the UNBK score and implementation:

1. Carrying out three times try out, and once conducted by the Provincial Office of Education
2. Carrying out a Learning Clinic with aimed at assisting students who have learning difficulties.
3. Carrying out a Peer Tutoring by creating opportunity for higher score students to study together with lower score students
4. Intensifying the reinforcement of subjects starting from grade 12
5. Constructing the predicted exam content outline (kisi-kisi) that will appear at the UN
6. Constructing many items coming from each basic competency (KD)
7. Providing undigitized item banks managed by school and teachers

Source: Bagus Prakoso, November 2017

Case Study 6: DIY Provincial Office of Education

Strategies to improve the UNBK score and implementation:

1. The Provincial Office of Education coordinates with the District/City Office of Education to improve the UN ranking.
2. Conducting quality assessment test for schools, district, city, and province level
3. Professor Goes to School to motivate students and teachers to be more enthusiastic about learning
4. Providing awareness to parents about the importance of learning for children
5. The Local Government does not grant permission of crowd event at the time of exams
6. Improving awareness of parents to lend a computer for exam purposes

Discussion

Innovative Strategies for UNBK Implementation

In discussing to improve education quality through assessing UNBK implementation, ideally not only focus on educational assessment concepts such as item and response quality, exam and scoring process which are too technical. Moreover, it requires multidisciplinary approaches which have conceptual and strategic approaches.

As Van der Berg, et. al. (2011) stated that to improve education quality, it requires to employ six strategies such as (1) Developing capacity within the teaching force, (2) School Management for Instructional Leadership, (3) Strengthening relationships of accountability and support amongst stakeholders throughout the school system, (4) Sharpening accountability through better information to parents and education authorities, (5) Improve understanding of the language issues, and (6) Improve the quality of Early Childhood Development (ECD) facilities.

Van der Berg's strategy has indicated the importance of technical and managerial approaches, and multidiscipline. As best practices for UNBK implementation, the five schools are able to employ the five of Van der Berg's strategy with different weight of focus, process, and result. An unclear activity that can not be easily identified is related to improve the quality of Early Childhood Development facilities.

In general, the five schools have four main strategies to improve UNBK scores such as developing teacher competence, socialization of POS UN (standard operating procedure of UNBK), material deepening, and UNBK try out. However, they have innovative strategies that apparently contributed to school achievements and UNBK scores as well.

In implementing innovative strategies at school effectively, school principals and teachers must have competencies of how to build cooperation, participation, and commitment from inside and outside the school. The following table (Table 6) represents the selected innovations of each institution.

Table 6. Innovative strategies: Reflection of Concept and Practice

Innovation	Concepts	Benefits
SMAN 5 Surabaya Giving rewards for the team of subject teachers through competition of academic achievement of among subjects	Competition of academic achievement Chumacero, et al (2016)	"... competition has a positive, statistically significant, and economically relevant educational impact on private & public schools."
SMAN 6 Surabaya Implementing Focus on Learning. The placement of students in the classroom based on permanent administrative criteria and flexible academic achievement	Focus on Learning Glasser (1992)	In a school-reform effort needs to enhance the quality. Education is the process through which we discover that learning adds quality to our lives.
SMAN 1 Malang Conducting workshops for teachers on UN items and higher order thinking skills (HOTS)	HOTS (Barnett & Francis 2012) (Weeden, Winter, and Broadfoot, 2002)	Higher order thinking questions may encourage students to think deeply about the subject matter. The instrument assessment of higher order thinking can give stimulation as assessment for learning to develop students' higher order thinking.
SMAK Albertus Malang Improving communication and cooperation with student parents and government, and completeness of supporting facilities for teaching and learning process.	Parental Involvement (Borgonovi, 2012)	Parental Involvement can amplify a positive impact. The role of mediators (school) can be crucial for creating and maintaining trust among the school, pupil, family and community
Innovation	Concepts	Benefits
SMAN 2 Palangkaraya Peer Tutoring, giving opportunity for higher score students to study together with lower score students	Peer Tutoring Dineen, J. P. et al (1977)	Peer tutoring is profitable for the tutor as well as the tutee, provide a basis for recommending peer tutoring as one method of individualizing education.

Lesson Learned from DIY: Participation and Cooperation

D.I. Yogyakarta province (DIY) in many performances provides best practices not only in the education sector like UN, UNBK, IIUN and UKG (teacher competency test), but also in good governance. DIY position on the governance index is at the first rank (IGI Report, 2012). Good governance, character education, and local wisdom have a positive contribution to the quality of education including the implementation of UN and UNBK (Prakoso, 2017b).

In the context of education quality, the Provincial Office of Education has an innovative program which called Professor Goes to School. This program motivates students and teachers with aims to improve the educational equality and quality for education unit in DIY. When the program can be realized, people no longer need to flock to school in the capital city of DIY.

Associated with the UNBK implementation, Provincial Office of Education promotes awareness of parents to lend a computer for exam purposes. The purpose of this activity is the implementation of UNBK 100%. The result is quite successful and competitive when compared to DKI Jakarta province which has the highest education budget in Indonesia (22.3 percent).

In practice, both programs strongly require participation and cooperation. In cultural values, some schools (e.g. SMPN 4 Sleman DIY) practice some values of dedication, habituation, strong example, and how are good and right (*apik'e piye, benere piye*). These daily values have been supported by the teacher's accompaniment for the students from the incubation process until the hatching process (interviewed by Bagus, September 5, 2017).

At the province level, it might be observed from its policy governance. In December 2010, DIY has launched the Spirit of Mutual Cooperation called "*Agawe Majune Ngayogyakarta*" (*Segoro Amarto*). *Segoro Amarto* principle is independence, social awareness, mutual help, and discipline. *Segoro Amarto* policy aims to enhance social justice, and make life more comfortable, prosperous, and independent (Suroatmojo, 2015).

The lesson learned of this case that governance's participation within school can be carried out through active participation of school committees consisting of various stakeholders. All elements of school stakeholders work together. Good participation to cooperate can occur because there are supportive sociocultural factors. In Javanese culture, mutual assistance and interpersonal skill are part of the internalization process in capability development (Wardani, et al. (2013).

Education and Governance: Equality and Integrity

Khan (2003) comprehensively stated that governance is a multifaceted concept with wide ramifications. No country can afford to continue with a governance system that is outdated, slow, ineffective, expensive, and corrupt in this age of globalization.

In measuring governance, it measures the compliance of government and bureaucracy on the six principles of good governance such as transparency, participation, accountability, fairness, efficiency and effectiveness (<http://fia.ub.ac.id/wp-content/uploads/2014/01/handout-pgi.pdf>). Governance practice in education quality can be traced and identified from the average score of the Integrity Index of National Exam (IIUN). IIUN is an instrument to measure integrity of students when they participate in UNBK. To this case, British and Irish Ombudsman Association (2009) stated that "integrity" is part of six principles in governance. Then, Aulich stated that integrity agencies as one pillar of integrity through development of a system (Aulich, 2011).

People may state that we have not any doubt to those five schools as best practices. They can do anything they want. It is because these schools have much better of family and social economic background. For this matter, Gamoran, Secada, & Marrett (2000) stated that student's family background is far more important school social composition and school resources for understanding student outcomes – still retains much of its currency. How are the other schools in Indonesia that the majority they are inadequate of input, capacity, stakeholders, and other resources?

Connected to that problem, the researcher states that the adequacy of input, capacity, stakeholders, and other resources at school level can be felt directly the significance. However, at the macro level, sufficiency of those advantages is not enough. Other factors affecting academic achievement or education quality are related to teacher competency and governance.

Prakoso (2017b) has found that inadequate quality of governance, unsupportive socioeconomic and cultural factors apparently become the reasons for weak quality of education in Indonesia. That statement is affirmed by Office of Democracy and Governance (2003) that good governance provides policy and legal mechanisms which enable countries to address issues of educational equity, support education for all, provides for citizen participation in the design and oversight of public services.

Data in table 7 may provide a comparative description among governance performance (Indonesia Governance Index or IGI), teacher competence or UKG (Muzenda, 2013), and educational budget on education quality indirectly.

Table 7. Performance of Provincial Governance

N	Provinces with highest UNBK score	IGI Ranking	IGI (2012)	UKG (2015)	Education Budget (%)
1	DI. Yogyakarta	1	6,80 (high)	67,02	9,7
2	Jawa Timur	2	6,43 (high)	60,75	1,7
3	DKI Jakarta	3	6,37 (high)	62,58	22,3
4	Bali	5	6,23 (high)	60,12	3,7
5	Kalimantan Tengah	12	5,95 (medium)	51,78	3,0
6	Jawa Tengah	16	5,88 (medium)	63,30	2,9
7	Bengkulu	31	4,81 (low)	54,13	7,6
8	Maluku Utara	33	4,45 (low)	44,78	9,2
	National			56,69	

Source: IGI Report (2012), npd.data.kemdikbud.go.id/, and <http://www.kemendagri.go.id/news/2014/10/15/ini-hasil-tata-kelola-daerah-versi-igi>

As an instrument, IIUN is quite effective to reduce the systematic dishonesty for every school implementing UN. It can be noted that there was improvement of integrity index on 24 from 34 provinces observed (<http://www.cnnindonesia.com/nasional/20160510011843-20-129580/indeks-integritas-sma-meningkat-nilai-ujian-nasional-turun/>). In this case, Prakoso (2017) has a more specific opinion that is employing IIUN is quite effective to enhance academic integrity for a particular scope.

The UNBK implementation which connects to IIUN result actually created some challenges. As stated by Haryo (2017) that the geographical factor and difficulty of access are also suspected to have an impact on the quality of information system, monitoring and evaluation, and exam implementation. Besides that, supporting facilities and infrastructure (electricity, computer laboratory, and internet) are strongly suspected to affect the level of the UN result in integrity and objectivity context.

Conclusion

Based on the case studies and conceptual reflections, this study proposes some hypothesis that firstly, in order to improve UNBK score and school achievement requires technical and strategic approaches. Secondly, in order to improve UNBK score and education quality in the macro (broader) level, the technical and strategic approaches at each school should be supported by participation and cooperation (governance) among stakeholders (schools, community, government, and business sector) which supported by social culture strength.

ABSTRACT

The purpose of this paper is to promote the understanding of students on STEM (Science, Technology, Engineering, and Mathematics) concepts. To work towards this fundamental aim in a time efficient method, we developed a blended learning course consisting of online material and practical on site activities. More specifically, a structured course consisting of units with specific objectives, video lectures, try-out activities and online tests has been developed. A number of schools have been invited to enroll to this course and Arduino kits have been delivered to them in order for the students to implement the practical activities. Each student group had to complete the course within a short period with the supervision of their teacher. Students have enthusiastically completed all the activities with the aid of their teachers. After the course, they could better understand issues like the utility and importance of switches, resistors, capacitors and in general of the principles of electronic circuits.

INTRODUCTION

Students can undoubtedly operate computers and mobile devices quite effectively, but most of them have little understanding of the inner workings of a computer and in general of the working principles of electronic devices. Therefore, the need to promote the understanding on these topics, which fall under the broad term of STEM (Science, Technology, Engineering, and Mathematics) education (Breiner et al., 2012), is essential. Moreover, in a rapidly changing era, students have to develop skills and practices involving innovative technologies, in order to be competitive and successful. To work towards this fundamental aim in a time efficient method, we developed a blended learning course consisting of online material and practical on site activities.

Empirical research has shown that learning can be improved when instructors follow a more student-centered, interactive instruction (Handelsman et al., 2004). STEM education projects are student-centered as the learners have to build and test various tools and systems and comprehend through this process various theoretical concepts and to gain practical skills. Different kinds of STEM projects have been implemented. Online virtual labs and data sets from physical laboratory experiments have been used for large-scale use in education (De Jong, Soteriou & Gillet, 2014). These labs offer the opportunity to students to perform scientific experiments with online labs in pedagogically structured learning spaces. Whitman and Witherspoon (2003) used LEGOs to interest high school students and improve k12 stem education.

Different kinds of enabling technologies and physical artefacts have been developed and have been applied to STEM learning projects. Microcontrollers, like Arduino (<https://www.arduino.cc/en/Guide/Introduction>), are popular in STEM education. Innovative projects have been developed using these devices. For example, a low cost educational robotics kit based on the UNO Arduino platform is discussed in (Junior et al., 2013). The prototype is used in secondary educational schools and is accompanied by documentation that addresses basic physics, mathematics, logic programming and robotics concepts. A low cost robotics system for educational purposes,

based on Raspberry Pi, has been used for teaching STEM concepts (Saleiro et al., 2013). Various Arduino projects have been created for grade levels ranging from grades 7-12 (Herger & Bodarky, 2015). Students have been engaged in basic elements of engineering and computer programming. In general, the introduction of the use of physical artefacts in the teaching of the curriculum of a Computer Science department has been successful in motivating and engaging the students, with a resultant improvement in student progression (Currie & James-Reynolds, 2017).

Arduino is an open-source electronics platform based on easy-to-use hardware and software. Arduino boards are able to read inputs from sensors (digital and analog) and turn it into a digital output - activating a motor, turning on a LED, publishing something online, etc. Arduino has certain advantages from being inexpensive and cross platform to being extensible with additional shields, i.e. electronic boards implementing specialized operations like wifi communication. Arduino comes in different versions with different capabilities. Figure 1, shows an Arduino Uno board and Figure 2 a simple project with an Arduino Mega board.

Figure 1: An Arduino uno microcontroller

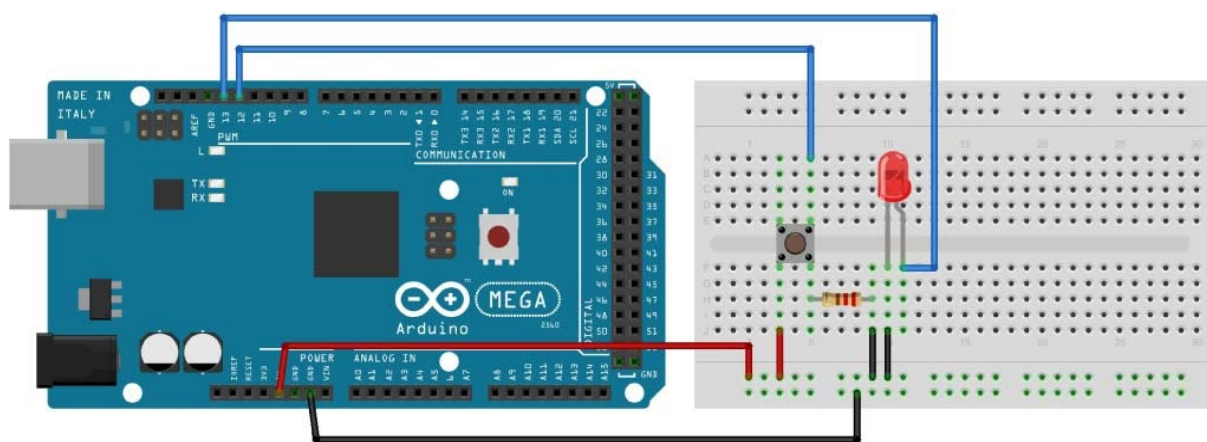

Figure 2: A simple project with resistances, switches and led using Arduino mega

Arduino boards include analog ports for input from analog devices and digital ports for communication (input and output) from and to sensors and other devices. The inputs are processed by the code which is loaded on the board and suitable outputs are produced. The code is developed primarily in a C like programming language using the Arduino IDE, an open-source environment that helps users to write code and upload it to the board. That way different sensors and devices can be connected to Arduino and through coding they can be controlled to create complex systems.

In this work, we focus on helping students to develop Arduino projects through distance learning. In this way, we offer the opportunity to children that are educated in typical public school systems to acquire knowledge in microcontrollers and basic programming concepts. We describe our effort in the rest of the paper.

THE UNIVERSITY OUTREACH PROGRAM

The primary aim of our work was to engage students in Arduino projects in a time efficient mode. Through a university outreach program we aimed at teaching: *i.* Teachers and *ii.* Students of junior and senior high school (ages 12-18). It would be very demanding in terms of time and cost to run the outreach program in live face-to-face sessions. Hence, it was decided to run it in distance learning.

The literature has shown that MOOCs (Massive Open Online Courses) have a low completion rate, there is a lack of student support and interaction with other students and teachers, the teacher to student ratio is low (Eriksson, Adawi & Stöhr, 2017; Guo & Reinecke, 2014; Liyanagunawardena, Adams, & Williams, 2013). So we needed a more supportive structure which could also accommodate a large number of students. To achieve this aim we developed a blended learning course, which is a course consisting of:

- face-to-face meetings,
- online text (in html and pdf format),
- online asynchronous video lectures,
- synchronous sessions and
- focused and prompt support via forums and email.

The organization of the outreach program provides increased support to the participants so as to improve the completion rate and to support the needs of the learners.

An initial face-to-face meeting was held so as to:

- introduce the educational aims,
- showcase the Arduino kits,
- introduce the participants to the online platform,
- run together a project step by step,
- lend the Arduino kits (5 kits – boards with a set of sensors, leds and connection wires) to each school.

Figure 3: The structure of the e-course in Moodle

Then the participants have to study the online video lectures and to complete the activities. The course consists of units with specific objectives, video lectures, try-out activities and online tests and it has been developed in Moodle (see Figures 3 & 4), a popular open source Learning Management System suitable to manage its training content and allow for communication and interaction among students and teachers. The video lectures act as facilitators promoting self-learning, helping students to develop critical thinking skills. The try-out exercises, the quizzes and the assessment activities increase the active participation of the learners and follow a ‘problem solving’ approach. Easy or more difficult problems are posed, which require specific and measurable actions on behalf of the learners.

REALIZATION & EVALUATION OF THE COURSE

The material has been developed between November 2016 and March 2017 and the outreach activities have been deployed in 3 different streams involving various regional areas of Greece from March 2017 to December 2017. Each stream lasted 3 months and the participants were school classes, the students of which, with the help of a

local teacher, studied the online material. It would be difficult for individual students to participate as it would be difficult to distribute the Arduino kits. Therefore it was decided to include entire school classes. That way the Arduino projects would be followed by the school classes and implemented in a school class during school working hours with the help of their local teacher. This organizational model further improves the support to the students and it ensures that all the students will participate in the program. It also reduces the communication load as our support group communicates with only one person per school.

Figure 4: Examples of video and interactive activities of the Moodle course

A number of schools have been invited to follow this course and Arduino kits have been sent to them in order for the students to implement the practical activities. In total 10 schools, 223 students and 12 teachers have participated in the blended learning course. At least 10 projects per school have been implemented. Some new Arduino projects, as a result of the new acquired skills, have been realized. Students have enthusiastically completed all the activities with the aid of their teachers. After the course, they could better understand issues like the utility and importance of switches, resistors, capacitors and in general of the principles of electronic circuits.

CONCLUSIONS

In this paper we discuss a University outreach program with the aim to improve the understanding of STEM concepts of students. An e-course with teaching material (video lectures & interactive activities) about Arduino has been created. The program was run in a blended learning approach. In this mode we managed to effectively support the student groups and to help them complete all the tasks. Students were able to create a few electronic circuits and obtain practical skills. Based on the reports submitted by the participants, the students understood the role of components like resistances, switches, leds, and other sensors and the importance of correct connection of the components. They also did some programming using the Arduino programming environment.

We plan to repeat the activity during the next school year with some extensions and modifications to the learning material. More optional activities will be added, to maintain the interest of the most accomplished learners. To further improve the support towards new learners, we will engage teachers who have completed a previous run of the course, to help us, on a voluntary basis.

ACKNOWLEDGMENTS

The project has been implemented by the Intermedi@KT NPO and the Hellenic Open University with the aid of a grant under the Google RISE program.

Prospective Teachers' Perceptions And Attitudes On Renewable Energy: Modelling The Relations Between Sub-factors with SEM

Mustafa AKILLI
Uludag University
akilli@uludag.edu.tr

Murat GENÇ
Duzce University
muratgenc@duzce.edu.tr

Abstract

In recent years, after becoming a global problem of energy issue, developed and developing countries enhanced their researches and improved their politics about energy. Certainly one way of these politics passing through education. With qualified and well-organized education programs individuals who will be important parts of our future will be educated with positive attitudes, awareness about energy and future vision. In this context the aim of this study is to demonstrate the perceptions and attitudes of prospective teachers about renewable energy and modeling the relations between sub-factors of perceptions and attitudes. For this aim, “renewable energy perception scale” with 3 sub-factors (renewable energy knowledge, renewable energy future vision and renewable energy tendency) and “renewable energy sources attitude scale” with 4 sub-factors (application request, the importance of education, country interest and environmental awareness and investments) were used. The study was conducted by the analysis of prospective teachers' answers to scales data using Structural Equation Model. The participants in this study included 1145 prospective teachers in Turkey SEM was used with performing LISREL software. Initially KMO and Bartlett's tests were done to test appropriateness of scale to factor analysis. Then theoretical structural model was tested using LISREL. According to results it was found that there is positive relations between the sub-factors of attitude and perceptions.

Keywords: *Renewable energy, attitude, perception, prospective teachers, structural equation model (SEM)*

Protection And Processing Of Personal Data In The Field Of Education And Explicit Consent

Abdurrahman SAVAS

Istanbul University Faculty of Law Departman of Roman Law Istanbul/TURKIYE

abdurrahman.savas@istanbul.edu.tr

Abstract

The concepts of protection and processing of personal data are two concepts that are closely related to each other. Along with the development and widespread use of technology, as well as becoming mobile, the emergence of personal data has become much easier to collect, store and share. By analyzing these personal data, it has been possible to reach a lot of knowledge about the data owner. In fact, with the beginning of marketing of some of these data, some of which are unknown even to the data owner, data owners have become anxious and this has become a violation of the fundamental rights and freedoms of others and harming them. For this reason, regulations for the protection and processing of personal data have begun to be made. In this context, the education they have received, the content of this education, and a lot of data about it can be included.

Some basic principles on the processing of personal data have been adopted. The first of these principles is that the process must be in accordance with the rule of law and honesty (*bona fide*). In addition, the processed data must be accurate and up-to-date. Another requirement is that the process is done for specific, clear and legitimate purposes. The processed data may be stored for as long as is required by the legislation or for the purpose for which it is being processed.

As a rule of thumb for the processing of personal data, the explicit consent of the data owner is required. In some cases, this explicit consent is not sought. In addition, some personal data are treated as private personal data, and different requirements are sought for their processing. Explicit consent, which is a condition for the processing of the data, must be given in relation to a specific issue. the person to be recruited must also be informed. The consent to be received from the data holder may be in writing, verbally, or by email.

Introduction

The development of social life and its increasingly complex nature also result in the further spread of our own data. This personal data belonging to us is often not a mystery. Many of our information, such as our name, telephone number, home address, whether we are working or not, our business address, our marital status, our family, and so on, are personal details that are not confidential. Even if this data is not disclosed by us, it can be obtained from external observation and simple research. On the other hand, people may want to conceal this data which belongs to them for many reasons. They may not want their job or their marital status or their religious beliefs or values to be known by others. This is because the information that others will obtain about themselves can be used to harm them again (Gürpınar, 2017, p. 681-682).

We do not have to physically come together to communicate with others in the information age we are in and we do not need to be physically at the same place to transfer our information and data to others. Even In order to transfer personal data to more than one person, there is no need to perform separate transactions. Our own data can be delivered via the internet in very different places in the world and in the hands of millions of people. This data, which is processed through developing computer programs, can be used to obtain many results about ourselves that we do not even know about. These results can be used against the data holder or against the society in which he lives and even against the country that we live in. It is perhaps the most innocent way to make an unfair advantage over this data. For this reason, the data belonging to the persons must be protected and should not be processed without the permission of the owner. However, the concept of personal data is such a broad concept that protection and processing must be linked to certain rules. For this purpose both in Turkey and in the European Union, some regulations related to the protection of personal data processing are made.

Regulations Regarding The Processing And The Protecting Of Personal Data In Turkey And The European Union

Regulations In The European Union

The European Convention on Human Rights, adopted by the Council of Europe on 4 November 1950, is regarded as the first accepted regulation on the protection of personal data. It was recognized that the regulation on private life and the right to protection of family life contained in Article 8 of this Convention could also be enforced in the protection of personal data (Akgül, 2017, 181). The Council of Europe later adopted in 1981 the Convention for the Protection of Individuals with regard to Automatic Processing of Personal Data (ETS No. 108). The purpose of the adoption of this convention is to identify the principles to be considered by public and private

organizations in the protection of personal data and to set an example for legislation to be taken at the national level in this respect (Kılınç, 2012, 1112).

In 1995, the European Parliament and the Council adopted Directive on the Protection of Individuals with regard to the Processing of Personal Data and on the Free Movement of Such Data (Directive 95/46/EC) and this Directive entered into force in 1998. The European Parliament has reorganized a regulation adopted on 27 April 2016 and published on the Official Journal of the European Union on 4 May 2016.

This regulation, called " Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC", came into force on 25 May 2018 and Directive 95/46/EC was repealed.

Regulations In Turkey

The basic arrangement in the national legislation concerning the processing of personal data is the article 20/3 added to the Constitution with the amendment made by the law no 5982. According to the relevant regulation: "Everyone has the right to ask for the protection of their personal data. This right contains; informing the individual about his or her own personal data, accessing it, requesting correction or deletion of it, and finding out if it has been used for its purposes or not. Personal data may only be processed in the cases provided for in the law or in the explicit consent of the person. The principles and procedures for the protection of personal data are regulated by law. "

Although the right to protect personal data was included in the Constitution in 2010, the Law on the Protection of Personal Data No. 6698, which regulates the procedures and principles related to this, entered into force on 7 April 2016. With this law, personal data has been defined, from this date it has become clear that personal data, in which situations, and against which acts and how it will be protected.

Concept Of Personal Data

The concept of personal data is defined in Article 3 of the law on the protection of personal data as "any information relating to a specific or identifiable real person". On the grounds of the law, not only the name, surname, date of birth and history of the individual, at the same time, information about the physical, family, economic, social and other characteristics of the person should also be evaluated within the scope of personal data. All the issues involved in the content of the concept of personal data are outlined In this decision of the Constitutional Court (see: 2013/122-2014/72 9/4/2014): "The concept of personal data refers to all information about a person who can be identified or identified. In this context, it is not only the information that reveals the individual's identity, such as name, surname, date of birth and place of birth; but also the informations of IP addresses, e-mail addresses, hobbies, preferences, contacts, group memberships, contacts, phone numbers, motor vehicle number, social security number, passport number, resume, picture, image and sound recordings, fingerprints, genetic information and all data that can be identified directly or indirectly, are included in the personal data".

Undoubtedly, personal data are not limited to these. The information on a student's test paper, the types and names of books he or she has received from the library, the sites and the searches made using the school's internet connection can also be considered as personal data.

Thus, personal data does not only contain information about the person's private life, but also includes all the information and data, including economic and professional information, that characterize a person as a particular person or person by revealing its identity (Akgül, 2014, p. 24).

Sensitive Personal Data

In statutory regulations on the protection of personal data, some data are subjected to more specific protection than other personal data due to their importance and sensitivity. The reason for this is that if these data are passed to the hands of malevolent people, they will be able to cause much more damage and discrimination in terms of data owners and other interested persons. In the Law No. 6698, sensitive personal data is not defined.

However, in Article 6 of the Law, the data relating to biometric and genetic data with data related to race, ethnicity, political thought, philosophical belief, religion, sect or other beliefs, costume and clothing, association, foundation or trade union membership, health, sexual life, criminal conviction and security measures, are classified as personal data.

Educational institutions should evaluate the qualitative data of students, teachers and other personnel as private personal data and should be more careful in protecting and processing these data. The use of very sensitive data such as handprints or fingerprints or retina scan of students and teachers at school entry should also be considered in this context. Because some studies on fingerprints have shown that biometric data can reveal some sensitive data such as health or racial or ethnic origins (Örnek Büken/Zeybek Ünsal, 2017, 42).

Concept Of Processing Personal Data

Processing of personal data is any process performed on the persons data. In the article 3 of Law No. 6698 any process performed on the data like obtaining personal data by the full automated or partially automated ways or non automated system which the part of any recording system, Recording, storing, preserving, altering, rearranging, disclosing, transferring, taking over, classifying or storing personal data is processing personal data. There are some important considerations to consider when processing personal data. Law no. 6698, Article 4, considered the principles to be considered in the processing of personal data. According to this article, first of all, personal data must be handled in accordance with the law. For example, the monitoring of the communication of persons should be carried out in accordance with the law. The processing of the data must also be in accordance with the rule of honesty. In the process performed by the data controller on the request of the concerned person, it has been determined that the requesting by the data controller a non-necessary document contains personal data from the customer, is in violation of the honesty rule.

Another condition for the processing of personal data is correct and, if necessary, up-to-date. This is also an obligation for the data controller as it is right for the data subject. The disclosure of a student's absenteeism information after many years of graduation and after being a civil servant violates the condition of being up to date. The processing of personal data must be carried out for specific, clear and legitimate purposes. The processing of identity and contact information of a gym wear shop customer can be considered within the legitimate purpose. However, it is not the legitimate aim of the customer to process blood groups.

The processing carried out in relation to personal data should be measured, limited and connected with the purpose for which the data are processed. The request and recording of the name and surname of a student enrolled in the school is reasonable. However, ethnicity or the religion or sect of the union or the child whose father is a member is not linked to purpose. The final principle that the Act requires to be considered in relation to the processing of personal data is that the processed personal data is retained for the time required for the purposes for which it is prescribed in the relevant legislation or for the purpose for which it is being processed. This also concerns the right to be forgotten at the same time (see, Çelik, 2017, 395-404).

Conditions Of Processing Of Personal Data And Explicit Consent

In order for personal data to be processed, the person concerned must expressly consent to it and give his explicit consent. The law defines the explicit consent. According to Article 3/1 of Law No. 6698 "relating to a specific topic, which is based on informed consent and free will-described" it is explicit consent. The first condition for validity of explicit consent is related to a certain issue. A consent, including general and all circumstances, is void (Kaya, 2011, 326). The consent given should be given as specific to a particular situation and the specific event to be processed must be clearly defined (Küzeci, 2018, 241). explicit consent can be obtained by comprehensively disclosing the purpose of processing sensitive data, as well as by recognizing the possibility of consent to the transaction through the corresponding sign or signature box (Küzeci, 2018, 243). On the other hand, if it has been stated that it is the consent of the person to remain silent, and no consent has been obtained and no explicit consent has been obtained when he remains silent.. The best way to avoid any problems is to get written consent.

Another condition for the validity of the explicit consent is the person to be received his consent must be informed about it. Explicit consent is a declaration of intent. For this reason, he must know what he consents to so that he can consent freely. This situation is also related to the concept of "Data Controller's Obligation to Inform" in Article 10 of the Law. People not only on the subject, but also on the results of the consent must have full information. Information should be understood in a clear and understandable manner in all matters relating to data processing. The information must be done before the processing of the data. The nature of the data to be processed will determine the level of information at the same time. The enlightenment of the person concerned also reflects the right of the person to determine his own future. The last condition for validity of the consent is that the of the consent must be given by free will. Consent, which is the declaration of will of the person, will be valid if it is aware of the behavior of the person and if his decision is his own decision. Any kind of verbal or physical act that interferes with the will of the person also interferes with the consent for processing of personal data. It is not possible for a person to decide freely in situations where force, threat, error, or trickery, which inflicts injury on the will. Therefore, in such cases, a statement of free will can not be mentioned (Kaya, 2011, 326). However, all the reasons there should be assessed within themselves, and the level of influence on the survey should be determined.. Where the parties are not in an equal position or where one of the parties is influential on the other, careful consideration should be given to whether the claim is granted with free will. Particularly in the case of an employee-employer relationship, where the possibility of not consenting to consent is not effectively provided or when the in the case of not consenting of the employee may cause a likely damage to himself, it can not be assumed that the claim is based on free will. Likewise, the consent obtained by pressure on the student in the teacher-student relationship framework in educational institutions does not apply. In the European Union, explicit consent is only required for the processing of special (sensitive) data. In Turkey, as a rule, explicit consent is required to process all kinds of personal data. In this regard, the Law foresees more protection than the regulations of the European Union.

Other Conditions For Processing Data Being Clearly Mentioned In The Law

Where the processing of personal data is clearly prescribed in the law, no explicit consent of the person concerned is sought. In accordance with the Code of Criminal Records, the Ministry of Justice's processing of persons' criminal convictions may be given as an example of cases explicitly mentioned in the Acts. Again, in the criminal procedure law, it is also possible for the law to permit the investigation of computer programs, computer records and computer files if the requirements of the law exist.

Finding Actual Impossibility On Receiving Consent

The second state in which no explicit consent request is made for the processing of personal data is compulsory for the protection of the life or body integrity of the person himself or someone else who can not explain his consent for the actual impossibility. For example, in an educational institution where the teacher has lost consciousness, the use of identity card information to inform his or her relatives or checking blood group or emergency response on an ID card or in a hospital to make an emergency medical intervention for a fainted student (Örnek Büken/Zeybek Ünsal, 2017, p. 43) or detection of telephone signals to locate the student of the scout club lost in the storm. In such cases it is impossible to refer to the consent of the person using the personal data before the processing activity.

Processing Of Personal Data Related To The Establishment Or The Performing Of The Contract

The performance of a contract of sale or transport contract or work contract is possible by learning and using the address and contact information of the shipper, buyer, or business owner. In such cases, it is possible to use the personal data such as address, communication etc. of the contractual parties without explicit consent. However, the personal data received during the contract negotiations should be returned or destroyed if the contract is not established (Develioğlu, 2017, p.60-61).

Being Publicized By The Data Subject.

Personal data publicized by the data subject can be processed in a manner that overlaps with the data subject publicizations and in accordance with the general principles without explicit consent. However, it is important that the definition of the concept of publicization is made correctly and the limit of publicizing is determined. For example, if a person sends his or her data to a mail group of 50 people working on the same team, it can not be talked about publicization. At this point, the intention of the data subject should be taken into account in accordance with the purpose of the Act. An example of a publicization can be the one that someone shared in the open LinkedIn profile. There is no need for the data subject's explicit consent to use / process this data for the purpose of making a job offer by others. It may not be a problem for parents and students to record the school ceremonies and musical events for personal use. However, obtaining the explicit consent of the students and teachers are required to use the picture is taken and used on the school's web page.

Sensitive Data

In statutory regulations on the protection of personal data, some data are subjected to more specific protection than other personal data due to their importance and sensitivity. The fact that this data is subject to more specific protection may lead to even more significant damage to the person concerned if it is violated or misappropriated by malicious persons.

For some authors, important or unimportant separation of personal data is not accurate. All data is important. On the other hand, if there is a violation, as in many legislation, the data that may cause more damage to the owner is called special or sensitive data (see Korkmaz, 2016, 113-114) . When the Directive is examined, it is defined as sensitive data of persons in race / ethnicity, political opinion, religious or philosophical belief, trade union membership, health status and sexual life in paragraph 8/1.

In regulation, the person's racial or ethnic origin, political opinions, religious or philosophical beliefs, trade union membership, health status and biometric and genetic data in addition to data on the sexual life, in addition to the sexual life, sexual preference data also has been recognized as specially qualified personal data.

In Convention No. 108, a person's racial origin, political opinions, religious or other beliefs, and data concerning health and sexual life conviction has been recognized as sensitive data.

In Turkish law, sensitive datas are limited in Article 6 of Law No. 6698. Accordingly, the datas on "persons' race, ethnic origin, political opinion, philosophical belief, religion, creed or other beliefs, costumes and clothing, associations, foundations or trade union membership, health, sex life, with biometric and genetic data on criminal convictions and security measures" are sensitive data.

Sensitive personal data are divided into two categories: "personal data on health and sexual life" and "personal data on other special qualifications other than data on health and sexual life." Accordingly, the datas on "persons' race, ethnic origin, political opinion, philosophical belief, religion, creed or other beliefs, costumes and clothing, associations, foundations or trade union membership, biometric and genetic data, and on criminal convictions and

security measures” may be processed with the explicit consent of the parties concerned or may be processed without the consent of the person concerned provided that it is foreseen in the law.

The personal data concerning health and sexual life only can be processed without seeking explicit consent for the protection of public health, preventive medicine, medical diagnosis, to carry out treatment and care services, planning finances to health services, and management purposes, by the people who are under confidentiality obligations or competent authority and by concerned organizations.

If the educational institution is also a treatment or rehabilitation institution, the sensitive data will be able to process without consent of the data subject.

Conclusions

With the complication of social life, the data about the person began to spread rapidly. For this reason, the need to protect data has increased steadily. For this purpose both in Turkey and the European Union, there have been numerous legal regulations. In these arrangements personal data are protected. It will only be processed with the explicit consent of the person concerned and can be processed without consent in cases specified in the law. Some of the personal data are considered sensitive personal data. the data on “persons’ race, ethnic origin, political opinion, philosophical belief, religion, creed or other beliefs, costumes and clothing, associations, foundations or trade union membership, health, sex life, with biometric and genetic data on criminal convictions and security measures” are sensitive data. The processing of this data is bound to more difficult conditions.

Many data on children and adults are being processed in educational institutions. In order not to violate the rights of data subject, these data must be stored carefully and processed when it is necessary. This process should also be limited in purpose. It appears that violations of the rules on the processing of personal data frequently occur in schools' libraries and web pages. In the processing of personal data of students and teachers, the rules set forth in Act number 6698 should be followed.

Abstract

Background: Hemodialysis keeps patients alive, soothes the symptoms of the disease, prevents complications and can interfere with patients' quality of life (QOL), especially when they do not have optimal levels of health literacy, a combination of cognitive and social skills. In other words, health literacy refers to the ability people possess to achieve the promotion and maintenance of their health, thus, enhancing their quality of life.

Objectives: To identify which socio-demographic and clinical variables may influence the QOL experienced by patients with hemodialysis; to determine the relationship between those patients' QOL and their health literacy.

Methods: A quantitative, descriptive, correlational and cross-sectional study with 100 patients suffering from renal failure who were undergoing hemodialysis at the Tondela-Viseu Hospital Center and at the Beirodial Medical Center and Dialysis Center in Mangualde. Most of the participants were male (56.0%) and elderly patients (70, 0%), with a mean age of 68.85 years (± 12.376 years). The data collection instruments used were socio-demographic and clinical characterization questionnaires: the European Health Literacy Questionnaire (HLS-EU-Q), the Health Literacy Survey (HLS-EU-PT) (Nunes & Sorensen, 2013) and the Kidney Disease and Quality of Life Questionnaire KDQOL SF TM1.3.

Results: Men manifest a better QOL in dimensions like the quality of their cognitive function, the quality of their social interaction, of their sleep, of the social support they receive, of their overall health, of their emotional function and of their vitality; women show a higher health level in dimensions like the perception of the symptoms / problems of the disease, of the impact of the kidney disease on their daily life, the intensity of the burden of their disease, the kind of professional activity they have been able to carry out during that stage, the kind of encouragement they receive from the staff who work in dialysis centres, the perception of their physical function and physical performance, the level of pain they have been enduring, their emotional performance and the quality of their social function. Adult patients show better QOL when they refer to the perception of the symptoms / problems related to the effects of kidney disease on their daily life and on their professional activity and on the quality of their social interaction, the kind of encouragement they get from people who work in dialysis centres, a better perception of QOL in relation to their physical performance, to the intensity of pain, to their emotional performance and social function. Patients with a lower school education have a better perception of their QOL in aspects related with the intensity of the burden of disease, their cognitive function, the quality of their social interaction, their satisfaction, their physical and emotional function and the kind of vitality they are experiencing. Patients with a higher school level have a better perception of their QOL in dimensions like the professional activity they have been able to perform, their sleep quality, the social support they receive, their physical performance, their general health and emotional performance levels. Patients living in rural areas manifest a better QOL in dimensions like the perception of the symptoms / problems caused by their condition, of the effects of the kidney disease on their daily lives and on their professional activity, of the kind of

encouragement they get from the dialysis centres staff, of their physical function and performance; they also reveal a more positive perception of QOL in factors related to the pain they have been enduring and the quality of their social function. Patients who live alone, without a partner, and who spent more time in their dialysis sessions present a better perception of their QOL. Patients whose treatment involves arteriovenous fistula present better QOL in dimensions that involve their perception of the effects of renal disease on their daily life, the condition of their cognitive function, the quality of their social interactions, the social support they receive, the quality of their physical performance, the level of pain they are enduring, the quality of their emotional function and performance and the vitality they have been feeling. Patients with an inadequate health literacy present better QOL in aspects that have to do with the burden of the kidney disease, with their cognitive function, their sleep, the social support they are provided with, their level of satisfaction, a better QOL related to their physical function and performance, to their emotional function and performance and to their level of vitality.

Conclusion: The results suggest the need for a greater development of intervention plans that may contribute to improve health literacy levels, a kind of intervention that will have a direct impact on the optimization of the quality of life of hemodialysis patients.

Introduction

Health literacy is much more than the general ability to read. Nowadays, people often have to face complex health information and to make therapeutic decisions. This process involves the need to analyze and assess reliable and quality information, to analyze the risks and benefits involved, to calculate the doses of the medicine they have to take and to interpret some of the results of their medical examinations (Sorensen, 2012; Fernandes, 2012).

Health literacy refers to that learning process through which any learning and active person will become aware of the inner capacities they possess and that are essential to develop competencies that will enable them to better understand, manage and assess knowledge in order to achieve a better health promotion. Health literacy implies the existence of a good level of knowledge, personal capacities and confidence in order to boost personal and community health by changing lifestyles and living conditions (Almeida, Silva, Gaspar, & Fonseca, 2014).

Health literacy is a right that belongs to every citizen and constitutes an important determinant of their health and quality of life (QOL) and that, on the other hand, reflects social inequalities. This kind of literacy includes psychological factors, such as motivation and the patient's perception of his own self-efficacy, social and environmental factors that will have an impact on health-related options and behaviours (Loureiro, 2015). Health literacy is the result of health promotion actions that include policies to reduce inequalities and the production of environments that are meant to promote healthy choices, health education, social mobilization and empowerment strategies (Loureiro, 2015).

Health literacy encompasses the patients' ability to communicate with health professionals, to read medical information, to make decisions about treatments, to follow medical regimes, and to decide when and how they need to seek medical assistance. Several studies have shown that poor health literacy, in spite of being a more prevalent condition in populations with poor economic resources, affects people of all ages, races and socioeconomic levels. Health literacy is associated with health care results (Fernandes, 2012).

Bearing all this in mind, it becomes clear that health literacy requires a holistic intervention and the use of a clear and understandable language that will make information accessible to everyone and will improve the patients' capacity to deal with the disease, will enable them to properly access health services and to better understand the situation they are going through and that will guide them as they seek the most appropriate solutions (Loureiro, Dinis, and Oliveira, 2012).

Literacy bears a close relationship with the patients' school level and involves knowledge, motivation and competencies that will enable patients to access, understand and appraise any kind of health-related information that will provide them with knowledge to make the right decisions about their health and its promotion and about the prevention of diseases, as a way to maintain or improve their QOL standards (Sorensen, Van den Broucke, Fullam, Doyle, Pelikan, Slonska, & Helmut, 2012).

Patients' literacy influences directly the kind of access they may have to crucial information about their rights and about health care, whether it involves following instructions about a certain treatment or therapeutic, understanding the information they are given and that is related to their disease or learning about disease prevention or ways to achieve health promotion (Luís, 2010).

Literacy levels can directly affect patients' access to health care. Poor literacy, which often goes hand in hand with feelings of embarrassment or shame, can reduce patients' ability to expose their fears (Loureiro, 2015).

In the early 90s, Shumaker and Anderson (1992), referenced by Albuquerque (2009), defined QOL as the overall individual satisfaction with life and the general and personal feeling of wellness. Cramer (1994), also quoted by

the same author, defined it as a state of complete physical, mental and social well-being and not merely the absence of disease and infirmity.

Following that same line of reasoning, those arguments are once again referred when the World Health Organization (WHO), in 1994, states that QOL is the individual perception that people have of their attitude in life in the social, economic and cultural context where they belong, taking into account their culture, values, life goals, social relationships and life expectations. Paschoal's definition (2010) is very similar as he defines QOL as an individual's perception of their position in life in the context of the culture and value systems in which they live and in relation to their goals, expectations, standards and concerns. In Silva's perspective (2011), QOL can be composed of several levels and may be represented by a three-level model: in the first level, we can find the person's overall quality of life; in a second level, we will find the physical, psychological and spiritual dimensions; and finally, there will be a level that will include the different elements that will form each dimension (for the physical dimension there will be elements like pain, vomiting, functional disability, among others).

The QOL of a population depends on the living conditions of its inhabitants, on whether or not they have access to certain economic and social goods and services like employment, a wage, basic education, adequate food, the access to good health services, basic sanitation, good housing conditions, good quality transport services, among other factors.

It is important, in this context, to stress that the concepts of well-being and of QOL vary from society to society, in accordance with each culture (Silva, 2011). The same author points out that each person is unique and that his/her needs vary. This uniqueness will influence the opinion that each one of them have about what is really significant in their lives and what are their priorities,

Beckert, Irigaray and Trentini (2012, p. 235) define QOL as "a dynamic interaction between the external conditions of an individual's life and the internal perception of these conditions". The same authors also mention that QOL relates to the way people live, feel and understand their everyday lives. It includes aspects such as health, education, transportation, housing conditions, work and the individual's capacity to take part in decisions, in different contexts and situations. It can be perceived as a range of meanings and states: the physical, mental, psychological, emotional and social well-being (family, friends, health, education, among others); the emotional state, the social interaction, the intellectual activity, self-care, family support, health condition, cultural and ethical values and religiosity, lifestyle, satisfaction with our job and/or with daily activities and the environment in which one lives. Thus, it is a concept that varies from author to author, because of its subjectivity, and that depends on each person's socio-cultural level, age group and personal aspirations (Beckert, Irigaray & Trentini, 2012).

According to Diniz and Schor (2006), references to QOL in a clinical discussion are natural and necessary, but, since the concept may be used in many senses, its use can cause some confusion, and that is why some distinctions must be made: a) the judgment of what is a poor QOL can be done by those who live it or by an observer. It often happens that lives that observers consider to be of poor quality are quite satisfactory for those who live them; b) a poor QOL can generally mean that the patient's experiences fall short of the individual's desirable standards; c) The assessment people do of their QOL, as with life itself, changes over time; d) This evaluation may reflect certain bigotry and prejudice; e) The assessment can reflect socio-economic conditions rather than the life experienced by the patient.

There are some objective criteria we can use to define the QOL, namely:

- a) Restricted QOL-it is an objective and appropriate description of a situation in which a person suffers from serious physical or mental health problems, in other words, the patients' functional capacities do not fall within the definition of "human normalcy". This judgment can be carried out by the person who is living that situation or by others who observe that person. It is quite clear that the assessment performed by the observer and the judgment carried out by the person who is living that kind of life may differ;
- b) Minimum QOL – it is an objective description adapted to a situation in which a patient or an observer (a nurse or a family member) faces a person whose overall physical situation has considerably worsened, whose ability to communicate with others is severely restricted and who suffers from discomfort and pain;
- c) QOL below the minimum – it is an objective description that stands for a situation in which the patient exhibits extreme physical weakening and a complete and irreversible loss of sensory and intellectual activity. It may even be suggested that in this state patients have no QOL whatsoever. This description applies to people who are in a persistent vegetative state (Diniz & Schor, 2006).

Cannavarro, Pereira, Moreira and Paredes (2010) claim that there are two different types of instruments that can be designed and used to assess QOL: general and specific instruments. We apply general instruments to obtain values that are not specifically related to a single kind of problem or disease. Those instruments will provide results that will be used to compare the overall health status of two different groups of medical subjects. The specific instruments are less comprehensive. They will only be useful to describe dimensions that involve a specific disease or problem and will be relevant when we compare patients whose specific characteristics are the only factor that matters to define the final output.

Noronha, Martins, Dias, Silveira, De Paula and Haikal (2016), based on the Heath definition provided by WHO, claim that QOL should be analysed and understood according to four different domains: occupational and physical functioning; psychological state; social interaction and somatic sensations. On the other hand, the same authors state that HRQOL (Health-Related Quality of Life) can be met when the individual experiences satisfactory functionality in three main domains: physical, psychological and social.

As far as the physical domain is concerned, someone who suffers from chronic pain is unable to carry out most of his regular daily activities, because his functional capacities will be affected. This situation will also affect the patient's personal fulfilment and his psychological, social and financial well-being. Physical suffering has a significant impact on all areas of a person's QOL (Noronha et al., 2016).

When we focus on the patient's psychological domain, it becomes clear that, in order to adapt appropriately to his environment, and to maintain an excellent QOL, people will need to experience healthy psychological conditions: in situations of anxiety or depression people can hardly get any satisfaction from their daily life and it will be very difficult for them to function properly in any of the domains that will contribute to their QOL (Paschoal 2011).

As for aspects that will have an impact on a patient's social domain, it is clear that in situations where the disease leads to a physical limitation, the patient's role/social status will undoubtedly be affected as he will no longer be able to perform his professional or social activity. In such situations the support provided by family members, friends and health care professionals is fundamental (2011, Noronha et al., 2016).

It is important to emphasize the role played by the perception that each individual has about his or her own health condition or about his/ her well-being, because there is no one better than this individual to express his personal experiences. After overcoming the acute phase of a disease, patients usually go through a process of adjustment to their new life as they look for a lifestyle that can be tolerated and maintained, that allow them to preserve their self-esteem and that is adapted to their limitations, while focusing on other aspects of life (Farias & Martins, 2013). Health is regarded as the largest and best resource for social, economic and personal development and as one of the most important dimensions for QOL. According to Pais-Ribeiro (2009), in health care system, terms like QOL and health condition are usually used almost as synonyms while, on the other hand, Hermann and Looney (2011) consider that these concepts are quite different in essence. The same authors explain that QOL is a much more comprehensive concept than health condition, and that the former is one of the most reliable indicators used to assess the latter. The authors also state that the health dimension has the highest correlation value with the overall QOL scoring, in other words, health might possibly be the most important dimension that will influence a person's QOL.

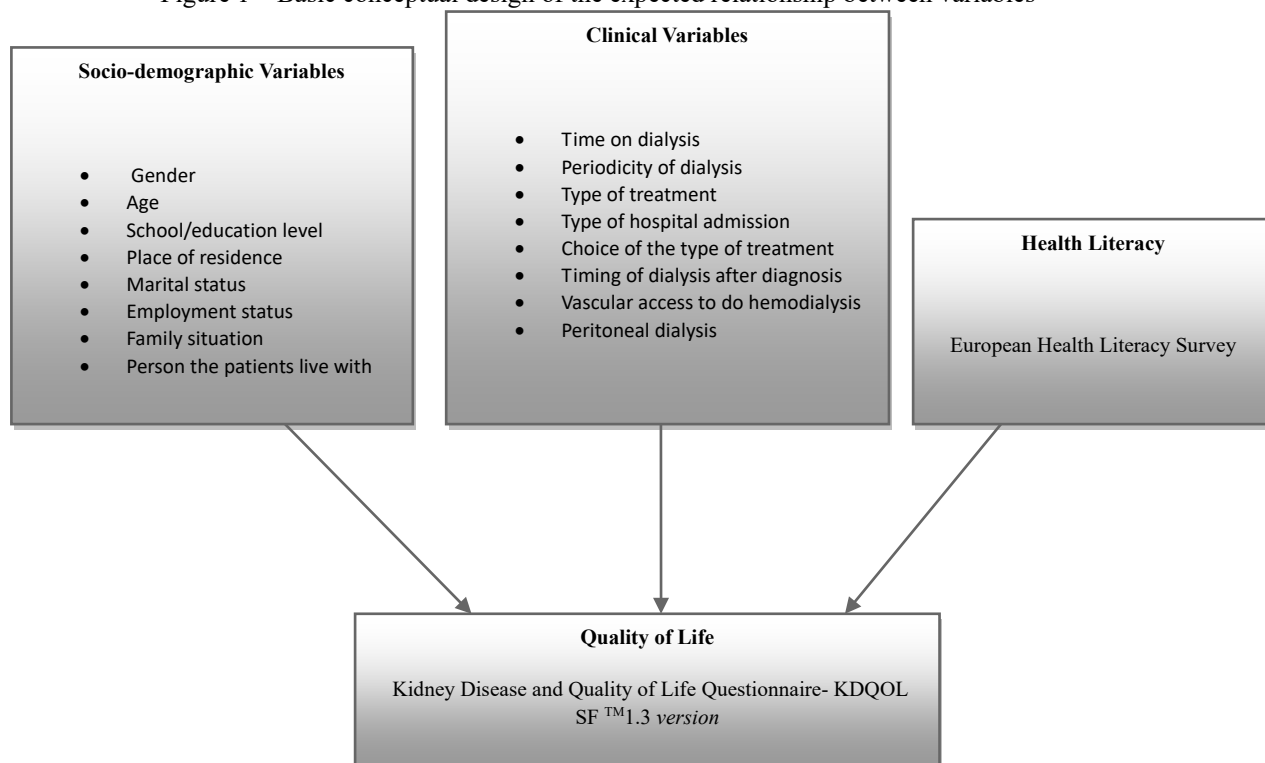

HRQOL has to do with the value people assign to their lives when they are altered by the perception of physical or psychological limitations, when they realize that the disease will have a negative effect on their social functions and life opportunities, when they are affected by the treatments they have to undergo and by situations in which the worsening of the disease is evident. Therefore, HRQOL has become the primary indicator to assess the result of different types of interventions (Serra, 2010).

Diseases that do not disturb the patients' well-being are rare, most of them have a negative impact on the way patients are able to carry out their everyday life activities and on the way their social roles will be performed (Serra, 2010). Chronic diseases require external social and material resources. "The disease is a personal experience, a reality experienced by the individual himself. The perception that each of us has of the disease depends on psychological and social variables that will determine the individual peculiarities that will influence the way each of us will face the disease "(Martins, 2002, p. 34).

The Study

This is a cross-sectional, descriptive and correlational study, since our objective is, in addition to carrying out the analysis and description of the relationships between the variables, to analyze and explain the relationship between those variables. The articulation between the variables included in the current study is shown in a schematic representation (cf. Figure 1)

Figure 1 – Basic conceptual design of the expected relationship between variables

The sample used for this study consists of 100 patients with kidney failure who were undergoing dialysis in a Hospital Centre and in a Medical and Dialysis Clinic. The instruments applied are described in Figure 1.

As far as the participants' socio-demographic data are concerned, the analysis of the results presented in table 1 reveals that the patients with higher representativeness in the sample are elderly people (70.0%) and that 75.0% of the participants are male and 63.6% are female patients.

Through the analysis performed on the participants' school level data, according to their gender, it is clear that more than half of the sample (81.0%) had left school as soon as they completed elementary school (4 years). 80.4% of them are men and 81.8% are women. 11.0% of the patients surveyed had completed middle school (5 to 9 year).

Most of the participants (56.6%) are living in rural areas, but there is also a high percentage of them who are living in urban environments (43.4%). 56.4% of the patients who claimed to be living in the countryside are men and 56.8% are women.

As for their marital status, more than half of the elements of the sample (71.7%) have a partner. 72.7% of the elements of that specific group are men and 70.5% are women. Data made it clear that 28.3% of patients that were part of the sample did not have a partner at the time of the interview.

As far as family composition is concerned, we could observe that the majority of the sample (94.0%) don't live alone. 92.9% of those group members are men and 95.5% are women. Patients who live with someone (N = 94) were asked about the person they were living with. Most of them (66.0%) live with their wives/husbands (71.2% of them are men and 59.5% women), while 17.0% live in the company of their children and 13.8% were living with another person.

Table 1- Sociodemographic characterization of the sample according to the participants' gender.

Variables	Male		Female		Total		Residual		X ²
	N° (56)	% (56,0)	N° (44)	% (44,0)	N° (100)	% (100,0)	1	2

Other(s)	7	13,5	6	14,3	13	13,8	-,1	,1	

As far as health literacy is concerned, data from table 2 clearly show that most patients have low health literacy (93.0%). When the analysis of the results is done according to the patients' age, evidence shows that most of the patients who exhibit inadequate health literacy are elderly people (68.8%). However, the percentage of adult patients with inappropriate health literacy is also quite expressive (31.2%). It turns out that 5 elderly elements (83.3%) present problematic health literacy and only one elderly person (100.0%) shows sufficient health literacy.

After analyzing the results according to the participants' school level, we realised that the majority (80.5%) of the patients who exhibit inadequate health literacy belong to the group of those who had left school early, right after completing elementary school (who have spent 4 or less years at school).

Those who have left school after completing middle school (and who have, therefore, spent between 5 and 9 years at school) came right after (11.8%). When we analysed the cases of patients with problematic health literacy, evidence showed that 5 of them (83.3%) had completed elementary school. The only patient who reveals sufficient health literacy belongs to the group which includes participants with lower school education (table 2).

Most of the patients who show inadequate health literacy live in a rural environment (54.3%), while the remaining 45.7% live in urban areas. All the patients who exhibit problematic health literacy live in rural areas (n = 6; 100.0%) and the only patient with sufficient health literacy comes from an urban environment (table 2).

Taking into account the results about the participants' health literacy according to their marital status, evidence shows that most patients with inadequate health literacy (70.7%) have a partner, while 29.3% did not have a partner at the time the study was conducted. All patients who reveal problematic health literacy (n = 6; 100.0%) have a partner and the only patient who shows sufficient health literacy had no partner at the time (table 2).

It is clear that most of the patients with inadequate health literacy (53.8%) are male, which shows that 46.2% of the female patients also reveal inadequate health literacy. The data gathered also prove that 5 male patients show problematic health literacy (83.3%) and that the only patient who has sufficient health literacy is also a man (table 2)

Table 2 – Health Literacy according to patients' socio-demographic variables.

Health Literacy Variables	Inadequate		Problematic		Sufficient		Total		Residual	
	n° (93)	% (93,0)	n° (6)	% (6,0)	n° (1)	% (1,0)	n° (100)	% (100,0)	1	2

Total	93	100,0	6	100,0	1	100,0				

As for the inferential analysis, the main results show that men reveal higher mean values in dimensions such as cognitive function, the quality of social interactions, of sleep, of the social support they get, of overall health, of their emotional function and vitality, while women reveal better QOL in dimensions like the perception of the symptoms/problems caused by the disease, the impact of kidney disease on their daily life, the level of burden imposed by renal failure, the quality of the professional activity they have been able to carry out, the kind of encouragement they get from the people working in the dialysis centre, the quality of their physical function and physical performance, the fact that they have been experiencing less pain, better emotional performance and better social function.

As far as age is concerned, we found out that adult patients reveal better QOL in dimensions like symptoms/problems, in relation to the impact renal disease has on their daily life, on their professional activity and on the quality of their social interactions. They also state that they get great encouragement from the staff working at the dialysis centre, that they have a better perception of their QOL in relation to their physical performance, to the level of pain they are experiencing and to their emotional and social function. In turn, elderly patients manifest a better perception of QOL in dimensions that have to do with the burden of the disease, with better cognitive function, better sleep, positive social support, greater sense of achievement, positive physical function, better perception of their overall health and of their emotional function and greater vitality.

Conclusions

As far as health literacy is concerned, it has been discovered that most of the patients reveal inadequate health literacy, a finding which is in accordance with the results found by Almeida, Silva, Gaspar and Fonseca (2014) whose research reveals also a higher percentage of patients who present inappropriate health literacy. Those patients are specially adults and elderly people and patients with lower school levels, as shown by the results of the current study, since the vast majority of patients with inadequate health literacy have a low level of education (they left school after completing their elementary education) and are elderly citizens. However, it should be noted that, according to Monteiro (2009), the health literacy profile of a given population cannot be based only on the patients' formal education, since literacy cannot be seen as something that is acquired at a given moment and that is valid forever.

The same author reinforces her position using the assumption that literacy has to be assessed according to any given situation (a disease, for instance) and to the requirements needed to face that problem. It is also necessary to assess the patients' capacity to apply treatment. Health literacy is far from being just a general ability that allows people to read. Nowadays, people often have to face complex health information and therapeutic decisions. To achieve these procedures, patients need to assess the veracity and quality of the information they are given, to analyze the risks and benefits of their decisions, to calculate the doses of medicine they have to take and to interpret some of their test results (Sorensen, 2012; Fernandes, 2012).

The results made it possible to conclude that patients living in rural areas have a better perception of what it takes to have a good QOL in dimensions that have to do with the perception of the symptoms/problems involving the disease, the impact that renal disease might have on their daily life, on their professional activity, the kind of encouragement they receive from the people who work in the dialysis centres, the condition of their function and physical performance, a more positive perception of QOL in relation to the level of pain they were experiencing and to the quality of their social function. Patients living in an urban environment have a better perception of what it takes to have a higher QOL in dimensions that deal with the intensity of the burden caused by the renal disease, with the quality of their cognitive function, the quality of their social interactions, of their sleep, the social support they are receiving, their overall health, their emotional performance and with the kind of vitality they were feeling.

These results reinforce the need for a higher investment in the development of intervention plans to promote health literacy levels among hemodialysis patients, an investment that will surely lead to a better QOL. This suggestion arises precisely because the health promotion actions have to encompass policies that have to take into account the patients' socio-demographic and clinical variables and to allow for the creation of environments that will promote health education and empowerment strategies. This suggestion is also based on the assumption that investment in health literacy implies the use of holistic approaches so that we can develop the patients' capacity to deal with their disease and with the treatment they have to follow and that will improve those patients' QOL.

It should also be noted that HRQOL is associated with higher levels of well-being and patient satisfaction and with a better adaptation to the circumstances arising from that chronic disease and its treatment. Thus, it is imperative that the assessment of the patients' QOL must always be a positive indicator of the kind of health care provided to the patients suffering from renal failure problems, a kind of care that should always be encouraged by the dialysis centres staff. People should always bear in mind that a chronic disease has singular characteristics because of its longevity or because of the certainty that living with a chronic disease will force any patient to adopt choices or behaviours that will enable him to adapt to a new set of challenges and to face the problems that any long-time patient have to go through.

Therefore, the role played by nurses assumes a huge relevance in the improvement of the chronic patients' QOL and it becomes clearer and clearer that, in their daily action, nurses should look at their patient in a holistic perspective, treating him/her like a whole being who is the result of the contributions provided by his social, cultural and psychological dimensions. That way they will play a crucial role in the promotion of their patients' QOL.

In order to improve medical practice, it is crucial to implement better health literacy among patients who are undergoing dialysis, always striving to adapt the medical language to the patients' socio-demographic characteristics and to analyze the context and environments from where the patients are from. It will also be essential to give all the necessary psychological support to each patient, trying to figure whether or not he was provided with the right social support to help him face the whole treatment process. The role played by the patients' family, their involvement in the treatments provided are very important, too, since it is clearly a form of emotional support that will help their loved ones face the hardships caused by their condition.

Abstract

This paper presents a syntactic paradigm resulted from question analysis. The result is to be implemented in an intelligent tutoring system designed for the learners who search for computer technology related information. The paradigm is twofold: 1) a set of augmented predicate argument structure (APAS) frames describing the structures of English sentences forming a question, and 2) the classification of sentence types of answers. The set of APAS frames was initially created based on dependency parsing outputs, focusing on verbs and adjectives and their arguments. It was then complemented by adding another argument, a WH-word included in a corresponding question. WH-words play a crucial role in not only completing a PAS frame, but also fetching appropriate answers from web documents. In addition, some sentence types of answers were found to be mapped to a particular WH-word type from questions. Those types were classified according to their corresponding WH-word. Implementing the resultant paradigm is expected to improve the performance of a tutoring system by providing more suitable answers to the given question.

Keywords: *Intelligent tutoring system, question answering, remote learning, answer patterns, augmented predicate argument structure*

Introduction

Computer assisted learning or e-learning is ubiquitous since various Intelligent Tutoring Systems (ITS) are available to learners anytime and anywhere as long as there is an internet access. ITSs also provide an individual atmosphere for the learners as if they have one-to-one interaction with a private tutor, by which learning quality is naturally expected to increase. Those systems usually represent expertise in specific domains, which guarantees a better performance of the systems. Replacing traditional education methods with such systems involves information and communication technologies. In particular, implementing artificial intelligence techniques such as natural language processing is critical to improve the performance of the applications which use human language as a communication tool or the target of learning itself. Question answering (QA) based systems in particular are widely used as an ITS since such systems support learners' needs by providing only the requested information as well as utilizing human language as a medium to answer the questions. The main task of a question answering system is to automatically find answers to the given questions addressed in a natural language. Question answering can be implemented by adopting one of the two major approaches, information retrieval (IR) based and knowledge-based. The IR-based approach works on the questions to determine the types of answers and to retrieve plausibly relevant passages or documents containing the strings contained in a learner's question. The knowledge-based approach utilizes semantic representations which are frequently mapped to some forms of predicate calculus. It converts learner's queries to a presentations denoting semantic information such as times, locations, entities and numeric quantities. In order to draw satisfying performance of a system, both approaches cannot avoid utilizing linguistics resources which trigger to extract best understanding of the questions. Some of the most commonly adopted linguistic resources list part-of-speech tagging, names entity recognition, parsing, semantic relations and so on. Recently, predicate argument structure (PAS) frames have become popular in building an application utilizing natural language processing techniques. They not only represent the syntactic structure of the questions, but also triggers semantic roles labeling. This research suggests a set of augmented PASs (APAS) to be implemented in an ITS which is designed utilizing a knowledge-based QA approach. The APAS frames are extracted from dependency trees focusing on identifying predicate-argument structures (PAS) of learner's questions relevant to computer technology. Since the APASs are customized not only to a QA mode, but also a specific domain, they are expected to contribute to improving the performance of the system.

Related Studies

An Intelligent Tutoring System aims to improve the effectiveness of tutorials and to boost learners' motivation and confidence. There are three main usages of intelligent tutoring (Brusilovsky and Peylo, 2003). Firstly, it can give students detailed feedback on incomplete or erroneous solutions, helping them learn from their mistakes (Intelligent solution analysis). Secondly, it involves intelligent assistance to help learners reach a solution. This approach adopts the constructivist style of teaching, as used by human tutors, to prompt learners to construct their

own knowledge and to encourage a deeper understanding of a topic (Problem solving support). Lastly it adapts tutoring to deliver learning material in a sequence and style best suited to an individual's needs (Curriculum sequencing). This research adopts the combination of the second and the third approaches since our interests lie on an ITS which is implemented based on a question and answering system.

An ITS is a complex computer system that deals with various heterogeneous types of knowledge, ranging from domain to pedagogical knowledge. The skills needed to implement an ITS are artificial intelligence, machine learning, the cognitive sciences, education, human-computer interaction and software engineering. Researches on ITSs have investigated how to make computer-based tutors more flexible, autonomous and adaptive to the needs of each learner. Those systems are endowed with explicit knowledge of the relevant components of the teaching process and with reasoning capabilities to turn this knowledge into intelligent behavior. There are three types of knowledge that an intelligent tutor (human or artificial) needs to aid student learning: 1) knowledge on the target instructional domain, 2) knowledge on the learner, and 3) knowledge on the relevant pedagogical strategies (Conati, 2009).

ITS researches have successfully delivered the techniques and the systems that provide adaptive learner supports for problem solving or question-answering activities in various domains including programming, physics, algebra, geometry, SQL and introductory computer science (Conati, 2009). Some of the systems are actively used in real-world settings, and have even contributed to changing traditional school curricula (Koedinger et al., 1995).

Question Answering (QA) is the task of automatically providing an answer to a question addressed by a human learner in natural language (Bouziane et al., 2015). QA tasks can be classified into three major ones: 1) Question Analysis, 2) Document Retrieval, and 3) Answer Extraction (Lopez et al., 2011).

Figure 1. Process of QA system (Lopez et al., 2011)

Figure 1 illustrates the three major tasks which QA process requires. Most question answering systems implement these three steps of the process as base modules.

There are two main modern paradigms for question answering (Jurafsky, D. & Martin, J.H, 2017). The first paradigm is called IR-based question answering or sometimes corpus-based question answering. It utilizes enormous amounts of information available as text on the Web. Given a learner question, information retrieval techniques extract plausible passages directly from these documents, relying on the text of the question. The second paradigm is known as knowledge-based question answering and activated by building a semantic representation of a query. The meaning of the query is usually converted to a full predicate calculus statement. There is no reason to limit QA systems to just corpus-based or knowledge-based approach. IBM Watson system (Ferrucci, 2012) that won the Jeopardy! challenge in 2011 is a model example of QA systems that rely on a wide range of various resources to provide answers to a given question. This research focuses on the mixture of both knowledge-based and IR-based approaches in order to enhance the accuracy in finding correct answers and to provide learners with more useful information than the systems performing similar tasks.

QA systems in general are built by implementing a sequence of process steps which are described as follows (Allam and Haggag, 2012):

1. A question is typed into a QA system by a learner.
2. The core meaning of the question is identified by the question analyzer in order to improve the accuracy of the QA system.
3. Classifying the questions influences the performance of the QA system. The questions are categorized depending on the question type and the type of the expected answer.
4. The question is reformulated through rephrasing it. The query is expanded and passed to the information retrieval system.
5. The information retrieval component is used to extract plausibly relevant documents based on important keywords included in the question.
6. The extracted documents are filtered and shortened into a set of paragraphs that are expected to contain the answer.
7. The filtered paragraphs are arranged by order and passed to the answer processing module.
8. A set of candidate answers is identified according to the answer type and other recognition techniques.
9. A set of heuristics is defined in order to detect a word or phrase directly relevant to answering the question.
10. Finally, the extracted answer is validated for its accuracy and then provided to the learner.

Understanding an event at a high level refers to being able to provide an answer to a given question, such as “who did what to whom” and perhaps also “when and where” (Jurafsky, D. & Martin, J.H, 2017). Answers to the question may be addressed utilizing various sentence structures. A set of PAS frames can be one of the solutions to represent various sentences with the same meaning into the same manner. A predicate, usually a verb, requires a set of arguments that play certain roles. These roles can both represent general semantic properties of the arguments and express their likely relation of the predicate with its arguments in the sentence (Jurafsky, D. & Martin, J.H, 2017). These syntactic relations trigger to identify semantic roles which express abstract roles played by the predicate and its arguments in an event.

Recently, research attention has turned to creating corpora annotated with an argument structure for a broader range of predicates. These researches list the Propbank project at the University of Pennsylvania (Kingsbury and Palmer, 2002) and the FrameNet project at the International Computer Science Institute (Baker et al., 1998). They share the goal of documenting the syntactic realization of the arguments of a set of predicates for general English lexicon by annotating a corpus with semantic roles. In addition, Information Extraction (IE) can take advantage of PASs as IE tries to provide the event-level indexing into news stories and television sources (Surdeanu et al., 2003). PASs can be used as the core event presentation of the input sentence. PASs can be extracted from parsing outputs. Dependency parse trees in particular provide semantic relations of subject and object. PAS frames can be extracted by utilizing several different parsers, which results in more accurate semantic relations for each verb (Krestel, Witte & Bergler, 2010). This research extract a set of PAS frames from dependency parse trees, and augment the set by adding more information to improve the effectiveness of the QA system.

Predicate Argument Structures

Predicate argument structure is a mechanism to encode syntactic relations among the constituents of a sentence. The PAS of a sentence specifies a head of the sentence, usually a verb and the set of its arguments which are the obligatory constituents for the sentence to be syntactically grammatical. This notion can be mapped to subject-predicate-object structure suggested by a traditional grammar framework. PAS is known as one of the most compact frames to describe a sentence structure even though adjuncts comprise important parts of the sentence since they convey the meaning left out by the arguments.

Predicate argument structure also provides an interface between semantic and syntactic information of a sentence. On the semantic perspective, it describes the event structure by specifying core participants in an event denoted by the predicate. Syntactic information, on the other hand, includes subcategorization of valence of the predicator which provides the number and the type of the arguments. Figure 2 below presents a dependency tree produced by Stanford Parser (Klein and Manning, 2003a & 2003b) and the PAS extracted from the tree.

<p>Q: How can we <u>catch</u> all kind of exceptions in a single catch block ?</p> <p>A: To handle all exceptions, use Exception class.</p>	
Dependency Tree	PAS
<pre> graph TD catch[catch] --> advmod how[how] catch --> aux can[can] catch --> nsubj we[we] catch --> dobj kind[kind] kind --> det all[all] kind --> nmod exceptions[exceptions] exceptions --> nmod of[of] of --> block[block] block --> in[in] block --> a[a] block --> single[single] </pre>	<p>(catch : nsubj (we) : dobj (all kind of exceptions))</p>

Figure 2. PAS for ‘catch’

The PAS in Figure 2 displays arguments, *nsubj* and *dobj* required by the verb ‘catch’. The core of the question, however, is delivered by WH word, ‘how’ annotated as *advmod* which is supposed to be mapped to an adjunct and never considered as an argument. If only the PAS of a question is referred to retrieve answers, it is very likely to fail to find requested answers, which eventually decreases the performance of the system.

<p>Q: <u>Why</u> do we use MySQL database server?</p> <p>A: The MySQL database server is very fast , reliable and easy to use.</p>	
Dependency Tree	PAS

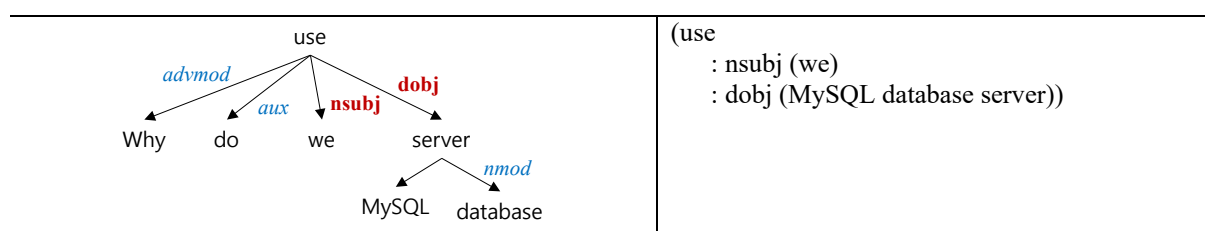

Figure 3. PAS for ‘catch’

Figure 3 presents the PAS of a sentence whose type is identified as WH question led by ‘why’, the core of the question. In the PAS, however, the WH word does not appear since it is not an argument of the verb “use”. Similarly, ‘when’ and ‘where’ are often identified as an adjunct which is also annotated as *advmod* in the dependency parse tree.

Although the predicate and its arguments function as core constituents of a sentence, they cannot represent the full-fledged sentence structure by themselves as shown in Figure 2 and 3. Examining all the adjuncts of a sentence, however, does not seem efficient especially when dealing with domain-specific data which are usually created using a limited number of sentence structures. This research suggests a set of augmented PAS frames to better describe the domain-specific data to be processed in a QA based ITS system.

Question Analysis

Questions and their corresponding answer sentences are collected from Community Question Answering (CQA) services and stored as a QA database. The topics of questions represent mainly computer technology related domains which are most popular in the CQA site.

Sub-domain	Number of QA Pairs
C/C++/C#/Java Programming languages	885
Other Programming languages	1,155
Database	700
Web related	1,217
JavaTech	880
etc.	1,482
TOTAL	6,319

Table 1. Distribution of QA pairs

The distribution of the data shows six types of sub-domains as presented in Table 1. The types of sub-domains include various Programming languages, Database, Web related, JavaTech, and the collection of miscellaneous topics. Programming languages include C/C++/C#, Java, and other languages, which takes up to 30% of the data. Web related questions are the second most popular topic. The total of 6,319 question and answer pairs has been extracted from the data. Question and answer pairs are usually one-to-one mapping in terms of the number of answers per question, but some questions are mapped to a set of answers in which the 19 sentences are found to be the answers to a single question.

The first step to store the QA pairs in the database is to classify the types of question sentences since the questions are addressed utilizing various grammatical mood. The major classes of the resultant classification list interrogative, imperative, and declarative. The rest of the questions are expressed in the form of various fragments including phrases and various types of incomplete sentences such as solely used subordinate clauses. These are excluded in specifying the distribution due to their low frequencies.

Interrogative mood is the most prominent sentence type, followed by an imperative sentence. The least number of sentences is recognized as a declarative sentence. An interrogative sentence is further categorized into two subtypes, WH question and Yes/No question whose answer types are distinctive in their structures. WH question sentences are constructed adopting seven WH words including ‘what’, ‘how’, ‘which’, ‘when’, ‘where’, ‘who’ and ‘why’. Most of the questions are addressed in a full-fledged sentence, and some are composed in a clausal complement.

- 1) How does bitwise operator XOR works?
- 2) How to declare a property in a class?
- 3) Explain the purpose of the keyword volatile.
- 4) If server gets shut down then data stored in Memcached is still available?
- 5) Is FILE a built-in data type?

Example question 1) is addressed in a complete WH question structure whereas example 2) presents a clausal complement where the subject of the sentence is not overtly specified. Question 3) presents imperative mood by

which a request is conveyed. Declarative is the sentence mood in example 4) and it requires the period as its proper punctuation. However, the learners frequently utilize declarative mood to express a question by replacing the period with the question mark.

The next step involves classifying each type into its subclasses. Interrogative sentences are initially divided into WH question and Yes/No question. The former is categorized further according to a WH word included in the sentences. All of seven WH words are used to form an interrogative sentence, and they function as a keyword to extract the requested information as an answer. Yes/No questions are constructed utilizing an auxiliary such as 'be', 'can' and 'do' as presented in example 5). Naturally, the answer to the question is either 'yes' or 'no' which can be expressed with other negation words. Imperative sentences are formed utilizing a set of verbs which list 14 different verbs such as 'explain', 'tell', 'define', 'give', 'list', and so on to request an answer to the question. Unlike the interrogatives, the exclamation mark is either replaced with the period or simply deleted as shown in example sentence 3).

Question Sentence Type		Distribution	Keyword
Interrogative	WH question	87.0% (5,500)	what (3724) how(1091) which (476) why (90) when (78) where (23) who (18)
	Yes/No question	6.16% (389)	can (155) be (133) do (96) would /will (5)
Imperative		6.25% (395)	explain (240) name (41) define (32) write (30) give (17) list (12) etc. (23)
Declarative		0.5% (35)	

Table 2. Data Distribution

Table 2 summarizes the subclassification of the data. WH-question is overwhelming majority, 87% of the questions presented in a complete sentence. Among the WH words, 'what' is most frequently selected to address a question. The usage of another WH word 'which' is similar to that of 'what', but its appearance is much less frequent although it is also used as a modifier of a noun. Imperative sentences are the second most frequently occurring mood type as they replace interrogatives, utilizing a set of verbs as listed in Table 2. Learners seem to prefer addressing a question in an imperative sentence since it is constructed with a simpler structure than an interrogative and accordingly saves some typing efforts.

When database construction is completed, question sentences are parsed using Stanford Parser which produced both phrase structure trees and dependencies. Figure 4 displays the process outline to be implemented in a system.

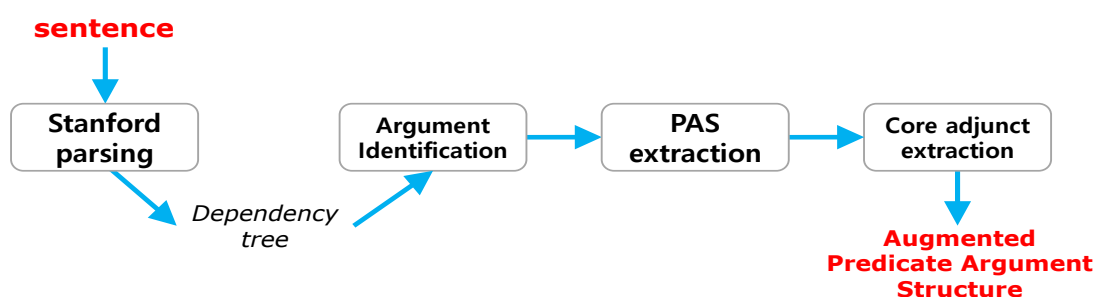

Figure 4. Process of Extracting APAS

This research has chosen dependency parse trees over phrase structure (PS) trees since they represent the relations among the constituents and their associated predicates. Dependency trees are derived by applying dependency grammar rules and simpler in hierarchy than the PS trees. The trees describe the structure of a sentence utilizing actual words included in the sentence rather than adopting an abstract symbol to label the nodes in the trees. The words are represented with directed grammatical relations held among themselves, from which the arguments of the predicator can be identified.

PA structures have been extracted from dependency parse trees by examining resultant annotations and mapping them to the arguments of the sentence. Since the canonical PAS does not provide enough information to find appropriate answers as explained with Figure 1 and Figure 2, core adjuncts used for more specifically describing sentence structures are identified and added to the PAS. Since WH question sentences are the majority type of the data and some of the WH words are parsed as an adjunct, properly identifying the roles of WH words is expected to enhance the system performance in finding answers.

This research focuses on analyzing WH words which do not occur as an argument, but an adjunct in general. Those include 'how', 'why', 'when', 'where', and 'why'. They are added to a PAS frame according to their role, either a core adjunct or an argument that is missing from the frame. The rest three, 'what' who' and 'which' are considered as an argument which appears in existing PAS frames although 'which' as a modifier is ignored. This

resultant augmented PAS presents not only the arguments of the predicate, but also a WH word as an additional argument which plays a key function to describe the structure of the question sentence.

Q: Why is a covered query important?

A: Since all the fields are covered in the index itself, MongoDB can match the query condition as well as return the result fields using the same index without looking inside the documents.

Dependency Tree	APAS
<pre> graph TD important --> advmod Why important --> cop is important --> nsubj query query --> det a query --> amod covered </pre>	<pre> (important : nsubj (a covered query) : why ()) </pre>

Figure 5. APAS for ‘important’

A sole canonical argument of the question is identified as *nsubj* to the predicate, ‘important’ in Figure 5. Compared to a PAS such the frame in Figure 3, a WH word, ‘why’ is recognized as an argument conveying the requested information expressed in the question. When it is included in APAS, the lemma, *why* replaces the dependency annotation *advmod* as the core adjunct which is crucial to find relevant answers.

Q: How can you create a form in MS Access 2013?

A: Here are a lot of methods **for creating** forms but with Form Wizard method, you can always modify the form later using Design View.

Dependency Tree	APAS
<pre> graph TD create --> advmod How create --> aux can create --> nsubj you create --> dobj form form --> nmod a form --> nmod 2013 a --> in 2013 --> MS 2013 --> Access </pre>	<pre> (create : nsubj (you) : dobj (a form in MS Access 2013) : how ()) </pre>

Figure 6. APAS for ‘create’

Another WH word, ‘how’ in Figure 6 triggers the requested information necessary to create a form in an application, MS Access. Although the sentence is considered syntactically grammatical with its PAS frame containing all the arguments identified, correct answers cannot be retrieved without interpreting ‘how’, the core adjunct. It specifies the core of the question, the manner by which a form is created. Its annotation in the dependency parse tree is also *advmod* identical to that of ‘why’, which is substituted with its lemma filling an argument slot to complete the APAS frame for ‘create’.

Q: In how many ways you can pass parameters to a method?

A: There are three ways that parameters can be passed to a method – Value parameters – This method copies the actual value of an argument into the formal parameter of the function.

Dependency Tree	APAS
-----------------	------

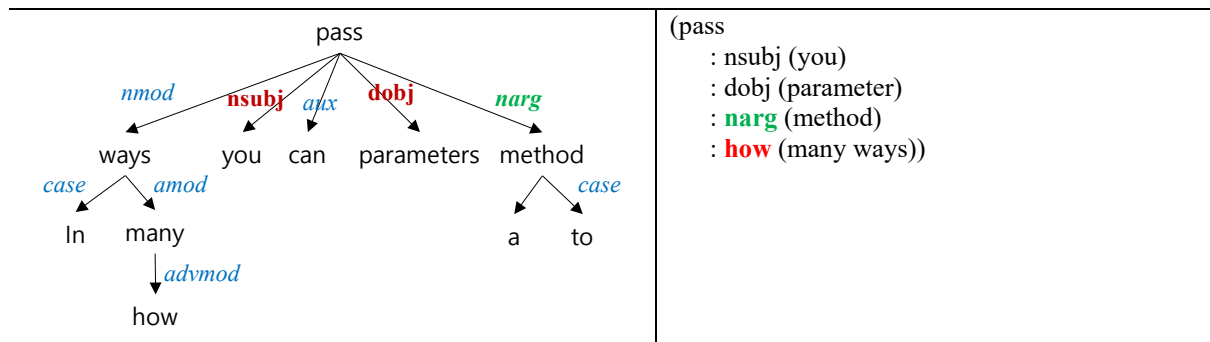

Figure 7. APAS for 'pass'

Stanford parser sometimes parses an argument as an adjunct because it does not consider subcategorization information carefully. The verb 'pass' requires three arguments to be both syntactically and semantically grammatical when it has to be interpreted as a particular sense as in Figure 7. This study suggests an augmented PAS frame in which the missing argument, *narg* is correctly recovered. Another argument added to the frame is a WH word 'how' which functions as a specifier to an NP 'many ways', but it plays a key role to find appropriate answers to the question. As a result, the system can properly retrieve the requested information.

Q: How to sort an array in C#?

A: Using Array.sort(array) function.

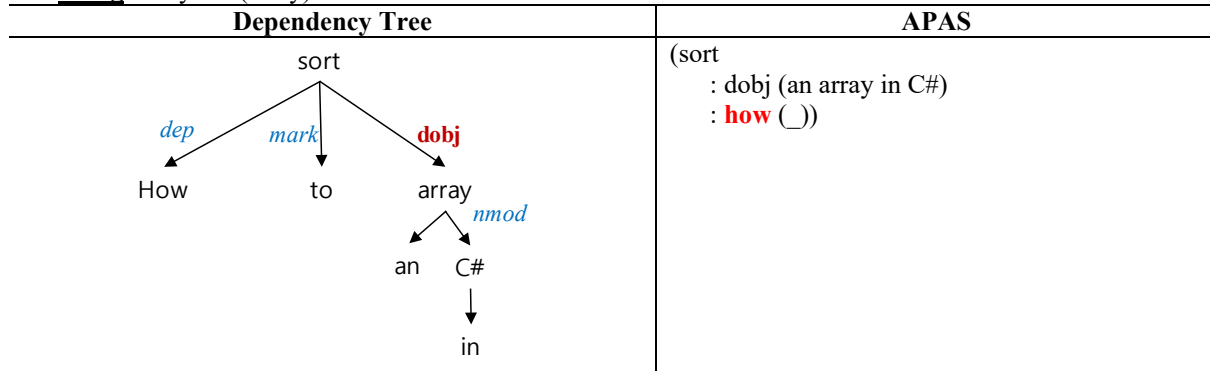

Figure 8. APAS for 'sort'

Figure 8 presents a question constructed in an incomplete sentence, a clause which functions as a complement. This clause is initially parsed to identify the head and its arguments. A single argument is identified as *dobj* to the predicate, 'sort'. What the learner has inquired is the manner of sorting an array, which is represented using a WH word 'how'. This research identifies 'how' as a core adjunct and adds it to the PAS frame of 'sort'. Although 'how' in the parse tree is annotated as *dep* which does not represent an overt dependency, the APAS frame lists it as *how*, by which a QA system benefits from the ASPA to find appropriate answers.

Q: When should exploratory testing be performed?

A: Exploratory testing is performed as a final check **before** the software is released.

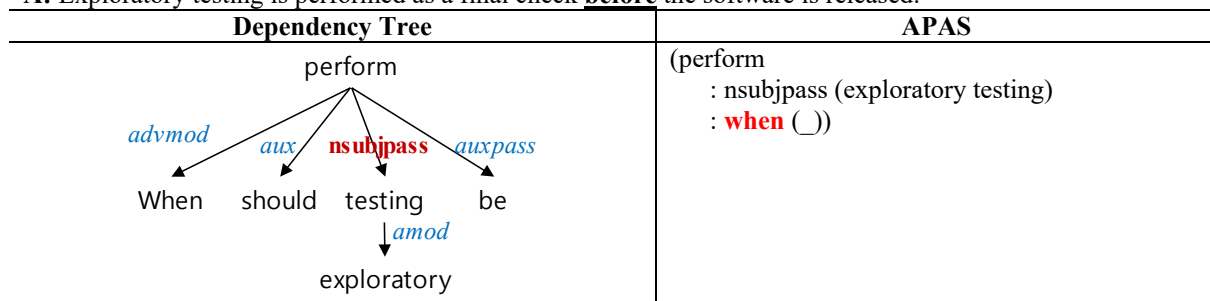

Figure 9. APAS for 'perform'

The predicate of the question, 'perform' in Figure 9 does not require a time expression to satisfy grammaticality. A WH adverb 'when' is parsed as an adjunct annotated as *advmod* which is excluded from a canonical PAS frame. Without recognizing the WH-word, the system cannot provide the answers that the learners have expected. The augmented PAS frame now includes *when* as a required constituent to satisfy the need of the learners.

Q: <u>Where</u> is an automatic variable stored? A: Every local variable by default being an auto variable is stored <u>in</u> stack memory.	
Dependency Tree	APAS
<pre> graph TD store --> advmod Where store --> auxpass is store --> nsubjpass variable variable --> amod an variable --> amod automatic </pre>	(store : nsubjpass (an automatic variable) : where ())

Figure 10. APAS for ‘store’

Another WH adverb ‘where’ in Figure 10 is also parsed as *advmod*. Unlike the predicate in Figure 9, the verb ‘store’ requires an adverbial phrase referring to a location along with direct object tagged as *dobj* to be syntactically correct although *dobj* is missing from the frame since the voice of the question is passive. Adding *where* to the PAS frame not only satisfies subcategorization constraints of the predicate, but also provides a crucial clue to find the requested information.

Conclusion

This research has suggested a set of augmented predicate argument structures customized for an Intelligent Tutoring System which deals with domain-specific data. The system is designed to answer to a question related to computer technology domain. The total of 6,319 Question-Answer pairs has been collected and analyzed. The types of question sentences were initially classified as interrogative, imperative and declarative followed by subclassification of the interrogatives into WH-question and Yes/No question. These sentences are analyzed to identify their syntactic structures utilizing dependency parsing and predicate argument structures. An initial PAS frame has been extracted from the dependency parse tree produced by Stanford parser. The resultant set of PAS frames has been examined and augmented to complement missing information. Since the PAS frames often did not contain required information, they were augmented by recovering missing arguments according to subcategorization of the predicate and identifying core adjuncts which are not arguments but necessary constituents to detect the requested answers. While working on analyzing the data, a set of keywords have been detected to find appropriate answers. For example, a question formed using ‘how’ is usually mapped to sentences with a set of keywords or a particular sentence type. Answers are usually delivered in a declarative sentence containing “by verb+ing” or “to infinitive”. Another sentence type is imperative which begins with a verb or ‘you’ presenting emphasized imperative. Identifying such information from the answers is also expected to improve the accuracy of finding answers.

The next step of the research will be implementing the augmented PAS frames in a QA based intelligent tutoring system. Since the frames are customized for correctly analyzing the structure of question sentences, it is expected to enhance the system performance of the system. Furthermore, the APAS framed with minor revision can be used in similar type of question-answering based tutoring systems which deals with the data of similar domains.

Abstract

Original reasoning rational remains by means of aim toward reason. Triggering the expressive control of enchanted then unknown (cutting-edge additional arguments original reasoning) remains unique of the newest then influential tendencies cutting-edge occupational university teaching. We stretch now happening an examination of the organizations aimed at original reasoning have enough money toward occupational university scholars. This education usages the perfect industrialized through Lithner (2008) which distinguishes amid derivative reasoning which remains connected toward repetition knowledge of procedures then ideas, then original reasoning which includes reasonable mathematically originated influences. The examination includes the inspection of minutes, projects then inspections rummage-sale cutting-edge rudimentary mathematics then accounting course cutting-edge Accounting Department of Kocaeli College Kocaeli occupational university by the opinion toward categorizing the kinds of reasoning predictable of the scholars. By way of healthy by way of explanation our usage of lithner's technique, we deliberate his appropriateness by way of a instrument aimed at categorizing reasoning chances cutting-edge communal discipline department's mathematics course. Development in educational works of participants apply of rational suggestions supports the study's style work on the data

Keywords: vocational school, mathematical reasoning, accounting department

Introduction

School applications of participants math showing a positive effected theoretical background of math demonstrating, detailing registering skill in math, for more powerful presentation of the various features of participants skills in math demonstrating. The supplementary way involved participants estimation of math evidences and rational learning of various proof methods (Bhaird, C., Nolan, B., O'shea, A., & Pfeiffer, K. 2008; Alcock & Weber, 2005; Antonini & Mariotti, 2008; Harel & Sowder, 1998; Selden & Selden, 2003; Stylianides & Stylianides, 2009). The above mentioned writing restricted actions of reason exercise, moreover, didn't discover the use of numerical examples as an alternate of reasonable exercise not the power of this teaching on participants justification of math evidences and rational information of various evidence methods (Bhaird, C., Nolan, B., O'shea, A., & Pfeiffer, K. 2008; Deer, 1969; Durand-Guerrier, 2003; Epp, 2003; Mueller, 1975; J. L. Platt, 1967). Lithner (2008) describes reasoning by way of 'the streak of supposed accepted toward crop declarations then spread deductions cutting-edge job (problematic)-solving'. This meaning consumes together tall then low-quality influences then remains not lone limited toward official evidences of propositions.. Lithner distinguishes amid derivative reasoning which remains connected toward repetition knowledge then imitation of procedures then original reasoning which includes reasonable mathematically-founded influences. Cutting-edge this education, he remains practical this outline toward categorize the reasoning chances obtainable cutting-edge a variety of commercial mathematics obtainable cutting-edge Nigde Ömer Halisdemir communal discipline occupational university.

Conceptual framework

Mathematical evidences remain crops of mathematical proving. Though, we usage the period "mathematical showing" cutting-edge this education needed rummage-sale by resistant manufactures (Bhaird, C., Nolan, B., O'shea, A., & Pfeiffer, K. 2008; Harel & Sowder, 1998; Weber, 2001). in order to categorize the proof-related skills that we describe in the future units, evidence information. The other skills had been planned as vital for participants evidence and verifying (Bhaird, C., Nolan, B., O'shea, A., & Pfeiffer, K. 2008; Görentaş And Yıldız, 1999; Yıldız And Görentaş; Alcock & Weber, 2005; Selden & Selden, 2003). The original reasoning organization container remain alienated hooked on binary subgroups (Dreyfus, 1991): native creative reasoning; then worldwide original reasoning. A problem set remains accepted "need native original reasoning" doubt he remains soluble by means of any procedure nonetheless the it wants toward be modified by the procedure nearby. A problem set remains accepted "need worldwide original reasoning" doubt he fixes not consume a answer that remains founded happening any procedure then needs original reasoning (Bhaird, C., Nolan, B., O'shea, A., & Pfeiffer, K. 2008; Tola At All, 2017). Lithner (2008) notes a reasoning application imaginative when that has the next main types:

- i. *Novelty. A new reasoning sequence is applied*
- ii. *Plausibility. Applying of opinions is necessary to support strategy implementation. It motivates students to think that the inferences are true or not*
- iii. *Mathematical basis. Background level of student's determinate the accomplishment of the strategies*

Method

This research method confirms dependability of the verification of the lecture elements from the various modules. We first made the examination through categorizing movements after model, cutting-edge instruction toward gain approximately knowledge then toward deliberate then decide happening our organization approaches. These events remain cutting-edge streak by persons obtainable through Lithner (2008). Lithner primary concept an answer toward the job then formerly likened toward the lecture minutes then model instances. By means of Lithner's outline, we choose whether the job might remain resolved by means of algorithmic reasoning before whether original reasoning remains wanted. We originate that the greatest problematic choices worried the organization of errands hooked on the local creative reasoning or global creative reasoning groups, then consequently we set the outline as the method that: we first define that we would categorize a problem by way of local creative reasoning doubt the local creative reasoning remained founded happening an procedure, nonetheless scholars needed toward confirm the problem in subgroups (Bhaird, C., Nolan, B., O'shea, A., & Pfeiffer, K. 2008).

Analyses and findings

We current approximately instances of errands secret by means of the Lithner reasoning outline. We distillate happening unique theme cutting-edge instruction toward remain intelligible then toward remain healthier talented toward liken groups. We reflect the theme of lucid reckonings, which remains significant cutting-edge numerous rudimentary mathematics course. Cutting-edge the sequence cutting-edge query, the talk minutes then the model deliberate answers of lucid reckonings by means of the quadratic formulation by way of healthy by way of factoring then stretch instances which exemplify together approaches.

Question 1: solve the following rational equations, give your answers with various format if it is possible.

- (a) $x^2 - 9x + 20 = 0$;
- (b) $x^2 - 2x - 2 = 0$;
- (c) $2x^2 - 50 = 0$;
- (d) $x^2 - 18x + 81 = 0$;
- (e) $x^2 + 2x + 2 = 0$;
- (f) $x^2 - 10x + 170 = 14x + 30$.

Analysis of the parts of the question:

In this question, students are expected to use the quadratic formula or factorization of the rational equations.

- A) $x^2 - 9x + 20 = (x - 4)(x - 5)$, than the solutions are $x = 4, 5$;
- B) by using of the quadratic formula of rational equations, than the final step of the solution is $x = 1 \pm \sqrt{3}$, with other expression, $x = 2.732$, and $x = -0.732$;
- C) $2x^2 - 50 = 2(x^2 - 25) = 2(x - 5)(x + 5)$, so the solutions are $x = -5, 5$;
- D) $x^2 - 18x + 81 = (x - 9)^2$, so there is just unique solution at $x = 9$.
- E) using the quadratic formula we have $x = -1 \pm \sqrt{-4}$, so there are no real solution;
- F) subtracting $14x + 30$ from both sides gives $x^2 - 24x + 140 = 0$ and since $x^2 - 24x + 140 = (x - 10)(x - 14)$, the solutions are $x = 10, 14$.

Result

He remains energetic the growth of rudimentary capabilities such by way of original reasoning of scholar that brand influential then hard their appointment cutting-edge the teaching procedure. Cutting-edge this newspaper, his rummage-sale and examination of the organizations aimed at original reasoning have sufficient cash toward occupational university scholars. The examination of altogether queries aimed at the various course consumes not remained obtainable cutting-edge this education. Therefore, we don't stretch filled deduction of the sizes of queries cutting-edge apiece group (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008).

davutyildirim@ohu.edu.tr

Abstract

The role of participants' logical reasoning in learning math and accounting has transferred to educational study area recently (Durand-Guerrier, 2003; Selden & Selden, 2003) creative reasoning thinking is using motive to think. We give here on an analysis of the organizations for creative reasoning applied to vocational school participants. This study uses the model developed by Lithner (2008) that distinguishes between derivative reasoning that is connected to rote education and imitation of algorithmic operation and inspired reasoning that includes reasonable math created opinions. The analysis includes the investigation of notes, assignments and examinations applied in basic math and accounting lecture in social science department of Niğde Ömer Halisdemir Social Science Vocational School with the opinion to organizing the kinds of reasoning anticipated of the participants. Moreover, explaining our use of Lithner's method, we discuss its suitability as an instrument for organizing reasoning occasions in social science department's math and accounting lecture (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008).

Keywords: vocational school, math reasoning, social science department

Introduction

Instructive applications of the power of activating practical reasoning on participants' skills in math showing didn't yield solid wanted profits (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008; Durand-Guerrier, 2003). Lithner (2008) defines reasoning as *'the line of thought adopted to produce assertions and reach conclusions in task (problem)-solving'*. This explanation has both high and low-level advices and is not limited to verifications of propositions. The context is useful in learning the thinking procedures desired to solve problems in basic math and accounting lecture, that proofs aren't given but participants are anticipated to make reasonable influences and decisions. Lithner categorizes between imitative reasoning that is linked to rote education and imitation of procedures and creative reasoning that includes practical math-shown opinions (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008). In this study, it is used this context to categorize the reasoning occasions obtainable in a variety of business math offered in Niğde Ömer Halisdemir Social Science Vocational School. We are considering both lecture for specialist and non-specialist participants, as well as compulsory and non-compulsory components in this program.

According the education researchers, transition from high school (or college) to university is widely recognized as a difficult procedure and participants usually think that the move in math and accounting lectures (physic and chemistry) is usually difficult and problematic (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008; Kahraman at all, 2018). Participants' difficulties in first year coming from notional approach rather than concrete presentation of math teacher (Fucawa-Connelly, 2005). Participants' difficulties are specially with the notions as complex numbers, special function, derivate, derivative, and deeply analyzing of definition of these notion and the long and abstract proofs (Görentaş and Yıldız, 1999). These basic notions of university math are also widely used from the participants including the department such as engineering, physic, biology, some social programs. It is a recognized and accepted math realty that the study of math be powerful step by step with the progress of abstract thinking skills, and the one of the basic purposes of math education is to teach math reasoning (Clark and Lovric, 2009). Diagnosing that participants' use of reasonable insinuations is fundamental to the verifying. This study aims to analyse how logic instructions with an obvious stress on concrete examples might support participants advance the reasoning of reasonable insinuations and skill in math activity (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008).

Framework of the study

Math proofs are crops of math evidencing. Moreover, we use the concept "math proving" in this study had used with proof creations. To categorize the other proof-related skills that we explain in the next 5 sections, proof information. These two other skills had been planned as vital for participants' proof and proving (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008; Selden & Selden, 2003).

In this study some kind of questions will be participants' labor material counting work problems. Lithner (2008) clarified differences between imitative and creative reasoning. Imitative reasoning has two basic forms: "memorised and algorithmic". In order to be modulated as memorised a reasoning procedure should have complicated the following point (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008; Lithner 2008):

- i. *"the tactic choice is examined on concentrating a complete answer"*
- ii. *"the tactic application wants to have only the registering"*

Method

In this study, we used model questions from mathematics and accounting lecture of social science department of the vocational school. The lectures include four business math modules. These four modules are created from the math and accounting lecture offered to participants. The data in this study involve of the next type models: lecture notes, math books, assignments, examination questions. We got all the information with the collaboration of the module lecturers. The data analysing of each module is being showed by the author of this article (Bhaird, C., Nolan, B, O'shea, A, & , Pfeiffer, K. 2008).

This research method confirms consistency of the analysis of the lecture material from the different units. We first made the analysis by categorizing exercises from math book, to increase some practice and to argue and decide on our organization approaches. The processes are the same way with the offered by Lithner (2008) and Norqwis, (2016). Lithner build a solution to the papers and associated to the lecture notes and math book samples. By means of Lithner's context, we focus the questions that the papers would be answered by algorithmic reasoning or creative reasoning is required. We showed that the challenging choices connected to the organization of questions to the local creative reasoning or global creative reasoning categories, and so we set the framework as the way that: we first define that we would classify a problem as local creative reasoning if the local creative reasoning was founded on an algorithm, but participants had to confirm the problem in subgroups. We determined to classify a problem as global creative reasoning if two or more parts were necessary (Norqwis, 2016; Bhaird, C., Nolan, B , O'shea, A, & , Pfeiffer, K. 2008).

Analyses and findings

In this section we will present some examples of questions categorized by the Lithner reasoning framework. We focus on one issue to be comprehensible and to able to relate groups. We think the subject of rational equations, which is important in basic math and accounting lecture. In the lecture in question, the lecture notes and the math book oriented solutions of rational equations expending the quadratic formula and operating and give examples that explain with two methods (Bhaird, C., Nolan, B , O'shea, A, & , Pfeiffer, K. 2008).

Question 2: write the solutions to the next equation:

$$(x - 5)(x + 3)(1 - x) = 0.$$

Analysis of the question:

$$(x - 5)(x + 3)(1 - x) = 0, \text{ we conclude that } x = 5, -3, 1.$$

This question is a creative reasoning model, precisely it is a local creative reasoning task. The participants could use the factor algorithm from the mathematics course documents or the math book. Moreover students want to settle it to the three components (Norqwis, M. 2016; Bhaird, C., Nolan, B , O'shea, A, & , Pfeiffer, K. 2008).

Analysis of the question:

It is clear that the method in this task is an imitative reasoning work, explicitly it is an algorithmic reasoning study. The participants should to practice the algorithms from the course notes or from the math book suggested by the math teacher in the vocational school (Norqwis, M. 2016; Bhaird, C., Nolan, B , O'shea, A, & , Pfeiffer, K. 2008).

Question 3: one solution of the rational equation

$$x^2 - 7x + m = 0$$

Is known to be $x = 3$. Find the other solution.

Analysis of the question:

Since $x = 3$ is a solution, we can see that

$$3^2 - 7.3 + m = 0, \text{ then } m = 12.$$

By using of this value, we can solve $x^2 - 7x + 12 = 0$ using the factor model to get that the other solution is $x = 4$.

This approach is a creative reasoning study, especially it is a global creative reasoning situation. We assume that the lecture notes and math book do not enclose this algorithm or example that the participants can apply it to solve this question. Participants must to generate an original logically reasonable tactic to admit the mark of m (Norqwis, M. 2016; Bhaird, C., Nolan, B , O'shea, A, & , Pfeiffer, K. 2008).

Result

When logical education in all situations improved participants' creative mode of suggestions, the achievement in math verifying are restricted by the explanations of math presentations (Norqwis, M. 2016). In this study, it used an analysis of the organizations for creative reasoning applied to vocational school participants. The analysis of the questions for the different lecture has not been presented in this study. Thus, we cannot give full conclusion of the proportions of tasks in each group. With this question modification, we have not showed any technique in the commit to memory reasoning classification (Bhaird, C., Nolan, B , O'shea, A, & , Pfeiffer, K. 2008).

Reconstructing Pedagogical Reason Withing A Contemporary Reading Of Enlightenment

Carlos De Sousa REIS
Coimbra University
csreis@uc.pt

Abstract

We start by discussing the educational project in the framework of Modernity, Enlightenment and Bildung, while trying to present a critical characterization of its historical emergence, along with the underlying of the innovative contributions and eventual shortcomings. In particular we refer to the substantialist, a priori, solipsistic, and supposedly transcendent conception of the subject, which gave way to a set of insularizing and denaturalizing illusions, along with the monological metanarratives that cloister education. On the positive side, we stress the proposal of autonomous reasoning, free from all tutelage, understood as expressive and conditional of human intrinsic dignity, which leads to a new understanding of the educational process and the foreseeing of a society proactively conjugating human beings as entitled to be considered as “ends in themselves”. It follows an analysis of the postmodern deconstruction by identifying its points of impact, namely, the concepts of reason, truth, discourse and the teleological reading of education. After discussing Postmodernity contributions regarding the appreciation of difference and multiculturalism, along with the refusal of any kind of absolutizing procedures, we also debunk the perplexities and dead ends it has brought forth. After referring to postmodern approaches that rely on the simple parodies of “traditional” philosophy, as well as to the argumentative weakness discovered behind the opaque language of sensationalist effect and the simple unreasonable nature of some of its approaches, we focus on: the tendency to refuse all kind of aims and objectives for education; the proposal of a non-identity pedagogy; the dismissal of imparting all kind of predefined knowledge *corpus* through education; aside with the discard of what is called the “novel of self-formation”, supposedly constructed by Enlightenment to define education as a normative process aimed at propitiating an spurious autonomy at the price of accepting certain social limitations. We conclude by pointing out towards a new Enlightenment or Metamodernity, which could rely on a participatory reason (Herrerías, 2009a) in order to give way to the critical, dialogic and intersubjective reconstruction of the Pedagogical Reason (González, 2010).

Reflective Learning In High-Fidelity Simulation Among Undergraduate Nursing Students

Hao Bin YUAN
Macao Polytechnic Institute, Macao
hbyuan@ipm.edu.mo

Abstract

This paper was to elaborate and analyze the conceptual framework of reflection, the methods of reflective learning in high-fidelity simulation. The foundation and inherent to the reflective processes are knowledge, skills, attitude, experience and emotion. The reflective practice includes the phases of before action, in action, on action and beyond action. 1) Reflection before the simulation includes the orientation to environment and simulator and reflection on knowledge, skills, attitudes, experiences and emotion. 2) Reflection in action: Students are exposed to the simulated scenario and initially determine what is happening with the patient. 3) Reflection on action involves critical self-analysis of the identification of decision points, and acknowledgement of strength and weakness in both skill performance and reasoning patterns. 4) Reflection beyond action: The reflection beyond action is conducted in post-simulation. It includes reflection on performance and reflection on evidence-based practice. Conclusions: The reflective learning in simulation occurs in the concrete experience, active experimentation (debriefing), reflective observation, and abstract conceptualization. Reflective learning can assist the students to enhance their cognitive abilities, and offer students the opportunity to practice their assessment and organizational skills.

Keywords: *Reflection, learning, high-fidelity simulation, nursing*

Introduction

Nursing is a practice profession and active learning by caring for patients always has been the preferred method of achieving competency. The nursing graduates are expected to have mastery of technology and handle diverse situations while providing empathetic, ethical, and therapeutic care to patients and considering patients' unique psychosocial, generational, and cultural characteristics (Birkhoff, Donner, 2010). Although students may have been taught how to make clinical decisions theoretically, they were not always able to link all of the pieces together, nor could they articulate the thinking processes involved. Limited clinical placement and shortened lengths of stay for patients affect opportunities for clinical experiences with real patient care situations. Such constraints affect a nursing student's ability to develop the necessary clinical competence to care for patients. The linking of theory with practice is best attained through reflective learning, in which students are encouraged to focus on problem solving, critical thinking, and teamwork (Nash, Harvey, 2017) .

Patient simulators provide a very realistic situation. Simulation is designed to encourage active participation in the learning process allowing students to construct knowledge, explore assumptions, and develop psychomotor skills in a safe environment (Jeffries, 2008). High-fidelity simulators use software that allows the physiologic parameters to change in response to interventions. It provides a pedagogical link between education and practice, and provides nursing students with the opportunity to analyze and synthesize patient data in order to review clinical decisions in a supportive and safe environment (Eppich, Cheng, 2015). Skill practice may enhance development of psychomotor skills, but it does not account for other factors that may impede performance for real patients. Simulation cannot replace working with real patients but it does mimic reality, providing an environment to practice skills and rehearse clinical situations, including making clinical decisions, problem solving in the safe way. Simulation allows students to practice in a risk-free environment, where they can develop both cognitive and psychomotor skills, and lets students to be self-directed and discuss clinical scenarios openly. Students can make mistakes and learn from the mistakes in the simulation (Tanner, 2006). While students are taking care of simulated patients with multifaceted issues, they must consider a variety of conflicts and complex factors in choosing the best practice. Using a high-fidelity patient simulator or a simulated clinical experience allows students to practice real-life nursing care in a simulated clinical environment (Yuan, Williams, Fang, 2011).

Most of the health related research involving high-fidelity simulation has been conducted in medical and nursing education with the focus on emergency care, advanced trauma life support, cardiopulmonary resuscitation, mechanical ventilation, or neonatal resuscitation. A number of studies have found simulation to be a valuable tool as a means of assessing and or improving knowledge acquisition and clinical skills. A few studies found simulation is an effective means of improving competence. Conversely, some studies demonstrated no significant improvement in knowledge and skills after simulation and no significant difference in confidence between students who participated in high-fidelity simulation and students who did not participate (Yuan, Williams, Fang, Ye, 2012) .

Reflection is focused on the debriefing that occurs a simulated clinical experience. Reflection and reflective practice are inherent to all phases of simulation leaning activities (Horton-Deutsch, Sherwood, 2017). It is crucial to bridge the gap that exists between what students learn in the classroom and how they apply what they learn in their clinical practice. Little research exists to ascertain student reflection of using high-fidelity simulation as an adjunct to or replacement for clinical practice. This paper will fill that knowledge gap. The paper was to elaborate and analyze the conceptual framework of reflection, the methods of reflection following high-fidelity simulation among undergraduate nursing students.

Conceptual Framework

Reflection is critical to cognitive leaning and experience learning. When learners participate in authentic activities, there should be time for them to step back and reflect on the experience. In cognitive learning, the individual learns by listening, watching, touching, reading, or experiencing and then processing and remembering the information. Learners perceive stimuli and decide how to process the information and use previous experience to guide their behaviors or performance (Horton-Deutsch, Sherwood, 2017). Knowledge is generated when an individual's perspective is transformed as a result of exposure to the situation in which students are required to put their thoughts into action. Simulation activity allows students to increase their confidence and competence in a safe setting, to integrate a full range of knowledge, attitudes and skills to respond effectively.

Reflective practice increases in cognitive complexity parallel to the increase in simulation complexity in order to measure the increases in student conceptual learning (Decker, 2007). Kolb (1984) defined the experience learning as the process whereby knowledge is derived from and continuously modified by experience. Knowledge results from the combination of grasping experience and transforming it. The learning process is viewed as a context of people moving between the modes of concrete experience (feeling--learning from specific experiences), abstract conceptualization (thinking--logical analysis of ideas and acting on intellectual understanding of a situation), reflective observation (watching--observing before making a judgment by viewing the environment from different perspectives) and active experimentation (doing--getting things done by influencing people and events through action).

Simulation based learning offers students a unique opportunity to learn through experience, aided by reflection and feedback and the opportunity to practice. Simulation is highly engaging, interactive and clearly relevant to practice and enables experiential learning in a safe environment while promoting students' in-depth reflection about learning (Cheng, Grant, Robinson, et al., 2016). In simulation based learning, students have opportunities to reflect on their experience, have a period of emotional release, receive behavioral feedback, integrate their observations, behavior and feedback into a conceptual framework and then create mechanisms and pathways for transferring learning to relevant situations (Yuan, 2013). Reflection is the opportunity to reexamine the experience. Students may think about what comes to mind first and work through the experience from that starting point. Student engagement in the simulation can also elicit significant emotional response which can redirect the attention of the student to reflect on their learning. Students need to be coached to be open to receive feedback in a way that facilitates positive learning rather than a negative response. Teachers want students to demonstrate successfully that they can transfer what they have learned and experienced from one situation to the next. Summative evaluation should be clearly indicated as such, and debriefing should be formatted in a confidential, respectful manner between the facilitator and the learner. Simulation based learning provides opportunities for the integration of feedback and reflection, which increases the learner's ability to synthesize knowledge from multiple sources and make sound and safe decisions. Integration of the simulation experience and facilitated reflection into a conceptual framework is one of the most challenging for simulation (Turricci, Lewis, 2017).

Reflective Learning In Simulation

Simulation based learning provides opportunities for the integration of feedback and reflection, which increase the learner's ability to synthesize knowledge from multiple sources and make sound and safe decisions. Reflection occurs throughout each phase of simulation: before, during and after the simulated clinical experience. Educators need to provide learners with a safe environment conducive to learning without compromising client welfare while fostering their analytical thinking skills and rational decision making. Reflective learning can assist the students to enhance their cognitive abilities, and offer students the opportunity to practice their assessment and organizational skills which prepare them to deal with the current level of acuity and complexity in real situation.

The Designed Scenarios

The scenarios had sufficient intrinsic interest for the students and relevance to clinical practice and lead students to a particular area of study to achieve specified learning objectives. The scenarios stimulated students to analyze the situations critically and provide alternative solutions to real-world problems, and motivated them to probe for deeper understanding. The trigger questions stimulated the students' thinking broadly and critically by encouraging them to achieve the specific learning objectives. The scenarios were designed using the high-fidelity simulator

which is a computer-controlled human patient simulator (HPS, SimMan) which is a full-body manikin with a realistic upper airway, chest movement, variable cardiac and breath sounds and a palpable pulse.

Simulation and Reflection

The foundation and inherent to the reflective processes are knowledge, skills, attitude, experience and emotion. During the simulation, students use the reflective practice to help them make sense of the experience. The reflective practice includes the phases of before action, in action, on action and beyond action.

For example, the simulated scenario is concerned a patient with Chronic obstructive pulmonary disease (COPD). Mr. Wang, a 68-year old man, was diagnosed with COPD 10 years ago. He has a 40-year smoking history (is still smoking) and has been hospitalized twice due to chest infections during the last 12 months. His vital sign: T 36.8 °C, heart rate 96/min (regular), RR 18 /min, BP 130/75mmHg. His FEV1 is 26% and FEV1/FVC is 38%. SpO₂ is 83 %, Two hours later, SpO₂ is 80 %, respiratory rate is 30 /min, heart rate is 116/min. He complained he has trouble getting his breath. The arterial blood gases are reported as pH 7.25, bicarbonate (HCO₃⁻) 23 mEq/L (norm 22~26 mEq/L), PaCO₂ 55 mmHg (norm 35~ 45 mmHg), PaO₂ 56 mmHg (norm 80~100 mmHg). The physician prescribed the low-flow oxygen therapy.

Reflection before simulation

The preparation of simulation includes the orientation to environment and simulator and reflection on knowledge, skills, attitudes, experiences and emotion. Students received an orientation to the simulation laboratory to familiarize them with the technology and the simulation format. Students were assigned readings to help them focus on specific learning goals prior to the simulation. To provide a consistent and coherent experience, these preparatory materials used the same patient details that students would later encounter in the simulation. The open-end questions are used to guide reflection as students consider any similar patients they have encountered in the clinical setting. The reflective questions are: "If you have encountered the COPD patient, what are that like? " "what are the feelings when you encounter the patients?" The students who have no experience may fear the unknown and expect the peers who have the experience can help them to diminish or accelerate their concerns. Students who encountered the COPD patients in the previous clinical placement might recall the interventions, the performed clinical skills, and administered medications, and patient record and their feelings during the interaction with the patients. Then, students were given a brief amount of time to review the scenarios and discuss their approach to care. The group discussions are focused on the following questions: "What are the meanings of FEV1, FEV1/FVC, and SpO₂?"; "What does the report of arterial blood gases mean?"; "What kinds of problems are there in the scenario?"; "What additional data would you collect? Why?"; "How do you manage the hypoxemia at this moment ?"

Reflection in action

During the enactment of the scenario, the students were expected to demonstrate an emotional connection and relationship with the patient to enhance realism. They performed assessments and interventions using appropriate techniques and adhering to principles of safety. They explored the breathless and the provoking and relieving factors, and then they check the blood pressure, pulse, heart rate and respiratory rate, lung sounds, heart sounds and bowel sounds, and abdominal palpation, etc. They also manage any complaint of the clients, such as breathless, vomiting, nausea, cough, thirst and hunger. Based on the health assessment and laboratory examination, students defined the problems which required nursing care and their priorities. Then they implemented some interventions following medical orders, such as oxygen therapy, medicine administration and observe the patients' physiological responses and reassess the patient conditions. Tutors observe group performance and give supportive help. In simulation, students are exposed to the simulated scenario and initially determine what is happening with the patient. When students recognize an unexpected or abnormal condition, they pursue additional information through health assessment and history inquiries. Then students develop the care plan and identify nursing interventions through group discussion. During the simulation, students are struggling or frustrated and need a pause in the action. Students reflect on the periodic pauses in the action. This can allow the students to reflect on previous and current knowledge, skills, attitudes, experiences, and emotions. The reflection questions during the simulation are: "Are there any 'time-out' or 'freeze frame' occurred? What are they?" ; "Why the SpO₂ is not improved when continue mask oxygen therapy is performed?" " How to manage the breathless for the COPD patients? What are different managements between the oxygen therapies to the patients with or without COPD?"

Reflection on action

Reflecting-on-action involves critical self-analysis of the identification of decision points, and acknowledgement of strength and weakness in both skill performance and reasoning patterns. During the debriefing, students reflect on their performance and identify further gaps in knowledge and skills. Tutors help students to discover their shortcomings or mistakes and guide them to realize what needs to be improved in further scenarios. Students reflect

on what has happened, how they responded, and what needs to be improved in the next session. The integration of feedback and reflection increase the students' abilities to synthesize knowledge from multiple sources and make sound and safe decisions. The tutor encouraged and allowed students to express their feelings and concerns, which contributed to their comfort with reflection. The students were not given the answer to the problem. The tutor allowed the students to take risks with their learning by letting them discover their own mistakes and explore their abilities. Students learned from their mistakes and thought about what need to be improved in further scenarios. Each group simulation was video-recorded.

A debriefing session followed each scenario in the simulation laboratory. It focused on team care of the patient in terms of safe practice, priority setting, continuous assessment, communication and resource management. Students review the select segments of video-recorded simulation and discuss the following questions: "What are your feelings during the simulation?"; "Are there any mistakes? What are they?"; "What were the key concepts and skills you used in this session?"; "What do you need to learn more about in order to take care of patients in similar situations?"; "How about your confidence in managing the breathless if you encounter the COPD patients again?".

Reflection beyond action

The reflection beyond action is conducted in post-simulation. Reflection beyond action includes reflection on performance and reflection on evidence-based practice.

(1) Reflection on performance

The students review the videos, and critique the individual performance in simulation. Students review key points related to care of the patient with the particular problems encounter in the scenario. They focus the discussions on a specific condition, pertinent nursing assessments and interventions or medications. They are also guided to reflect on patient safety concerns and patient-orientated care, teamwork and collaboration. The reflection questions are : "What do you think of the group performance in terms of knowledge, skills, attitude ? What needs to be improved in the next session?"

(2) Reflection on evidence-based practice

Reflection on evidence-based practice can foster students have a philosophy that incorporates evidence-based practice and access to tools that can enhance clinical practice. Students are guided to reflect on the nursing management, oxygen therapy and rehabilitation for the COPD patients. The reflection questions are: "What are the current practices in the nursing care of COPD?"; "What are the best evidences on dealing with the breathless for the patients with COPD? " "What are the best evidences on oxygen therapy for the patients with COPD? "; "What are the rehabilitation interventions for the COPD patients"; "How to perceive patients' abilities to perform activities of daily living after rehabilitation?".

Students search for the evidences and critically appraise the evidences in terms of the study valid, the results and discuss about whether the results be applicable in caring for patients under the guidance of tutors. Then, they compare the multiple studies to see if they are in agreement with each other, and summarize the evidences which can be used in the simulated situation. Finally group discussions are guided to think about the following questions: "Are there enough evidences on taking care the COPD patients? Why some of evidences are not appropriate for dealing with the simulated situation? This learning synthesis helped the students to generalize the learning from the specific situation to a more general one.

As indicated in introduction, we have two major research questions. One of them is to find out whether the inception of index futures trading has destabilized the underlying stock index or not. We will examine the volatility of the underlying index before and after the introduction of futures in order to answer the first question.

Conclusions

Students must consider a variety of conflicts and complex factors in choosing the best practice while they are taking care of simulated patients. It is more important to give the feedback and guided reflection during the simulation. Students need to be supported by tutor and collaboration in the learning process. The reflective learning in simulation occurs in the concrete experience, active experimentation (debriefing), reflective observation, and abstract conceptualization[16].

In addition, integrating simulation into existing curriculum structures requires faculty commitment to enhance their own teaching skills and redesign existing programs. Organizational commitment is also essential for this innovative teaching method due to the significant resources required for program implementation and ongoing financial support. Additional studies to test the impact of this teaching method on learner performance, patient safety, clinical outcomes, and faculty perceptions and cost efficiency will provide valuable support for using high-

fidelity simulation in nursing education. As transfer of skill from the simulated environment to the clinical setting is essential, further studies need to be concerned with the impact of using simulation on behavior transfer in clinical practices.

Acknowledgment

I wish to acknowledge the Macao Polytechnic Institute (code RP/ESS-06/2017) for providing funding for this research.

Reforms And Innovation In General Science For Effective Advocacy In Disaster And Risk Management

OEL TIU MAQUILING
jmaquiling@ateneo.edu

MINELLA ALARCON
minella.alarcon@gmail.com

Abstract

The Philippines is a country prone to natural and man-made disasters. These disasters have claimed many lives and have destroyed homes, properties and livelihood. Although we cannot prevent the occurrence of natural disasters, we can, however, mitigate their aftermath. It is the aim of this research to develop a disaster science curriculum for K-6 students in order to instill keen awareness, develop effective disaster science literacy, and equip our students and teachers with the requisite tools in active disaster and risk management. The methodology consists of three parts: (1) a survey of the disaster risk reduction practices and management of teachers and students in a particular urban division of city public schools; (2) an exhaustive review of the K-6 science curriculum to identify problematic key units (including the design and formulation of activities that address specific gaps in theory and practice); (3) pilot testing and incorporation of activities in the K-6 science curriculum. Results of the survey reveal that, although students may be aware of impending disasters and express profound concern for life and community, there is a gap in the scientific knowledge and disaster preparedness parameters that must be addressed by involving the entire community and linking said community to external institutes and resources in the entire schema of a disaster cycle. Knowledge gaps were recorded in the "fundamental law - process" linkages, especially those applied to real world problems. Review of the K-6 curriculum reveal a need to strengthen the key units in Matter, Motion and Energy, Physical Sciences, and Earth-Space Systems. Lessons and activities using the Active Learning approach have been prepared to address the specific gaps. Pilot testing of the activities is currently being undertaken to formalize the incorporation of disaster science into the current curriculum.

Relationship Between School Climate Perception And Sense Of School Belonging Of Secondary School Students And Academic Success

Seva Demiröz, PhD
Private Arı Schools
sevademiroz@hotmail.com

Abstract

Schools for education having primary importance are places where individuals spend their most critical years and get ready for the social life. There are a number of parameters affecting the quality of a school. Amongst these are the school climate and sense of school belonging. School climate that can be described as ‘character and quality’ of an educational institution is depicted as a feature developing based on the common perception of the persons in the school, impacting all persons in the school, influenced by their behaviors and having a relative persistence. Schools resemble each other in terms of physical formation; however each school is unique as a social formation and has its own characteristics. School climate can also become distinct in each school: physical characteristics, quality of interpersonal relations, demographic and cultural backgrounds of students, teachers, principals and other staff, shared norms and values may also affect the school climate. Students are affected the most by the school climate; it may favorably or unfavorably affect their success, compliance, friendships, attachment, and change sense of belonging. Sense of school belonging is students’ and teachers’ feelings about the school, interpretations about their experience in schools and thoughts about their role in the school. The aim of this study is to investigate relationship between school climate perception and sense of school belonging of secondary school students and academic success. The study is a descriptive study with relational screening model. The study group is composed of 340 6th and 7th grade students of a private school in 2017-2018 school year. In this regard, “School Climate Scale” and “School Belonging Scale” were applied to the students and average of their grades at the end of the first semester was taken as a measure of the academic success. Based on the data obtained, while a significant relationship was found between school climate and school belonging, no significant differences were found either between both school climate perception and sense of school belonging of the students with respect to their class levels and genders, or their academic success and perceptions of school climate and senses of school belonging.

Relationship Between Social Rejection / Acceptance, Self-Regulation Of Behaviour And Pupils' Perceived Satisfaction Of Basic Psychological Needs

Karla Hrbackova
hrbackova@utb.cz

Abstract

Social rejection of pupils may serve as an intensive psychosocial stressor. A certain form of social rejection can be found in almost every class in the school environment. The need to belong is a fundamental human need to affiliate with and be accepted by members of a group. Research shows that due to social rejection, which is accompanied by experiencing social pain, mechanisms supporting the individual's effort of reintegration into the group are not triggered. Paradoxically the opposite tendency arises, i.e., an increase in selfish and self-defeating behaviour. These mechanisms are associated with the ability of a person to regulate their own behaviour. The aim of our study is to find out the relationship between social rejection/acceptance, self-regulation of behaviour and pupils' perceived satisfaction of their basic psychological need for competence, relatedness, and autonomy. The sample consisted of 1133 Czech pupils in grades 6 – 9 (mean age 13). In our research, we assessed their social status by peer nomination and identified pupils who are socially rejected or accepted by their classmates and assessed the extent of applied self-regulation skills related to interpersonal cognitive problem solving (MEPS) and the satisfaction rate of basic Psychological Need for Satisfaction Scale in General. The findings suggest that the level of social acceptance/rejection is related to self-regulation of pupils' behaviour in interpersonal cognitive problem solving and is related to the satisfaction of basic psychological needs for competence, relatedness, and autonomy. At the same time, we found that in socially rejected pupils there is no obvious relationship between social rejection and the fulfilment of basic psychological needs. We have found an existing relationship between social rejection and self-regulation of pupils' behaviour, and also that self-regulation of behaviour depends on the degree of fulfilment of psychological needs. At the same time, we have found that the acceptance rate in the socially accepted group is not related to self-regulation of pupils' behaviour but is indeed related to the fulfilment of pupils' psychological needs and the extent to which these needs are met is related to self-regulation of pupils' behaviour. We have developed two models of interaction between these factors depending on the social rejection or acceptance. The possibilities of their implementation are being discussed.

Responsiveness Of Undergraduate Architectural Curriculum To Post-War Recovery In Syria: A Case Of Al-Ba'ath University, Homs, Syria

Abstract

When the current civil war ends in Syria, the post-war reconstruction needs many qualified architects who are well trained for post-war recovery. Architectural departments of the universities of Syria can contribute well to meet this requirement through proper training for their students. This paper attempts to identify the shortcomings of current architectural curriculum in relevance to post-war recovery in Al-Baath University, Homs, Syria, as a case study. For this purpose, a list of skills and knowledge required for efficient architectural learning on post-war recovery was developed through three stages Delphi technique and verified by local experts. Using content analysis and the developed list, the components of each subject of the curriculum is analysed. The results show that current architectural curriculum of the selected university, critically lack direct relevance to various aspects post-war recovery education. To meet the requirements for trained architects for post-war time, there is need to review the current architectural curriculum and improve it in relevance to post-war recovery.

Review Of The ‘Guided Writing’ Lessons Provided For Hearing Impaired Students¹

Guzin KARASU

School for the Handicapped Anadolu University Turkey

guzinkarasu@anadolu.edu.tr

Abstract

When the literature for the writing skills of hearing-impaired students is reviewed, it is seen that there is a need for researches regarding the manner in which writing lessons are performed. In this study, it is examined how guided-writing, a writing component of the Balanced Literacy Instruction Approach (BLIA), is performed with hearing-impaired students. This is a teacher research conducted through action research, with the participation of seven hearing-impaired students enrolled to the School for the Handicapped of Anadolu University in the 2015-2016 academic year. As a result of the study, it was determined that individual supports provided during the lessons increase the students’ motivation levels and writing lessons structured towards the improvement of certain skills bring benefits to the students. The guided writing component is thought to indirectly support the said improvement.

Keywords: *Hearing-impaired university students, guided-writing, teacher’s role*

Introduction

Written expression is a study in which emotions, ideas and events are narrated in a certain order. During the writing lessons, teachers should guide their students regarding the writing process and regulating it in order to ensure that the process affects the writing performances of the students positively (Fountas and Pinnel, 1996; Richards and Renandya, 2008). Writing process consists of the pre-writing, drafting, revising/editing and publishing stages (Cristie, Enz and Vukelich, 2003; Graves, 1983; Tompkins, 2000).

In the implementation of curriculums, various approaches are used for the improvement of both hearing-impaired and non-impaired students’ literacy skills. The effectiveness of the BLIA that supports the students in the amount required and when they need during the literacy lessons have been revealed in different researchs (Karasu, Girgin, Uzuner and Kaya, 2012; Kaya, 2012; Pressley, Roehrig, Bogner, Raphael and Dolezal, 2002; Schirmer, 2000; Uzuner, 2007; Uzuner, Girgin, Kaya, Karasu, Girgin, Erdiken et.al 2011; Wolbers, 2008). The approach, which aims to ensure that students become independent literates, advocates that students make decisions and selections on literacy subjects and control their levels of learning themselves, education reflects real living environments and lessons are performed in a metacognitive manner (Asselin, 1999; Fountas and Pinnel, 1996; Pressley et. al., 2002; Tompkins 2000). In the said approach, lessons intended for the improvement of writing skills are performed with the shared-, interactive-, guided- and independent-writing components. In the process from shared-writing to guided-writing, the student is initially dependent on the teacher during the lessons performed in line with the abovementioned principles. With the improvement ensured on the student’s writing skills during the process, the amount and type of the support given to him or her changes. The teacher’s role is to ensure students’ improvement with the support he or she provides.

Writing skills of BLIA, namely the shared-, interactive-, guided- and independent-writing, are seen to offer a hierarchical process. When certain skills are acquired by the students, they start to write texts by use of the features of the next stage (Tompkins, 2007). However, when the teacher realizes a need through various evaluations carried out during the lessons, previous stages can be brought into use again in order to make repetitions (Karasu and Uzuner, 2018; Richards and Reynandya, 2008; Wolbers et. al. 2018). In shared- and interactive-writing, a single common text is written on the board. While it is the teacher who always holds the board marker in shared-writing, in interactive-writing, both the teacher and students write on the board as required (Cristie, Enz and Vukelich, 2003). In the next stage, guided-writing, each student writes a text. While the text is written by a student, the teacher checks it and provides support by making corrections if necessary. In the first three stages, subject determination and pre-writing are done together with the teacher. On the other hand, in independent-writing, subject determination, pre-writing and drafting are all done by the student (Cristie, Enz and Vukelich, 2003; Tompkins, 2000).

Students who experience problems in the improvement of writing skills need to be taught how to write (Cristie, Enz and Vukelich, 2003). For teachers and researchers who perform lessons based on the principles and components of BLIA, the question “How?” is answered through another question: “Which writing component is to be implemented in the writing lesson?”. The writing component to be used is determined as a result of the formal

¹ This study was supported by Scientific Studies Research Projects, Anadolu University (Project number: 1505E440).

and informal evaluations carried out by the teacher. Since this study is about the manner of implementation of guided writing in writing lessons for hearing-impaired young persons, guided writing is addressed in details.

Guided Writing. Guided writing is performed with students who have already acquired certain information and skills of written expression with shared- and interactive-writing. As is known, writing is a complex skill requiring the joint use of certain processes and strategies. In this process, especially for individuals experiencing difficulties in writing for various reasons, guided writing is implemented for a certain purpose (reinforcement of the text structure knowledge, teaching the strategy for founding out the meaning of words based on the text, answering of cloze-type questions, etc.) with the whole class or small student groups requiring support on a certain matter in the class. Other features of guided writing can be listed as follows (ILA; 2018; Tompkins, 2007; Wolbers, 2008)

- Subject selection and the pre-writing stages of the writing process are performed together with the teacher. Each student writes a separate text individually.
- Twenty-minute lessons are planned for small groups with similar needs. The time can be extended to one full class hour for students in higher age groups.
- While the students write their texts, the teacher walks around the students and provides instant feedback. He or she teaches the writing strategies, skills and notions and the way to be followed in writing. Only one or two strategies should be taught in one lesson.
- In the guided writing process, the teacher acts as a model intensively, in particular about the implementation of the review and correction stages.
- After the texts are written by the students, the texts are reviewed and corrected during group language lessons or individual writing correction studies.
- After the students finalize the process, it should be ensured that the texts are shared in various ways. Such sharing is important in providing the students with the opportunity to experience the whole writing process for the texts written.

In shared- and interactive-writing, the teacher acts as a model in teaching the strategies and structuring of the sentences to be written. On the other hand, in guided-writing, while the teacher continues to act as a model when needed, the students make internal dialogues and the teacher should motivate them to realize such dialogues (Baker, Gersten, and Graham, 2003). Internal dialogues are known to help students to become independent or better authors (Wolbers, 2008). In the said process, they learn metacognitive strategies by questioning and controlling themselves (Schirmer, 2000).

It is important to repeat works on a daily basis (French, 1999), since literacy is supported during guided writing while the students actually talk, think and question through the text. They at the same time question themselves in written and gradually assume responsibility regarding the level of their learning. The teacher plays an important role in all these processes (Wolbers, 2008).

According to Wolbers (2008), French (1999) emphasizes the importance of the teacher in playing his or her role in a proficient and sensitive manner. French (1999) states the roles to be played by the teacher as accepting or, if needed, properly interpreting and reformulating the language/sentences of the students; acting as a model in the strategy of writing by thinking aloud; providing support to the extent needed (providing verbal scaffolds); delegating the control gradually to students; ensuring that all students are active in the process; and ensuring a correct timing of asking questions, giving explanations, listening to students, acknowledging and giving suggestions. While improving the students' writing skills, the teacher should plan the lessons so as to support the improvement of the other components of language, namely reading/comprehension, listening and speaking skills (Cambra, 1994). Frequent implementation of reading/comprehension activities in the guided writing process would indirectly support the development of the students' knowledge of language (Wolbers et. al., 2018).

Another critical role played by the teacher in BLIA is about the use of different writing components. The teacher should be able to make returns among or repetitions on shared-, interactive-, guided- and independent components. Through the ongoing evaluations he or she carries out, the teacher monitors the development of the students and makes plans and decisions regarding the present and future lessons (Karasu and Uzuner, 2018; Richards and Reynandya, 2008; Wolbers et al., 2018). As an example, he or she decides when and how to pass on to shared-and/or independent-writing from the guided writing lessons; or after starting a lesson with guided-writing, he or she can decide to continue by passing on to shared-writing if necessary (Wolbers et al., 2018). To give place to returns among and repetitions on different components in the approach is important in particular for hearing-impaired students, who experience limitations in language (Schirmer, 2000; Rupley, Blair and Nichols, 2009).

When the literature on the writing skills of hearing-impaired students is reviewed, international publications are

seen to address certain subjects in certain periods up until today. While the initial researches focussed on words and syntax in relation to literacy (Albertini and Schely, 2003), the perspective towards the teaching of writing changed in 1970s and the limitations of sentence-level language and writing teaching was started to be discussed (Krestschmer and Krestschmer, 1978). Teachers began to ask students to write free texts about their own life experiences or diaries instead of writing in a certain matter. It was determined that the interaction during the writing process affected positively both hearing-impaired and non-impaired students who are timid in to writing (Graves, 1983; Truax, 1985). The study conducted by Gormley and Sarachan-Deily (1987) to determine the strengths and weaknesses of hearing-impaired students in writing is considered important. In 1990s, the related literature concentrated on the examination of sentence and story structures expressed by hearing-impaired students in different age groups and the teaching and use of strategies (Cambra, 1994; Klecan-Aker and Blondeau, 1990; Yoshinaga-Itano and Downey, 1996). Following researches (Mayer, 2010; Strassman and O'Dell, 2012), in which studies towards the enrichment of text content through syntax and meaning, shows that the writings of hearing-impaired students reflect similar characteristics and ideas when compared to the writings of their non-impaired peers.

In recent years, the studies conducted by Wolbers et. al. (Wolbers, 2008; Wolbers, Dostal and Bowers, 2011; Dostal and Wolbers, 2014; Dostal, Wolbers and Kilpatrick; 2016; Wolbers et. al. 2018) to address interactive-writing as a component of BLIA have become prominent. Four different researches are seen to exist in the literature, regarding the correction stage of the writing process. However, while those studies address the mistakes done by hearing-impaired students, any discussion about the process of correction is not presented (Crawford, Lloyd and Knoth, 2008; Gormley and Sarachan- Deily; 1987; Livingston; 1989; Yuknis; 2014).

The first study on the writing skills of hearing-impaired persons in Turkey was done by Tuncay (1980) regarding the effects of hearing impairment on the written expression skill. When the researches that can be accesses are classified based on their subjects, two different subjects are seen to be addressed. The first one is the researches focussed on the strength and weaknesses of the writings of hearing-impaired students who receive education in different environments (Efe and Karasu, 2017; Erdiken, 1996; Girgin and Karasu, 2007; Karasu and Girgin, 2007). The second subject is the approach to be used in the pre-writing and writing stages, the activities that can be performed and their effectiveness (Alath and Servi, 2017; Erdiken 1989; Erdiken, 1996; Karasu and Uzuner, 2018; Karasu, Uzuner & Beral, 2018).

The researches done by Erdiken (1996) and Karasu (2004) for the development of measurement tools for the evaluation of hearing-impaired students' written expression skills as an important component of the writing process are considered important. Another study of Karasu (1024) addresses the types, units and methods of correction needed to be implemented for hearing-impaired students in writing correction studies. In addition, the literature includes a research conducted to determine the problems encountered by hearing-impaired students while creating texts in the writing process (Tiryaki, 2014), and another research in which the reading comprehension and writing skills of hearing-impaired students with cochlear implant are compared (Cizmeci ve Cirput, 2018).

Writing researches are seen to address the effectiveness of teaching approaches, strengths and weaknesses of students, problems and cause-effect relationships related to the writing process. There are limited number of researches related to the subject of this paper, namely the writing process, stages of the writing process and the writing implementation of BLIA. In the literature, it is specified that there is a need for qualitative researches about the way of implementation of writing process stages for the improvement of students' writing skills (Karasu, 2014; Yuknis, 2014). In addition, it is suggested that researches to be conducted by teachers would be more effective with the advantage of field application (Vostal and Ward, 2015). In this direction, the objective of this study is to examine the implementation of guided writing for hearing-impaired university students as a component of BLIA.

Methods

This is a teacher research done through action research. In action researches conducted by teachers, teachers analyse their own practices or a problem or action in a systematic and regular manner (Johnson, 2002). However, while supporting the learning process of students, they also contribute to the professional development of teachers (Creswell, 2005). In action researches, after the problematic situation is determined, data collection, data analysis, action planning, trustworthiness committee meetings and reporting are performed in a cyclic manner. Figure 1 shows the cyclic process of an action research.

Figure 1: Action research cycle (KNILT, 2011)

Setting

The research was conducted at the School for the Handicapped of Anadolu University, which is the only institution providing higher education to hearing-impaired university students. The education is provided for the Graphical Design and Ceramic undergraduate and Building Drafting and Computer Operation associate degree programs. Research data were collected in the language class 214 of the School. Sound insulation was provided for the class and other physical properties of the class were arranged in line with the needs of hearing-impaired students (Girgin, 2003).

Participants. The research was conducted with the participation of second year students enrolled to the Computer Operating associate degree program in the 2015-2016 academic year. Other properties of the students regarding language skills are given in Table 1. Communication was made with Whole Language. Before the research, the participants were informed about the objective and procedure of the research and signed consent letters were obtained.

Table 1: Student Properties

Student	Age Gender	Degree of hearing loss (better hearing ear)	Age of onset of hearing impairment	Age of diagnosis	Age of onset of hearing aid	Secondary education environment
1	23/M	113 dB HL	Congenital	1	2	Vocational High School
2	22/F	101 dB HL	0.10	0.10	2	
3	25/F	96 dB HL	Congenital	1	14	
4	19/F	110 dB HL	Congenital	2	19	
5	22/M	118 dB HL	Congenital	6	-	Vocational High School for Hearing Impairments
6	25/M	83 dB HL	Congenital	5	12	
7	23/M	70 dB HL	Congenital	11	16	

When the written expression levels of the students were reviewed before the research, it was seen that the level of knowledge of five students about text structure was very limited and they could not include titles in their writings. On the other hand, when the content of their texts were reviewed, three of the students were seen to provide suitable content, while another three of them were unable to write in line with the instructions given. One student was understood the need limited support. All students were observed to have limitations in terms of syntax, vocabulary and orthographic rules and punctuation and be in need of intensive support.

Researchers. The research team consisted of one advisor and two researchers who all had 21 years or longer experience in the education of hearing-impaired students. They have graduate or postgraduate degrees in the field of hearing-impaired students' education. The research team members, who lecture at undergraduate and graduate levels, took part in conferences about qualitative conferences and participated in projects are implementers or

researchers. Their researches were published in national and international peer-reviewed journals.

Data collection techniques and analysis

Both qualitative and quantitative data collection methods and techniques were used in the research. The research data consists of video recording of the actual classroom interactions (33 h and 4 min), 11 writing lesson plans and reflections, reflective journal entries, students' artifacts, archival data, (audiograms, the official records of the students) and criterion referenced tests. The data collected were analysed through the inductive method, results obtained were reported by being associated with each other and the literature.

The validity study was done through the inspection of the research process, data and implementation qualification by the trustworthiness committee (Creswell, 2005). Ten trustworthiness committee meetings were held between 18th of September 2015 and 9th of February 2016. (trustworthiness committee meeting minutes)

Quantitative data of the research were collected with criterion referenced test in order to determine the level of improvement in the writing skills of the students. The preliminary and final tests were performed on 5th of October 2015 and 12th of January 2016 respectively. The students were asked to provide five written expression data including three newspaper reports and two expository texts on different topics. For determining the suitability of written expression questions for the ages, levels and areas of interest of the students, a validity study was conducted by receiving expert opinions. Vocational education and needs of the students were taken as the basis in determining the types and topics of the texts.

The texts were then evaluated by use of the "Written Expression Skills Evaluation Tool" developed by Erdiken (1996). Written texts were evaluated for text structure (0-30 points), content (0-20 points), grammar (0-25 points) and orthographic rules/punctuation (0-5 points). The inter-evaluator reliability, which was calculated with the *Agreement / Agreement + Disagreement X 100* formula, was found to be 84.8% and 71.9% for the preliminary and final tests respectively. On the other hand, implementation reliability coefficient of the lessons performed based on the principles and components of BLIA was calculated to be 94.5% with the *Observed Implementer Behaviour / Planned Implementer Behaviour X 100* formula.

Findings

In this section of the paper, firstly the research process is explained in brief. Afterwards, the answer to the research question is given.

Research Process

This study includes the analysis of the data collected in the implementation process of the research, which consisted of the pilot study and implementation processes. The data were collected between October of 2015 and January of 2016, in the Speaking Skills for Computer Operate Training III lesson. Total duration of the lesson was 135 minutes with three 45 minutes lessons (3x45 minutes).

Implementation of the Guided Writing Process with Hearing Impaired University Students

During the implementation process of the research, nine different newspaper report and expository texts were written by use of the BLIA components. Table 2 shows the writing components, topics and dates of the texts. Three of the texts were written with guided-writing. In this study, the writing process of the "Technology news writing" topic, performed on 22nd of December 2015, is presented, since it reflects all features of guided-writing.

Table 2: Writing components, topics and dates of the texts

BLIA Writing Component	Subject and Date of the Text
Interactive Writing	Writing a Facebook message (6 October 2015)
Interactive Writing	Content analysis of the school newspaper (27 October 2015)
Guided Writing	Y. Buyukersen Wax Museum Trip (6 October 17-18 November 2015)
Independent Writing	Writing a text with the topic of choice (3-10 November 2015)
Interactive Writing	Yılmaz Buyukersen's life (24 November 2015)
Guided Writing	Technology news (1-22 December 2015)
Interactive Writing	Comparing the features of websites (15 December 2015)
Independent Writing	Writing news with the topic of choice (1 December 2015-5 January 2016)
Guided Writing	Thoughts and feelings about Facebook (5 January 2016)

The text topic was determined by the teacher taking into consideration that the students were enrolled to the Computer Sciences Department and they were in need of reading texts with computer and technology content. Although it is important in BLIA that the students make topic selections and decisions, it is also important that the topics are determined sometimes by the teacher and sometimes by the students in a balanced manner (Pressley, Roehrig and Bogner, 2002; Tompkins, 2007). The role of the teaching in the establishment of this balance is critical (Wolbers, et. al., 2008). Besides, it is important to ensure that reading and writing skills are improved together, since different language skills indirectly support the improvement of each other (Cambra, 1994). Before the guided writing lesson on 22nd of December 2015, two interactive-writing, one guided writing and two independent-writing studies were conducted with the students. In the said writing components, the amount and implementation of the support given to the students differed. Based on the evaluations made before, during and after the lessons, the research team decided at the trustworthiness committee meeting dated 18th of November 2015 to implement guided writing in the lesson after the two independent-writing studies. (trustworthiness committee meeting minutes dated 18th of November 2015) Different stages of the sample writing process performed through guided writing are presented below under the titles pre-writing, drafting, writing, review, correction and publishing.

Pre-Writing Stage. The pre-writing stage was performed both before and during the lesson. The writing topic was announced to the students both in written and verbally during the lesson on 1st of December 2015. The teacher wrote the instructions on the board and asked the students to copy them in their notebooks. The instructions were “Please review the newspaper reports and select one report in the field of technology (computer, mobile phones, automobiles, etc.). You will present the news you select in the classroom both in written and verbally. Deadline is 15th of December 2015”. The students were also asked to select another report they are able to understand and change their selection, if they are not able to comprehend what they read.

Although it was announced to the students that they would present the selected technology report on 15th of December 2015, the lesson could be performed in the following week, on 22nd of December 2015, since the correction of the written texts took longer than expected. The reason of delay was explained to the students. (Lesson plan evaluation dated 15th of December 2015)

In the class part of the pre-writing stage, the technology news reports and expository texts selected by the students in the internet and from the newspapers were reviewed. This ensured students (except one of them) to perform reading comprehension works before the presentation lesson about the texts they would present, and attend the lesson ready. (Lesson plan evaluation dated 15th of December 2015)

At the beginning of the lesson, the teacher reviewed the technology news reports brought by the students as they attend the classroom and became informed about the content of the reports. Afterwards, each student presented his or her news report at the teacher’s stand they explained the points that cannot be understood by use of sign language or by writing on the board (Figure 2). When the meaning of a word is not known or the news report cannot be understood with the narration of the student, the teacher made written and oral explanations with the help of other students who can effectively use the sign language. At the end of each presentation, the presenter asked “Do you have any question?” In case there is no question from the class, the teacher asked several questions in order to make repetitions on the report. The pre-writing stage took 31 minutes for being completed.

Figure 2: A student presenting her news report

Drafting and Reviewing Stage. Since the writing was made through guided-writing, “drafting” and “review” stages were performed at the same time. Each student selected his or her own news report or a news report presented by one of his or her friends and wrote the related texts individually. It was seen that the ability to select

a news report presented by others increased the level of motivation. It is thought that it was because the students who had difficulty in comprehending the text they presented had the chance to write other news reports that was discussed and repeatedly explained in the classroom. (Reflected Evaluation of the Lesson Dated 22nd of December 2015)

The students were observed to make progress in terms of “text structure and content” in the previous lessons. Thus, the teacher focussed on the correct writing of “words and affixes” during the review in the lesson dated 22nd of December 2015. While the students were writing their texts, the teacher walked around the classroom and reviewed the texts written. In case there was a problem in the writing of words or affixes, the teacher gave information in written and/or verbally about the tenses required to be used in writing of newspaper reports and corrects uses of words by asking questions such as “It this word written correct?”, “How do we write the word ‘screen’?” and “Did you see this incident? In which tense should we write?” (Karasu and Uzuner, 2018). When necessary, he or she received sign language support as well. With these supports, the teacher asked the students to correct their mistakes. (Figure 3) The teacher considered the level of the student when deciding to correct a mistake directly, or ask the student correct is him or herself by directing questions (Pressley et. al. 2002; Tompkins, 1997; Wolbers, 2008).

The drafting and review stages performed at the same time took between 5 and 11 minutes to be completed. The time spent for the writing of the texts was dependent on the language skills of the students. Students with higher level of language skills completed writing in shorter time (Marcschark, Lang and Albertini, 2002).

Figure 3: Examining the writings and giving feedback

Editing Stage. Reviews made during the writing of the texts through guided writing by hearing-impaired students are not considered sufficient. For this reason, the researcher conducted nearly 10-minute “Individual Writing Editing” studies with each student after the completion of drafting. (Figure 4) While the researcher was doing editing studies with each student, other students were ensured to work in groups of two. During the said “peer studies”, they were asked to read each other’s writings and make editing. However, the editing capacity of the students was seen to be limited (Gormley and Sarachan-Deily, 1987). Editings for words, syntax, orthography and text structure were made with each student (Karasu and Uzuner, 2018). During the editing, problematic grammar rules were not brought to the students’ attention, while the sentence structuring requirements imposed by the rules and the effects of such structuring on the meaning were emphasized (Karasu, 2014). Individual text editing took 50 minutes.

Figure 4: Examples of individual writing editing

Publishing Stage. In this stage, each student read aloud his or her text in the classroom, accompanied by sign

language performed by him or herself or another student. Presentation of the texts in this way took 7 minutes.

Two lessons were combined in a block lesson. Pre-writing, review and drafting took 42 minutes, while 58 minutes were spent for individual mistake correction and publication. A break of 15 minutes was given between the two activities.

Pre-test and final tests were applied to determine the effectiveness of the lessons performed with the principles and components of BLIA. As seen in Figure 5, all students made progress in terms of written expression skills, even if limited.

Figure 5: Impacts of the application of writing process activities

Writing is a complex skill requiring the joint use of different skills. This kind of studies conducted with hearing-impaired students would be more effective if done in longer period of time. It is thought that the studies done three times during the research indirectly affected the improvement of the students' written expression skills. Another reason of this result is the hearing-impaired students' need for more repetitions, because of language limitations (Luckner and Cooke, 2010; Paul, 1998; Rupley, Blair and Nichols, 2009; Schirmer, 2000).

Conclusions

The lessons performed in line with the principles and components of BLIA were seen to bring benefits to the hearing-impaired students, even if limited. It is thought that the guided writing studies done three times during the research indirectly affected the improvement of the students' written expression skills. It is very important to support hearing-impaired students in accordance with their language levels and when they need. In this study, in which different BLIA components were implemented, the contribution of each approach to the development of the students was valuable.

In the guided writing stage of the research, the attention of the students was brought to syntax and orthographic rules, taking the progress made by them into consideration. However, since reading and writing teaching requires a complex and long process, it is important to perform subsequent lessons in a planned, systematic and regular manner, so as to improve all features of writing. In this context, evaluations made before, during and after the lesson are critical. It is important for the teacher to plan his or her lessons in advance through continuous studies.

The way in which the lesson was performed was seen to increase the level of motivation of the students. Focussing on just two skills during the review stage made it easier for the students to cope with the skills expected to be improved. It was ensured that the students' experiences regarding the review of the correct writing of words and affixes were reinforced. In the individual correction stage, repetitions regarding text structure and content were made in addition to the emphasis on the writing of words and orthographic rules.

Results of the research revealed the effectiveness of writing lessons. However, it must be taken into consideration that it takes long time for hearing-impaired students to improve language skills, they need intensive repetitions and lessons are required to be performed in a systematic manner.

In the light of the data obtained with this study, guided writing lessons can be planned for hearing-impaired

students. In addition, the research can be repeated in different education environments, with different participants and by different researchers for the generalization of the findings.
